ON LORD ROTHERMERE'S TASK.

Rumour, as persistent as ever, insists that Lord Rothermere intends to resign his office as Air Minister. It is earnestly to be hoped that he will do nothing of the kind, for it would be a difficult task to replace him, and, moreover, all the months which he has spent in his present position learning what he has to do would be wasted.

Those who have come in contact with Lord Rothermere are unanimous on two points, firstly that he is intensely in earnest about aviation, and secondly that he knows nothing about aviation. Both are virtues. The former gives promise of efficiency in the future. The second guarantees that he is free from the little knowledge which is such a dangerous thing for those who have to deal with a highly technical subject.

Lord Rothermere took Lord Cowdray's place just when Lord Cowdray was beginning, as an engineer, to know something about aircraft. Lord Rothermere came in as a business man with a great reputation as an organiser. Organisation was what the Flying Services needed, and still need. Lord Cowdray and Sir William Weir, despite their limited powers under the old Air Board scheme of 1917, had done wonders, as the present predominance of the R.F.C. in France clearly shows. Lord Rothermere, with the full powers of a Secretary of State, is in a position to do still more.

He began by having a wholesale clear-out of certain departments. On what advice he did the clearing-out is not known, but the fact that most of those who were cleared out of the Hotel Cecil by the front door promptly came in again by the back door suggests that his advisers were not as clever as they thought they were. At any rate the said back door has permitted several good men to go on working for their country.

Since then Lord Rothermere has learned much about the system and the people with whom he has to deal, and that, after all, is more important than learning technical details about the matériel of his Service. This is especially the case since he has two such able engineers as Sir William Weir and Sir Henry Fowler to look after the production side.

The Benefit of Impartiality.

The chiefest point in Lord Rothermere's favour is that he has no axe to grind. He is not a political adventurer seeking for either pay or power. Nor is he a Service politician looking for a post which might satisfy his ambitions. He has all the money he wants—thanks to his newspaper connections. So far as it is humanly possible to judge another man's motives, it seems that he is in his present position because he was put there on account of his reputation as a business organiser, and he is stopping there against his inclinations because he wants to do his duty by his country.

Even if Lord Rothermere were not the strong man and the great organiser which he is reputed to be, he would still be doing good by remaining as Air Minister, for at any rate he would make it impossible for men of dangerous ambitions, or for political busybodies, to get hold of his powers. If he did nothing except sit in his chair and let the Army run the Royal Air Force, he would still be serving his country better than most people are doing during the war.

If, as is to be hoped, Lord Rothermere retains his post for another six months or so, by which time he will have got a fairly good grip of the situation, we may expect really great effects from his organising ability. If in the meantime he does not act in any way, but merely spends his time in learning, he will do good.

Some Things for Attention.

During this period of education there are a few things to which he might direct his attention, because they require no technical knowledge, but merely common sense. For instance, last week the papers—anyhow the Harmsworth papers—were pervaded by a silly paragraph which chortled over the abolition of Staff tabs in the R.A.F., and eulogised the change as an indication of Lord Rothermere's determination to abolish red tape. "Red Tabs and Red Tape Abolished" was the alliterative heading of one paper.

Possibly one is growing old and fossilised, but one confesses to a respect for a moderate use of red tape. It is a neat, clean, and orderly commodity, which is used to produce similar qualities in the people on whom it is inflicted. As one has pointed out before in this paper, a roll of red tape, as a symbol of the methods employed by the War Office, is vastly preferable to the corresponding symbol for the Admiralty, a bunch of cotton waste.

Without material red tape chaos would ensue among official documents. Without moral red tape mental chaos is produced. Which accounts largely for the state of chaos at the Hotel Cecil, and also accounts for it and its ancillary groups of buildings being known among Service humorists as the Hotel Bolo, Bolshevik Mansions, Soviet Chambers, and Trotsky Rents, respectively. One of Lord Rothermere's tasks is to get everything neatly taped up, instead of merely exhausting himself in trying to push the mass along in front of him, as one very able official stated to be the only conceivable method of speeding up the working of the Air Ministry.

The Beauty of Tabs.

In much the same way Staff Tabs are not merely ornamental. They are of very great utility. If anyone wants a practical proof of the fact let them read that brilliant exposition entitled "The Great Tab Dope" by Colonel Swinton. Apart from being excruciatingly funny, it is a very sound piece of philosophy.

The Staff Officer must be distinguished from the ordinary executive officer if he is to do his work properly. It is the fashion to laugh at the Staff of the Army, but as a matter of fact the Army's Staff work for the last two years has been magnificent as a whole. Probably it is the finest in the world, not excepting that of the

German Army. If it went to pieces in the first year of the war, it was merely because, thanks to our pacifist politicians, we had only a few dozen trained Staff Officers to do the work for which as many hundreds were needed. It takes years to make a good regimental officer, and it takes a couple of years of special education to make a good regimental officer into a trained Staff Officer. And even then a special type of brain is required for Staff work. The finest fighter or leader of men may be a dire disaster on the Staff.

Owing to the nature of his work, it frequently happens that a junior Staff Officer, say a Staff Captain, has to issue orders to majors and colonels commanding units. In order to give him the necessary authority it is essential that he should wear some distinguishing badge. Does anyone imagine that a wing commander or a squadron commander R.A.F. would have any authority or would be able to obtain any attention to his opinions outside his own command if he wore no rank badges? Staff tabs are merely a mark of the authority which has been delegated to the wearer by the High Command, and they are as necessary as any other mark.

One strongly commends to Lord Rothermere the retention of Staff Tabs, not necessarily red, but nevertheless tabs. The æsthetic French grey of the R.F.C. Staff is excellent for the purpose. It suits the complexions of most of its wearers, and it is quite distinctive. Everybody in the Army knows what it means, so why not keep to it?

That Uniform.

Another little matter which demands attention which Lord Rothermere can give without incurring undue mental strain is the matter of that fearsome R.A.F. uniform. An apparently inspired article in the press on Saturday last, after remarking that "the fusion must obviously lead to increased efficiency"—which is neither obvious nor even probable—goes on to say that "with a view to putting an end to old jealousies and fostering a loyal *esprit de corps* in the new Force, the authorities emphasise the desirability of all members of it appearing in the new uniform as soon as possible."

Of course, being companions in misfortune does certainly promote *esprit de corps,* but there is no need to make the misfortune so great. It would have been just as easy to have lightened the misfortune by designing a decent uniform instead of letting a naval outfitter or a theatrical costumier loose on it.

The Horrible Hat.

First of all that horrible hat needs reforming. The naval cap in khaki is the ugliest headgear on earth. Why not go back to the Army hat?

Secondly, the glorified black bootlace round it makes it still worse. Why not have dark or light blue cloth, if there must be anything other than a khaki band?

Thirdly, the cap-badge is an atrocity. Why have all that gold lace stuff? It looks gaudy when new, and unutterably shabby when old. It cannot be cleaned or polished. It is needlessly expensive. And its design is too appalling for words. Why cram a bird and a crown and the two things below onto one badge?

Incidentally, what are those things underneath? They look, as one said recently, like the antennæ of a brass beetle. The pilots call them bananas. They might be a naval outfitter's attempt at palm branches of victory, or the olive branches of peace. Or perhaps they are an intelligent anticipation of General Salmond's historic despatch to Lord Rothermere, in which he said that our aviators had their tails well up, and so may express the exalted tails of horses.

How would one express that heraldically? Two horse-tails crossed rampant *or* on a field *sable*? A truly pretty conceit. If so, why not complete the jest and add underneath the motto already suggested, "*Sursum Cauda*"? Yes! One knew before it was first written that it was shocking bad Latin, but Heraldry is full of bad Latinity, especially in punning mottoes. At any rate, it is a more cheerful motto than the somewhat lugubrious "*Per Ardua ad Astra.*"

And, anyhow, why have all that clutter of bullion on the front of the cap when it could all be got into one neat metal badge like that of any of the distinguished regiments in the King's Army?

After that, why have wound-stripes on the cap by way of rank badges? Why not small stars? And if rank marks must be carried on the cap, why have two for a captain, when every soldier in the Army only knows of three stars as indicating that rank? After all, the Army is the predominant factor in these days, so it is necessary to the dignity of the Air Force that the Army should recognise its ranks. Yet the great brains who perpetrated this atrocity of a uniform seem to have gone out of their way to make such recognition difficult.

The final touch about the cap is in making a mere squadron commander, a major, into a full-blown "brass-hat" by loading his peak with gold leaves. The one thing both Navy and Army know is that a brass-hat denotes exalted rank, so it is ridiculous to make a major who is not even on the Staff into the equivalent of a colonel in the Army or a commander in the Navy. Also all this gold decoration adds to the major's expense of living if he believes in looking smart, and makes him look shabby if he is inclined to be careless.

The Jacket.

The rank badges on the jacket are equally badly designed. For the sake of officers serving on board ship it may be well to preserve the two Navy stripes, but they tell the soldier nothing about the wearer's rank, although the majority of the R.A.F. will always be serving with the Army. So why not keep the stars on cuff or shoulder-strap? If the stars would be too much like the Army, then why not use small worsted or silk wings, corresponding in number to Army rank: two for a lieutenant and three for a captain? There is no need whatever for the brass bird and crown above the stripes. They will be constantly torn off, and when they stop on the cuff they will wear out the linings of overcoats.

Finally, what about the belt? It is rumoured that officers will be allowed to wear a leather belt instead of the useless and ugly cloth contraption with its big brass buckle, which is at present regulation. If so, why not stick to the cross-strap as well, and so make the Sam Browne regulation wear? It is the one thing which distinguishes an officer at first glance in these days. Its absence makes it difficult to recognise the status of some of the R.A.F. Generals even. The Americans and French have taken to it. The R.N.A.S. on foreign service, and the R.N. Division, wear it. So why refuse it to the Air Force?

The costumier who designed the whole R.A.F. outfit has succeeded in making it gaudy without being neat, so it will be wise to nip this gaudy flower in the bud, and make a workmanlike job of it. These are just a few of the little things to which Lord Rothermere might give his attention in his spare time while he is learning more about the bigger questions of organisation.

The R.A.F. is going to be a very fine show when it settles down to its work. It was a mistake to make the change in the middle, or perhaps one should say at the beginning, of the war. It was a bigger mistake to remove competition, and thus substitute internal intrigue in one Force for healthy rivalry between two or even three Services. But this will be overcome in time. Therefore it will be just as well to settle such superficial but highly essential details as matters of uniform at the very start.—C. G. G.

THE KING AND THE R.F.C.

The King sent the following telegram to Sir Douglas Haig on March 27th :—

"I wish to express to General Salmond and all ranks of the Air Services of the British Empire in France my gratification at their splendid achievements during this great battle.

"I am proud to be their Colonel-in-Chief."

"George R.I."

The following Special Order of the Day, dated March 27th, has been issued :—

To His Majesty the King, Buckingham Palace, from Field-Marshal Sir Douglas Haig.

General Salmond and all ranks of the British Air Service in France desire to express their most loyal and heartfelt thanks for your Majesty's most gracious message. They are specially proud to think that they are rendering good service to their King and Empire at this critical period of the war, and the knowledge that they have won the appreciation of their Colonel-in-Chief inspires them to still greater efforts.

THE AIR MINISTRY AND THE R.F.C.

The following telegrams, which have been exchanged between the Air Ministry and General Salmond, G.H.Q., France, were published on March 27th :—

The Air Council congratulate you and all ranks of R.N.A.S., R.F.C., and Australian Flying Corps on the splendid work carried out during this great battle.

We are all following their great deeds, and know that they will keep it going.—Air Ministry.

* * *

Very many thanks for Air Council's congratulations, which are much appreciated by all concerned.

All ranks have their tails well up, and the superiority of British over enemy airmen has never been more marked.—General Salmond.

THE KING AND THE R.A.F.

On April 1st the Royal Naval Air Service and the Royal Flying Corps were merged under the new scheme into one body, the Royal Air Force. The King marked the occasion by sending the following telegram to Lord Rothermere at the Air Ministry in the Strand :—

"To-day the Royal Air Force, of which you are the Minister in charge, comes into existence as a third arm of the defences of the Empire. As General-in-Chief I congratulate you on its birth, and I trust that it may enjoy a vigorous and successful life.

"I am confident that the union of the Royal Naval Air Service and the Royal Flying Corps will preserve and foster that *esprit de corps* which these two separate forces have created by their splendid deeds.

"George R.I."

Lord Rothmere replied as follows :—

"Lord Rothermere, with his humble duty to your Majesty, begs leave on behalf of the Royal Air Force to convey an expression of their heartfelt appreciation of the gracious message addressed to them by their General-in-Chief.

"Lord Rothermere is confident that the assurance of your Majesty's interest and confidence will assist every officer and man in the Royal Air Force in the task of continuing the great traditions of the Royal Naval Air Service and the Royal Flying Corps—traditions which, as your Majesty has personally seen, have never been more gloriously maintained than in the struggle now proceeding."

THE KING AT THE FRONT.

The correspondent of the "Times," writing of the King's visit to France on March 28th-30th, says :—

Calls were made at the headquarters of the Royal Flying Corps and at several aerodromes. At one of these were men of Captain McCudden's squadron—Captain McCudden was not present—and the King was able to give them the first news of the bestowal of the Victoria Cross on their champion. The news was received with vociferous cheering.

UNIFORM FOR THE ROYAL AIR FORCE.

Air Force Memorandum No. 2.

1. The uniform for Officers, Warrant Officers, N.C.Os. and men of the Air Force has now been approved. Khaki will be worn as Service Dress for the period of the war, after which uniform of the same pattern, but of light blue cloth, will be substituted as early as possible.

The blue uniform may be worn by Officers during the war as Mess Kit. This is purely optional.

Uniform in khaki and blue may be seen in Room 751, 3rd Floor, North Block, Cecil Chambers, Air Ministry.

The new uniform will not be made compulsory until sufficient time has elapsed for existing uniforms of the R.N.A.S. and R.F.C. to be worn out, unless an allowance is made to Officers, when they will be expected to get khaki uniform as soon as possible. Further instructions on the latter point will be issued later.

Khaki Service Dress during the War.

Officers.

2. Cap and Cap Badge. The cap is the same pattern as that worn by the R.N.A.S. The crown is khaki and the peak and band are black. The badge is entwined laurel leaves, above which is a reduced facsimile of the metal bird at present worn on the sleeve by the R.N.A.S., the whole being surmounted by a Crown.

Rank is denoted as follows :—

Sec. Lts. and Lts.—One upright metal bar on each side of the badge.

Captains.—Two upright metal bars on each side.

Field Officers.—One row of gold oak leaves on the peak.

General Officers.—Two rows of gold oak leaves on the peak.

3. Jacket. The pattern is that of the Military tunic Service Dress modified as follows :—

(*a*) No shoulder straps.

(*b*) In lieu of Sam Browne belt a cloth belt is sewn on the back of the coat, which fastens in front with a bright buckle of gilt metal.

(*c*) The buttons are the R.N.A.S. type, *i.e.*, gilt metal with Bird surmounted by Crown.

Officers transferring from the R.N.A.S. and the R.F.C. will on supplying themselves with the Air Force Uniform, wear Rank distinction corresponding to that which they hold in their present service whether their present rank is permanent or temporary.

4. Badges of Rank. *Distinction Lace.* The badges of the Royal Navy in khaki braid will be used, with a Bird surmounted by a Crown, both in gilded metal, in lieu of the executive curl.

Rank is denoted as follows :—

Sec. Lt.—No lace, but Bird and Crown on both sleeves where lace would otherwise be.

Lt.—One row of distinction lace surmounted by Bird and Crown.

Capt.—Two rows of distinction lace surmounted by Bird and Crown.

Maj.—Two-and-half rows of distinction lace surmounted by Bird and Crown.

Lt.-Col.—Three rows of distinction lace surmounted by Bird and Crown.

Col.—Four rows of distinction lace surmounted by Bird and Crown.

Brig.-Gen.—One broad row of 2¼ in. lace surmounted by Bird and Crown.

Maj.-Gen.—One broad row and one ordinary row of distinction lace surmounted by Bird and Crown.

Lieut.-Gen.—One broad and two ordinary rows of distinction lace surmounted by Bird and Crown.

General.—One broad row and three ordinary rows of distinction lace surmounted by Bird and Crown.

5. Trousers and Breeches. As now worn by the R.F.C.

6. Shirts and Collars. Khaki shirts and collars with black ties.

7. Footgear.

With breeches—brown field boots or brown boots with puttees or gaiters, or brown stockings with shoes for aerodrome and similar wear.

With trousers—brown boots or shoes with brown socks.

8. Greatcoat. The usual military type British warm for mounted services. Badges of rank will be indicated on the shoulder strap in the same way as on the jacket, by distinction lace surmounted by Bird and Crown.

9. Distinguishing Marks. *For Pilots.*—The "Wings" of the R.F.C. on the left breast, with the substitution of the letters "R.A.F." for "R.F.C."

For Observers.—The "Half-Wing" with the letter "O" as at present worn by observers in the R.F.C.

For Medical Officers.—The badge of Caduceus of Mercury on the lapels of the Jacket. The Cap will be the ordinary cap of the Air Force Officer.

10. Blue Uniform used as Mess Kit.—The blue uniform is the same pattern as the khaki uniform, except that gold braid is worn instead of khaki braid.

White shirts and collars and black ties will be worn, and black boots or shoes.

Warrant Officers 1st Class.

11. Cap and Cap Badge. *The Cap and Cap Badge* will be the same as for Officers but with no bars on each side of the badge.

Uniform (including greatcoat) will be of the same pattern as for Officers, but the cloth will be of the texture issued by the R.A.C.D.

Rank will be denoted by a Bird surmounted by a Crown, both in gilt metal, and worn on both sleeves close to the shoulder.

Warrant Officers 2nd Class, N.C.Os. and Men.

12. Cap and Badge. The same pattern as at present issued to Petty Officers in the R.N. but with khaki Crown and black peak A Bird is substituted for the Anchor on the R.N. badge. Warrant Officers 2nd Class and N.C.Os. will wear a gold embroidered badge, and men a worsted embroidered badge.

13. Jacket. The same pattern as Officers except as follows:—
High all round collar.
Buttons of bronze colour instead of gilt.

Warrant Officers 2nd Class, N.C.Os. and Men will wear the Bird in red silk on both sleeves near the shoulders where the letters R.F.C. are worn at present by the rank and file of the R.F.C. Wireless Mechanics will wear, in addition, the "Hand and Thunderbolt" immediately under the Bird.

14. Badges of Rank. *Warrant Officers 2nd Class* (Quartermaster Sergeants). Crown on both sleeves below the elbow.

Flight Sergeants. 3 Chevrons and Crown.

Corporals and Sergeants. 2 and 3 Chevrons respectively.

1st Class Air Mechanics. 2 bladed propellers worn immediately under the Bird.

15. Footgear. Brown boots will be worn.

16. Leave and Parade Dress. Breeches, puttees and boots. Trousers will be worn as ordered.

17. Greatcoat. The usual military type British warm for mounted services.—The red silk Bird and badges of rank will be worn as on the jacket.

R.A.F. APPOINTMENTS, TRANSFERS, AND ATTACHMENTS.

Enquiries have reached this office recently respecting the position of men who joined the R.F.C. for "three years or the duration of the war," and who are now transferred to the R.A.F. for a period of four years. One enquirer asks what would happen to the "three years" men if the war stopped within the next six months or so, and wants to know whether they would have to serve the full four years in the R.A.F. on top of the two or three years already served in the R.F.C.

Apparently the official wording of Air Force Memorandum No. 1 is a trifle obscure in that this particular point is not specifically discussed. However, R.A.F. Headquarters kindly permit one to state, for the benefit of such anxious persons, that the Air Force takes over all existing contracts of this nature as they stand. That is to say, a "three years'" man is free to leave the Air Force whenever the Army is officially disbanded after the war.

There is no official pronouncement as to how long after the end of the war such disbandment will take place, but one can safely say that it will not be permissible for every air mechanic to "down tools" immediately peace is declared. A "state of war" will undoubtedly exist in theory for some time afterwards. Obviously the whole Navy, Army, and Air Force could not be let loose all at once to flood the country with their unemployed millions of men. Imagine what the Amalgamated Society of Engineers, for example, would have to say about such spoiling of the labour market. Disbandment must naturally take place gradually, and, one hopes, under conditions so organised that every man will walk out of the King's Service into respectable civilian employment.

In any case there is no cause for the "three years'" men to worry about the four years in the Air Force. They need have little fear of the war being over before they have completed both terms of service. But they may rest assured that if by any chance it does finish within the next four years they will be permitted to leave the Air Force just as soon as if they had remained in the Army.

Another species of enquiry comes from several youngsters who have been accepted as Probationary Flight Officers, R.N., and have not yet been ordered to report for duty. They appear to be anxious to know whether, when ordered to join the R.A.F., they will join as P.F.Os. at 14s. a day, or as R.A.F. Cadets at 1s. 6d. a day.

One gathers that those who have not already joined as P.F.Os. will now join as Cadets. The difference is slight. Instead of having to keep themselves out of 14s. a day, they will be housed, fed, and clothed, and will have 1s. 6d. a day for pocket money; which is probably quite as much as is good for them. If they prove suitable to hold the King's Commission they will be made commissioned officers. If not they may become N.C.O. pilots. If unsuitable as pilots they may become technical officers, or air mechanics, or they may be handed over to the Army. In any case they have no cause for complaint, for their future depends entirely on their own ability, and they may consider themselves very fortunate in having the opportunity of joining the Air Force.

Among those who have what looks like genuine cause for complaint are a number of Flight-Lieutenants R.N., some with two years' service or more, who come into the R.A.F. as lieutenants, though hitherto they have ranked with a captain in the Army. They make no complaint against the Army on account of their demotion, but that to which they do object is the taking in of all R.N.V.R. lieutenants as captains in the R.A.F.

It certainly seems hard that active service officers who have done good work, and who have not been promoted simply because the R.N.A.S. has not grown so quickly as the R.F.C., should come into the R.A.F. on a level with the latest confirmed P.F.O. or cadet, while R.N.V.R. two-stripers who have never even been to see the war walk in as full-blown captains, let alone the equally unwarlike two and a half stripers who blossom forth with brass hats as majors.

A curious omission from the Memorandum is any reference to R.N.V.R. sub-lieutenants. There are, one believes, a certain number of R.N.V.R. sub-lieuts. who joined and served as observers before the rank of observer-sub-lieut. was instituted. Those who continued as observers were, one believes, given the new rank, but there are others who, owing to wounds, injury, or illness contracted on active service, had to give up flying and have been employed on technical work of very considerable importance. Being merely R.N.V.R. Air Station officers, or abroad on active service, and not employed in London offices, some of them have probably been overlooked.

In the ordinary way one would expect such officers to come into the R.A.F. with some recognition of their past services and present responsibilities, but doubtless amid the scramble for recognition around Headquarters it was hard to see these quiet and distant servants of the King. Perhaps this note may recall their existence to those who have the handing out of promotions in the new force.—C. G. G.

THE ROYAL AIR FORCE.

(A Flying Officer's View.)

In one of the daily papers I have noticed an article on the new Royal Air Force, hoping that all officers will, as soon as possible, adopt the new uniform, and so put an end to any supposed friction that there may have been formerly between the two Services.

May I point out, from personal knowledge of many pilots and observers (and, after all, they are the only members of the Services, who, from a military point of view, are of value), that far more bad feeling is caused by the new letters R.A.F., than was ever present between the R.F.C. and R.N.A.S. as rivals.

In the words of a certain gentleman, the honour, glory, and prestige that both Services have gained in the past are to be merged into the letters R.A.F., letters which unfortunately, stand for all that has been bad and hampering to Military Aeronautics.

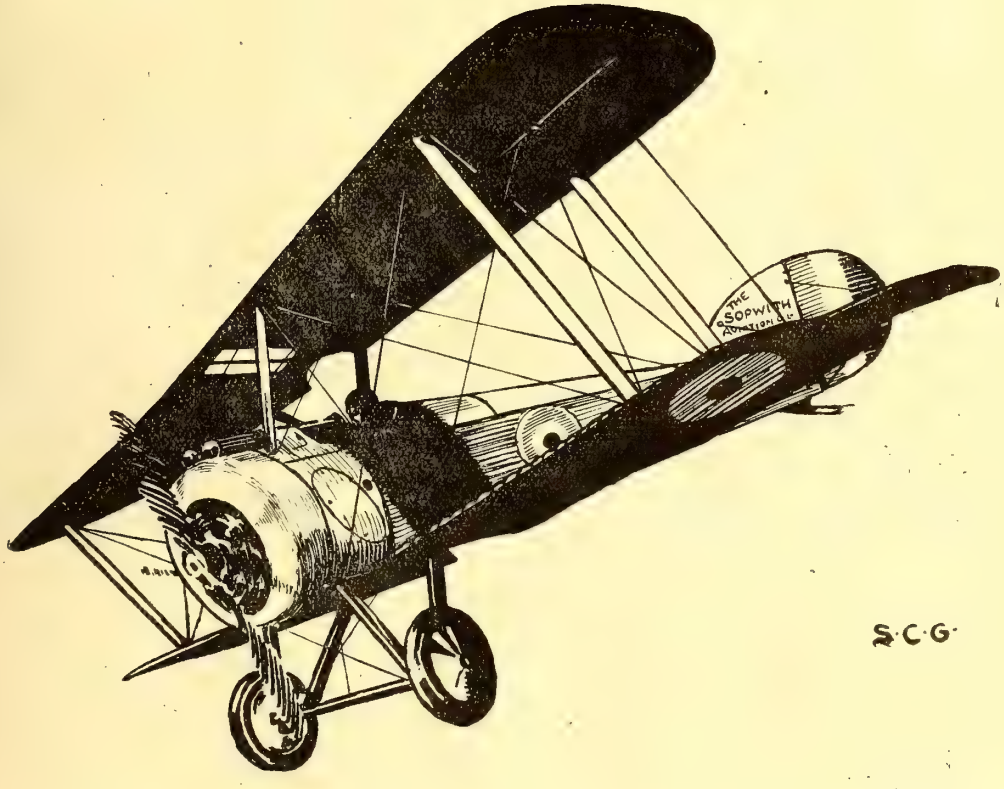
This choice may possibly have pleased certain technical, and, consequently, non-flying officers of the former R.F.C., but it cannot be regarded as anything less than a direct insult to all pilots, observers, and active fighting members of both Services, who, in the past, by their courage and devotion to duty, hampered as they were by inefficient and obsolete R.A.F. products, yet managed to maintain the prestige of the Flying Arm.

It is more than unfortunate that the amalgamation of the Services should have been carried out under this heading. A choice which, for lack of tact and understanding, could hardly have been exceeded, and which cannot fail to cause grave irritation.

Needless to say, few pilots or observers are going to stamp themselves voluntarily as R.A.F. products by adopting the new uniform until compelled to do so.

[One sympathises entirely with this officer's feelings, but the order has gone forth. The Brand of Cain, in the form of the letters R.A.F., cannot now be avoided. One can only advise officers and men of the R.A.F. to bear their brand in a proper Christian spirit, and to do their best to earn for the letters R.A.F., the same honour and respect which the R.F.C. badge has won.

The brand is perhaps a useful antidote to the fulsome flattery which has been oozing from all the pores of the officially inspired Press during the past week, in its endeavour to persuade the world that the R.N.A.S. and R.F.C. should be proud to sink their dearly bought honours in the common puddle which the name of the R.A.F. suggests.



About the only person who can be congratulated on the new name is Lieut.-General Sir David Henderson, K.C.B., D.S.O., for it was due to his misplaced faith in the "experts" of the Royal Aircraft Factory that the R.A.F. products were allowed to hold back the output of improved designs and to waste labour and material which could have produced more and better aeroplanes for the R.F.C. He has now the pleasure of seeing the whole of our Flying Services branded with the name which stands for all that has been bad in Service Aeronautics. One hopes that he is satisfied.—C. G. G.]

"A PROTEST."

There are plenty of jobs in a pilot's life,
For his work is varied and never stale.
He guides the shells through the grumbling strife,
And follows the strafe in the gun-made gale.
On art-obs he streaks through the shell-swept lane,
Like a driven bird past the Ack! Ack! guns,
Until he wins to his own again
Breaking the cordon of gaudy Huns.
He is wakened again at any old hour
When the flares are lit neath the starry sky,
To worry and work to the best of his power
And in all he works, that the Hun may die.
But yet there are folk, who strike for more pay,
Or sit idle at home, not heeding the blood
That a gallant man will shed one day,
When some pilot fails in a "bus that is dud."

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

THE AIR COUNCIL AND ITS FUNCTIONS.

(Continued.)

BY HENRY FORESTER.

The Advisory Committee.

The Advisory Committee on Aeronautics which for some years has occupied happily a nebulous position in the aeronautical world, recording with commendable fidelity the thought that had passed with "the snows of yester year," is to report to the Director-General of Aircraft Production, who will in turn either make use of such information as is available, or will communicate the views of the Committee to his colleagues on the Air Council.

The Air Inventions Committee, which in many ways has the duties of a permanent Commission on Lunacy, will also continue its sedative work under the direction and inspiration of the same Director-General. This Committee is somewhat confused in form, as it is a sub-committee of the Advisory Committee, and at the same time acts as a link between the Board of Inventions and Research and the Munitions Inventions Department. At least, so I read the not very clear definition given by Major Baird.

Land and Works.

The Administrator of Works and Buildings, who would appear to exist—from the appointments made to the Air Council in January—undertakes part of the duties in the maintenance and construction of Air Force buildings which would otherwise be done by the Controller-General of Equipment, and which in the Army is undertaken by the Master-General of the Ordnance.

Land in the case of the Army is under the charge of one of the civil branches of the Army Council. The Parliamentary Under Secretary of State for War has under him a Comptroller of Lands, who commandeers, buys, or hires such land as is required for the use of the King's Service.

In the Air Force these duties, which seem to be but little when stated in print, will be the province of a special Director of Lands. But with the Royal Air Force an infinitely greater extent of land must be taken over than is the case either in the Army or the Navy. The land on which barracks, stores, training depots, and so forth are erected will be much the same in total area, but in addition to all that there are the vast spaces that are required for aerodromes and landing grounds in all parts of the Empire.

The Under Secretary.

The Parliamentary Under Secretary for the Air Ministry undertakes the duty of representing the Ministry in the House of Commons when the President happens to be a Peer of the Realm. At all times, whether his chief is in the same House or not, he is put up to answer those insistent questions, on such matters as church-going in the R.A.F. or the contract price of castor-oil, which exasperate continually all Under Secretaries of State.

Departmentally he undertakes the control of the non-effective votes as once did the Under Secretary of State for War. Like him, also, it is possible that, should a Territorial Air Force come into existence at a later date, it will be under the direction of the Parliamentary Under Secretary of State for the Air Ministry.

Financial Duties.

But he also does similar duties to the Financial Secretary of the War Office. The Annual Estimates are drafted by him after consultation with the rest of the Air Council. Each item must be considered in its relation to the rest. No branch should be permitted to score at the expense of another branch momentarily less in the public eye.

He regulates the finances of the Air Force. All new proposals involving expenditure must be submitted to his department for approval. Similarly the creation of new appointments, new staff appointments, increased establishments, all pass through his hands.

The auditors of the Royal Air Force are under his direction, and he is technically responsible to Parliament for the proper expenditure of the money voted. The Pay Department is under him for administration.

Additional Members.

There are two additional members of the Air Council who can be appointed apparently without specific duties. One of them at the present time is Vice-President of the Council, and as the holder of the appointment is a soldier of long experience it is not unlikely that he will frequently preside over the Council in the discussion of military plans.

No specific duties are laid down for him in so far as can be judged from public statements, and it is not unlikely that he is unhampered by departmental duties deliberately in order that he may advise and assist wherever necessary.

The other additional membership of the Air Council is now held by a former editor of the "World's Work," which periodically described the manner in which other people worked, with pictorial representations of the workers. Perhaps this gentleman is appointed to the Air Council in order that he may in real life watch other people work and report on the manner in which he considers they do their duty.

The Secretary of the Air Council, unlike his prototype of the Navy, has no seat on the Council, and therefore it is unnecessary to describe his duties further than to say that he is responsible for the maintenance of the departmental personnel and that the central registry is under his direction.

Exact Allocation of Duties.

The exact allocation of duties to each member of the Air Council cannot be formulated with accuracy even by prescient members of the War Cabinet. Paper schemes can be produced by the dozen, each with more inherent charm than the last, but experience alone can define the exact boundaries of the work to be performed by each of those who form the Air Council.

No service can be conducted in water-tight compartments, and it is not possible to avoid considerable overlapping. If, however, there is general agreement as to policy, overlapping is an advantage rather than a drawback.

Dreams Which Go by Contraries.

From such declarations as have been made in public by responsible Ministers and from the Terms of an Army Order published towards the end of the past week it would appear that the Air Council can neither initiate nor conduct operations in the field nor on the high seas. Many of those who are responsible for the political agitation which has produced the Royal Air Services had visions of raids on an enormous scale carried out with brilliancy and efficiency over enemy lands under the direction of a vigorous President of the Air Council.

Their visions have so far followed those principles of the dream-book which ordain that when one dreams of a coffin one's immediate future is to be a revel of unrestrained joy. The War Cabinet have apparently decided that in the present infantile state of aeronautics it is as well that the existing land and sea forces should

MARTINSYDE

BROOKLANDS.

Head Office & Works:
WOKING, Surrey.

direct all aerial operations in addition to their historic duties. In essence the Air Council is for the time being an administrative body whose main responsibility is the assisting of the Army and the Navy in the prosecution of the war.

Doubtful Cases.

There are many cases arising from time to time in which it is not clear whether certain aerial operations concern more closely the Navy or the Army. It is, for instance, necessary to bomb the Belgian coast and to patrol its shores day by day to check the activities of enemy aviators. Which Service is more closely affected by such work? The Navy may claim priority in that all shores border on seas and all seas belong to the British Navy since the days when Sir Francis Drake and Sir John Hawkins legalised piracy.

The Army, on the other hand, can insist equally that the shore is the border of the land, and that enemy squadrons flying in such places are more perilous to the forces in the field than to ships at sea. Each in truth have good reasons on its side.

To settle such questions and to delimit the respective spheres of operations there are weekly meetings between the Staff of the Air Force, the Staff of the Navy, and the General Staff of the Army. Cardinal disagreements at such meetings will no doubt be submitted to the War Cabinet for decision.

Recommendations of Operations.

The Air Council very properly has been given the power to recommend certain aerial operations, such as, for instance, the elimination of Essen by aerial bombardment, and can suggest to the War Cabinet which Service should conduct the entire movement. When once approval has been given, the Air Council must supply, equip, and maintain a contingent of proper size for the work to be undertaken. The Army and the Navy are relieved of all duties in regard to the Air Force, save the employment of Air Force units in the field.

The New Army Order.

The following Army Order was published on March 29th, and lays down the channels of communication and the relation between the Army and the Air Force :—

(I.) The Air Council has, as already notified, taken over the administration of all technical Air material, and all movements and postings of individuals of the Air Services.

(II.) It has now been decided that the Royal Air Force is to be brought into being as a unified force as from April 1st, 1918, from which date its administration will be vested in the Air Council.

(III.) From that date the procedure as between the Army and the Air Council, and between military commanders and Royal Air Force commanders as regards the allocation and command of bodies of the Royal Air Force, and as regards correspondence, will be as follows :—

(i.) The Army Council will indicate to the Air Council the number of squadrons of the various classes required for all military commands at home and abroad; where necessary they will inform the Air Council of any increases or decreases which they consider should be made.

(ii.) The Air Council will organise and equip these forces and hand them over as complete organisations to the military commanders. They will maintain them in personnel and equipment. Should the Air Council not be in a position to supply the complete requirements, to effect increases demanded, or to maintain air forces already provided, it will be for the Army Council to decide whether the deficiency can be met at the expense of contingents of the Royal Air Force operating under military commanders in other theatres.

(iii.) Serious deficiencies in personnel or equipment of Royal Air Force contingents, which are such as to affect materially the efficiency of the military force concerned, will be brought to the notice of the military commander by the Royal Air Force commander and communicated by the former to the Army Council.

(iv.) The military commander, who has under his orders a contingent of the Royal Air Force, will have the power to remove the commander of that contingent should he consider such action necessary, and may appoint temporarily a Royal Air Force officer to command from those available locally. The permanent replacement of the officer removed will be carried out by the Air Council after consultation with the Army Council.

(v.) Removal or transfer of subordinate Royal Air Force officers belonging to contingents under military commands will normally be carried out, without consultation with the Army Council, by the Air Council, who will issue their instructions direct to the local Royal Air Force commander.

Should the military commander be dissatisfied with a subordinate Royal Air Force officer acting under his orders, he will have power to direct the local Royal Air Force commander to suspend the subordinate officer of the Royal Air Force pending reference to the Air Council. In such cases the Air Council will consult the Army Council as to the action to be taken.

(vi.) Important alterations in the establishment or equipment of Air Force units allotted to military commanders, such as will affect the mobility or efficiency of the military force as a whole, will not be carried out without the concurrence of the Army Council.

(vii.) Alterations of approved establishment, suggested by the Royal Air Force commander for the improvement of the contingent under his command, will be submitted through the military commander concerned and by the latter to the Army Council.

(viii.) Recommendations for improved methods of co-operation or training with other arms will be submitted by military commanders to the Army Council, who will forward them with their recommendation to the Air Council.

(ix.) In general, communications on air subjects from military commanders, whether initiated by, or forwarded at the request of, Royal Air Force officers, or not, will continue to be addressed to the Army Council. The Army Council will inform the Air Council of the contents of these communications as may be necessary.

(x.) Reports and recommendations dealing with the technical training or equipment of Royal Air Force units will be submitted by Royal Air Force commanders direct to the Air Council, and instructions on these subjects will be issued by the Air Council direct to the Royal Air Force commander concerned.

(xi.) Reports on air operations of the Royal Air Force contingents allotted to military commanders will be forwarded by the Royal Air Force commander simultaneously to the military commander concerned and to the Chief of the Air Staff, Air Council.

Absolute Control.

The Army Order is self-explanatory. The Army Council is still in a position of absolute predominance in so far as concerns the employment of Royal Air Force units for military purposes.

Save in the matter of "Reports and recommendations dealing with the technical training or equipment of Royal Air Force units," which will be submitted direct to the Air Council, all communications pass to the Army Council for necessary action. The Army Council, of course, are expected to keep the Air Council informed not only of all that has happened, but of the methods intended to be used in future.

The terms of this Army Order remove the main cause of uneasiness from the minds of experienced soldiers. It was feared that the formation of the Air Council in the middle of the greatest war in history might, if that body had too much power, tend to disunion in operations, however unintentionally such divergence of effect might come about. It is now clear, however, that the military commander in the field is to remain supreme, and that in so far as the Army is concerned the aerial contingents will remain to all intents and purposes an arm of that Service.

District Commands.

If Royal Air Force districts were to be formed in England, the question arises whether they should be distinct from the great Army Commands or whether they should be territorially the same and should exist merely for the purpose of administering the Royal Air Force units stationed in the commands, these units being for operations and training under the respective military commanders concerned. The latter course would be simple and effective, and would ensure similarity of practice at home and abroad, in peace or in war. One can reasonably assume this to be the correct reading of paras. (i.) and (ii.) of the A.O.

Thus in the Scottish, Northern, Western, Southern, and Eastern Commands and London district and in Ireland there would be a Royal Air Force General Officer Commanding the R.A.F. units in the command. He and his contingent would be under the G.O.C. each Command

for operations and training, and he would administer the contingent himself, with responsibility in this matter only to the Air Council, provided the necessary standard of efficiency were maintained.

Abroad in times of peace it is only natural to assume that a similar practice would obtain overseas in each of the great Commands and garrisons holding the uttermost posts of the Empire.

It is to be assumed that a similar order will be issued by the Lords Commissioners of the Admiralty in regard to the Air Force units selected for service with the Fleet and at Naval Stations.

ULTIMATE INDEPENDENCE.

At a later date, when the strategy and tactics of the air have developed to such a degree that they stand in such relationship to combat on land and sea as sea warfare does at present to land warfare, it may be that the Air Council will both initiate and direct campaigns in the air. It is hard for those of us who have been trained in conservative schools of thought to realise that an aerial force will ever operate independently in every way from the Army and the Navy.

It is possible to-day for the Army to carry through a campaign in which the Navy has no concern. Equally it is possible for the Navy to operate without aid from the Army. In the future it is said that the Third Service also may have a war entirely to itself without interference from the older Services.

When that time comes, the Air Council, if it still exists in even a shadow of its present form, will be able to justify its existence and take over from the Admiralty and War Office part of the great burden they have borne so long and so well. The Air Council has great opportunities, and it is fortunate in the possession of some officers endowed with military genius and inspired with enthusiasm in the work they have chosen.

At present the Air Council appears to fulfil merely functions somewhat similar to those pertaining to the Board of Ordnance prior to its reform in the middle of the nineteenth century.

THE "GOEBEN" AFFAIR.

The officially approved account of the "Goeben" affair is about the most painful reading to which anyone with any respect for the King's Navy could be subjected. The ship was, it seems, attacked from Jan. 20th to Jan. 29th inclusive. The number of flights made in attacking her was 276. The weight of bombs dropped was 15 tons 3 cwt. As the result of all that fuss, 16 direct hits are claimed on a big ship which was hard and fast aground. After which it seems that she went home from the Dardanelles to Constantinople under her own power. Such an amazing confession of incompetence on the part of the Admiralty has probably never been made public since that unfortunate and gallant officer, Admiral Byng, was shot on his own quarter-deck for failing to do the impossible, because of the Admiralty's sins of omission.

One is full of admiration for the gallant young aviators who made those 276 flights by day and by night, but what is one to think of the High Command which made such and so many flights necessary? As one pointed out at the time, one torpedo-carrying seaplane would have settled the "Goeben" for ever.

It is getting on for five years since Captain Sueter, R.N., began experiments with torpedoes from seaplanes at Ca
It is three years since one of our torpedo seaplanes sank a Turkish transport in the Marmora. It is over a year since a German torpedo seaplane attacked shipping in British waters. Yet here we have official evidence that when the chance came of sinking the one dangerous ship in the Eastern Mediterranean, the R.N.A.S. was not equipped to deal with it. Who is responsible for the omission, and who is to blame for these 276 unnecessary flights with their consequent waste of bombs and petrol, and wear and tear of men and machines? And will the culprit suffer in any way?

THE OFFICIAL ACCOUNT.

However, let the official account speak for itself and for the organisation of the R.N.A.S. :—

Details now available of the air operations carried out at the Dardanelles against the "Goeben" and "Breslau" show that as soon as news that the vessels were out had been received early on January 20th our air patrols were despatched. Twenty minutes later a message was received that Kusu and Kephalo were being shelled, and all the Greek pilots at an adjoining air station at once flew over to take part in the air operations. With the first clear light it was seen that H.M.S. "Raglan" had sunk at anchor and that monitor 28 was on fire amidships.

The "Goeben" and "Breslau" were then about five miles out to sea off Kusu and steering south. They were followed by our planes. Ten minutes later eight to ten machines were continuously harrying the enemy ships. This action of our aircraft was causing the "Breslau" to steer a zigzag course, which brought her into one of our minefields, where she struck a mine. Very shortly afterwards she was hit by an aircraft bomb and sank. Five Turkish destroyers endeavoured to reach the spot, but were driven off by two British destroyers.

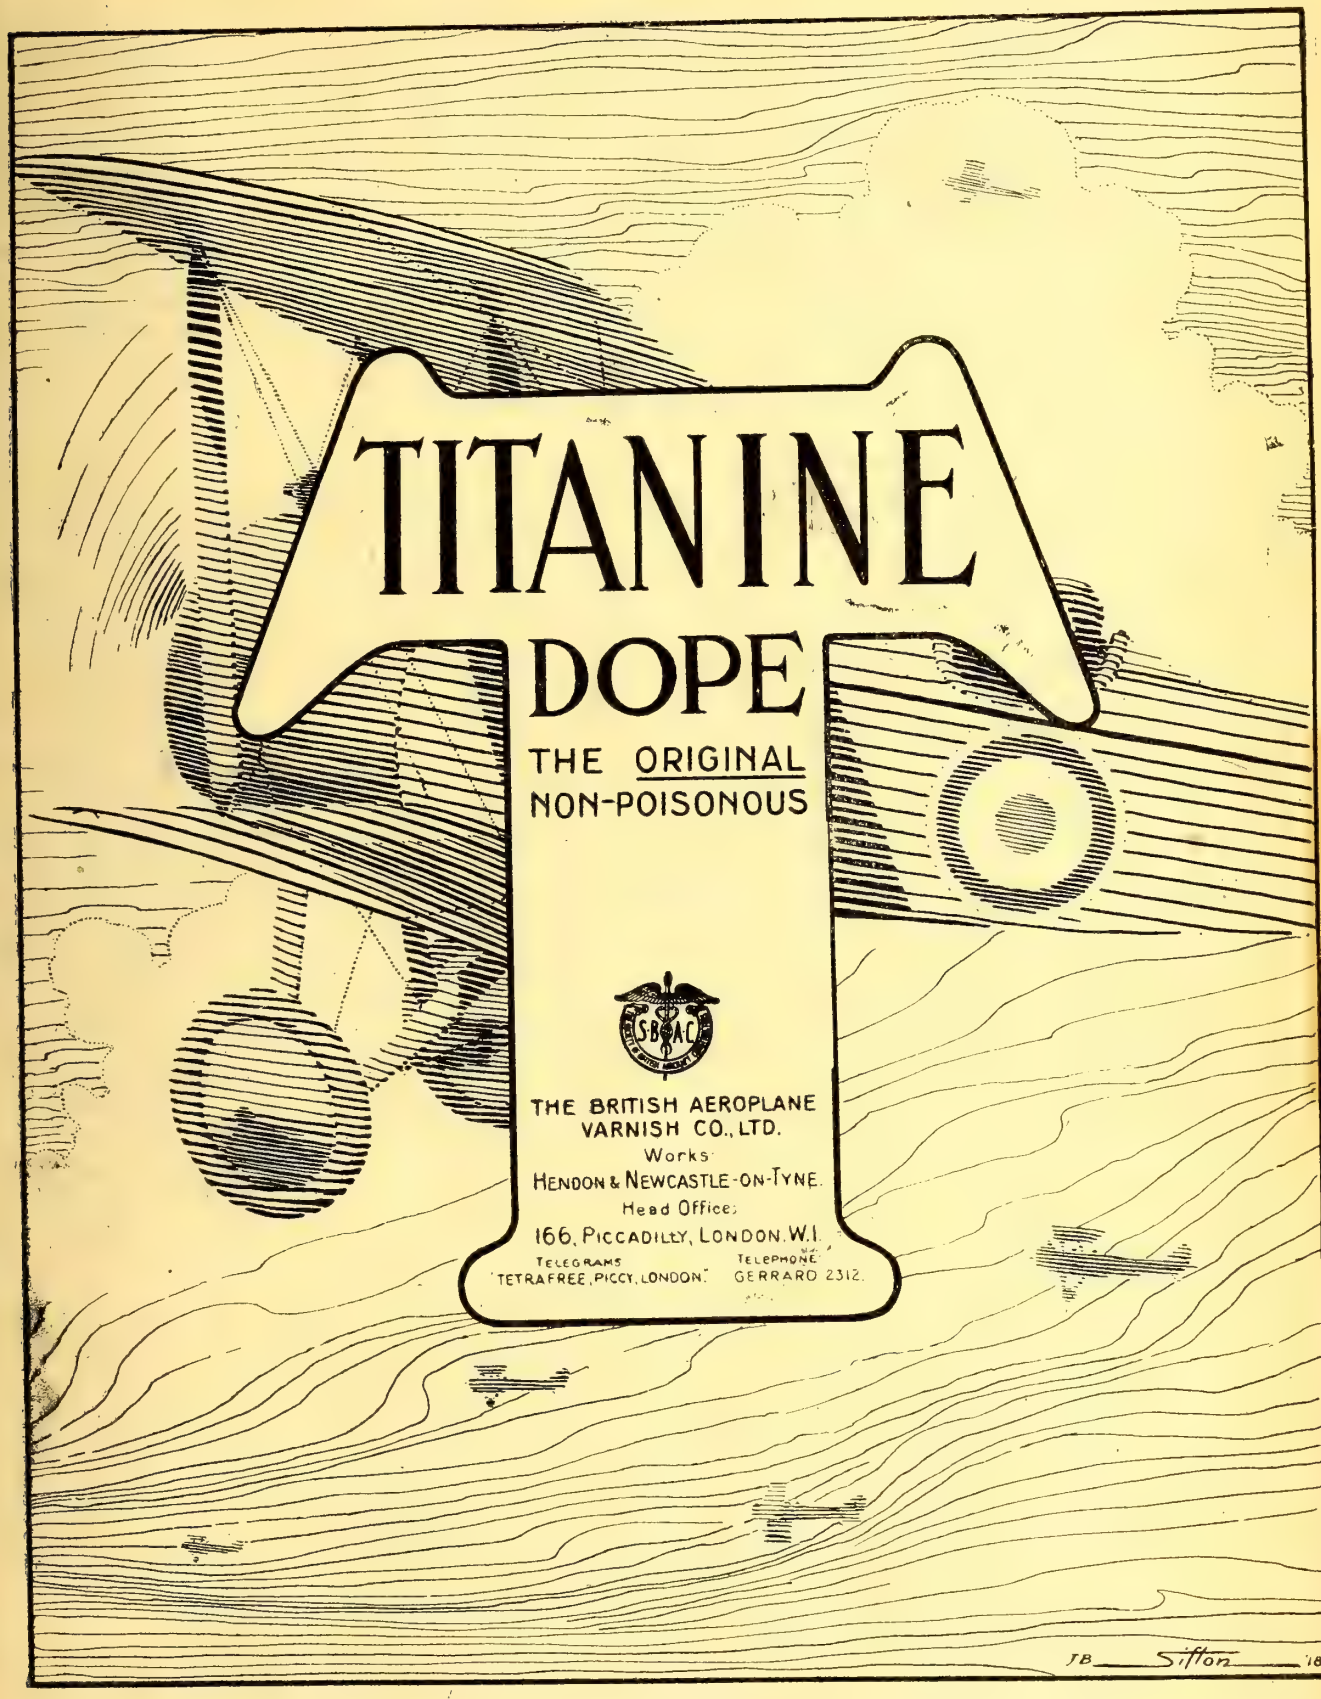
Heading for the Dardanelles the "Goeben" struck one of our mines, and developed a list to port. Aircraft continued to bomb her while she entered the straits, and she ran aground at Nagara Burnu. Pilots who undertook a special reconnaissance reported that she looked as though aground, as she was slightly tilted up forward and a large amount of disturbed mud was seen around her. Sixty-five flights were made during the day, and a great many pilots and observers made two or three attacks on the enemy's ships.

At dawn on the following day a raid was made on the "Goeben" by five bombers. It began in semi-darkness and the Narrows were obscured by clouds, so that the ten heavy bombs were dropped during anti-aircraft fire in the estimated position of the "Goeben" and no observation could be made. At midday a bombing raid commenced in which fourteen machines took part, going up at intervals of ten minutes.

Shortly after 6 p.m. on the 21st nine machines made a night raid. Continuous anti-aircraft fire was directed on them from shore batteries and from the "Goeben." Six heavy bombs were dropped on the "Goeben" from heights of 2,500 ft. to 3,000 ft. While no claim to a direct hit can be made, one explosion took place in close proximity to the two searchlights of the "Goeben," which seemed to be the reason for their immediate extinction. All the machines returned safely. Fifty-one flights were made during the 24 hours, and two tons of bombs were dropped.

At 9 a.m. on the 22nd four machines made a successful raid. One made a direct hit amidships, and a volume of steam and smoke appeared directly afterwards from the ship. R.N.A.S. machines at 1.45 p. m. dropped eight bombs, which fell close to the "Goeben."

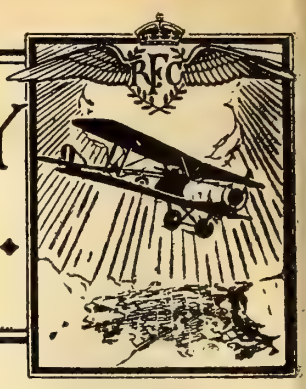
In a night raid three small seaplanes all dropped bombs on her. One of these pilots dropped his bombs on or near the ship from the height of 4,000 ft. On the return flight he landed midway between Lemnos and Imbros owing to engine trouble, and on his gliding to the surface six shots were fired at his machine, apparently by a submarine, when he was at a height of 600 ft. He was not molested, however, when on the water, and, although Vérey lights were fired from the seaplane and calcium flares dropped, he received no assistance during the night of the 22nd. At 5.30 a.m. on the 23rd a seaplane found and towed his machine to the mouth of Mudros Harbour, where she was brought in undamaged by a destroyer.



At midnight on the 22nd four direct hits were registered on the "Goeben," and from 8 a.m. that day to 8 p.m. on the 23rd 48 flights were made, bombs weighing 56½ cwt. being dropped. Forty-six flights were carried out in the next 24 hours, and 72 cwt. of bombs were dropped on the "Goeben," ships and boats round her, and on the Galata aerodrome. During the following 24 hours the flights numbered 34, and the bombs dropped weighed three tons.

Raids were continued until the 27th, but on January 28th seaplanes reported that the "Goeben" had disappeared, and that there was no wreckage floating around the spot where she had been. A reconnaissance of the Constantinople area to locate her was made on January 29th. The "Goeben" was seen lying near the inner of the two bridges spanning the Golden Horn by the arsenal, and stretching half-way along that bridge. The largest of the arsenal dry docks was seen to be flooded and open, and the smaller dry dock contained a ship which could not be identified.

During the attack, which lasted from January 20th to January 29th, 276 flights were made by our aircraft, and approximately 15 tons 3 cwt. of bombs were dropped, while at least 16 direct hits on the "Goeben" were recorded.



THE GENTLE TURK.

In a letter just received from Mesopotamia a Guildford man serving with the Queen's Royal West Surrey Regt., writes: "At the funeral of General Sir Stanley Maude a Turkish airman flew over the cortège and dropped a wreath 500 yards in front of the column. The machine then dipped twice, about-turned, and flew back to its nest. During the time it was over the city, and before its mission could be divined the machine was subjected to anti-aircraft fire, but fortunately it evaded the shells."

Lt. D. A. M. MacManus, R. Innis. Fus., to be temp. Capt. (without the pay or allowances of that rank), whilst acting as Adjt., vice Temp. Sec. Lt. (temp. Capt.) H. Waddington, Manch. R., who relinquishes his temp. rank, Feb. 20th.

* * *

The King has been pleased to confer the following rewards for gallantry and distinguished service in the field. The acts of gallantry for which the decorations have been awarded will be announced in the "London Gazette" as early as practicable:—

Distinguished Service Order.

Lt. (temp. Capt.) G. H. Bowman, M.C., R. War. R., Spec. Res. and R.F.C.
Capt. R. M. Drummond, M.C., R.F.C.

A Bar to the Military Cross

Capt. W. E. Molesworth, M.C., R. Muns. Fus., and R.F.C., M.C. gazetted Sept. 26th, 1917.
Temp. Capt. F. G. Saunders, M.C., R.F.C., M.C gazetted June 4th, 1917.
Lt. R. M. Smith, M.C., Aus. Light Horse R., attd. Aus. F.C., M.C. gazetted May 11th, 1917.

The Military Cross.

Temp. Lt. R. A. George, Gen. List and R.F.C.
Temp. Lt. G. E. Gibbs, R.F.C.
Temp. Capt. T. Gran, Gen. List and R.F.C.
Temp. Sec. Lt. R. W. Hobbs, S. Wales Bords., attd. R.F.C.
Sec. Lt. J. S. Jones, R.G.A., Spec. Res., attd. R.F.C.
Temp. Capt. R. K. Kirkman, Gen. List and R.F.C.
Lt. R. S. Larkin, R.F.C., Spec. Res.
Sec. Lt. (temp. Capt.) K. M. St. C. G. Leask, Devon R. and R.F.C.
Sec. Lt. G. E. H. McElroy, R.G.A. and R.F.C.
Temp. Capt. F. Nuttall, R.F.C.
Sec. Lt. T. L. Steele, Gen. List and R.F.C.
Temp. Capt. J. H. Tudhope, Gen. List and R.F.C.
Temp. Sec. Lt. A. B. Whiteside, Gen. List and R.F.C.
Temp. Capt. H. T. O. Windsor, Gen. List and R.F.C.
Capt. R. N. Wolton, R.F.A. and R.F.C.
Temp. Sec. Lt. A. J. Wright, Gen. List and R.F.C.

War Office, March 27th.

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing.—Sqdn. Comdr.—Capt. T. F. Rutledge, M.C., Spec. Res., to revert from a Wing Comdr., to relinquish the rank of temp. Lt.-Col., and to be temp. Maj. while so empld. (March 8th, seny. from May 15th, 1916).

Flt. Comdrs.—From Flying Officers:—Capt. S. R. Penrose-Welsted, R. Ir. Regt. (Feb. 7th); Temp. Lt. W. H. Park, Gen. List, and to be temp. Capt. while so empld. (Feb. 26th); Capt. (Hon. Lt.) N. Deakin, Yeo., T.F. (March 2nd). And to be temp. Capts. while so empld.:—Temp. Sec. Lt. F. W. Wells, Gen. List. Temp. Sec. Lt. E. Waterlow, Gen. List. (March 8th).

War Office, March 28th.

REGULAR FORCES.—Staff.—Attached to Hd.-Qr. Units.—Brig. Comdr.—Bt.-Col. (temp. Maj.-Gen.) W. S. Brancker, R.A., and to retain his temp. rank whilst so empld., Oct. 19th, 1917.

Establishment.—R.F.C.—Mil. Wing.—Flt. Comdrs.—From Flying Officers, and to be temp. Capts. while so empld.:—Sec. Lt. (temp. Lt.) L. D. Baker, R. Dub. Fus., Spec. Res., Feb. 8th. Temp. Sec. Lt. M. M. McLeod, Gen. List, March 10th

Gen. List.—Temp. Lt. (temp. Capt.) C. A. Bourne resigns his commn., Sept. 15th, 1917.

Memoranda.—The following are granted temp. rank while empld. in the Aeronautical Supplies Directorate, Ministry of Munitions, Sept. 28th, 1917:—As Brig.-Gen.—Bt. Lt.-Col. W. Alexander, D.S.O., R. Highrs., T.F.

As Lt.-Col., Maj. I. B. Davson, Yeo., T.F.; temp. Maj. A. E. J. Reiss, Gen. List; temp. Capt. R. H. Brand, Gen. List; Capt. G. W. Williamson, M.C., Manch. R., Spec. Res.

As Capt.:—Sec. Lt. (temp. Lt.) C. L. Hardy, R.F.C., Spec. Res.; Lt. D. M. Greig, Suff. R.; Sec. Lt. (temp. Lt.) F. A. Woolfe, R.F.C., Spec. Res.; temp. Lt. F. J. Musselwhite, Gen. List; Sec. Lt. (temp. Lt.) H. L. U. Clark, R.F.C., Spec. Res.; temp. Lt. D. Munro, attd. High. L.I.; temp. Lt. G. H. Creighton, R.F.C., Gen. List; Sec. Lt. J. H. Cotton, R.F.C., Spec. Res.; Sec. Lt. (temp. Lt.) S. Blackley, R.F.C., Spec. Res.; Sec. Lt. H. F. L. Dixon, R.F.C., Spec. Res.; Sec. Lt. S. A. Marples, R.G.A., Spec. Res.; Sec. Lt. (temp. Lt.) F. W. Elstub, R.F.C., Spec. Res.; Sec. Lt. (temp. Lt.) G. Dennison, R.F.C., Spec. Res.; Sec. Lt. W. Park, R.F.C., Spec. Res.; Sec. Lt. R. Waddell, R.F.C., Spec. Res.; Sec. Lt. A. W. Gillespie, R.F.C., Spec. Res.; temp. Lt. J. M. Macauley, Gen. List; Lt. C. H. Johnson, R.E., T.F.; Sec. Lt. (temp. Lt.) A. Burgess, R.F.C., Spec. Res.; Sec. Lt. (temp. Lt.) W. Sillem, R.F.C., Spec. Res.; Sec. Lt. W. E. Nuttall, R.F.C., Spec. Res.; Sec. Lt. R. H. Sperling, T.F. Res.; Sec. Lt. E. H. Wilding, R.F.C., Spec. Res.; Sec. Lt. W. C. Clark; Sec. Lt. (temp. Lt.) L. G. Fenner, R.F.C., Spec. Res.; Sec. Lt. (temp. Lt.) L. Crooks, R.F.C., Spec. Res.; Sec. Lt. (temp. Lt.) H. B. Dresser, R.F.C., Spec. Res.; Lt. A. G. Griggs, R.F.C., Spec. Res.; temp. Lt. M. F. W. Sampson, Gen. List; Sec. Lt. S. V. Green, R.F.C., Spec. Res.; Sec. Lt. J. C. Murray, R.F.C., Spec. Res.

* * *

The King has been pleased to award the Distinguished Conduct Medal to the following for gallantry and distinguished service in the field:—

1753 Flt. Serjt. G. A. F. Gibson, R.F.C. (Queen's Park, London, W.).
2015 Serjt. F. Hopper, R.F.C. (Burnley).
7756 1st Cl. Air Mech. A. Leyland, R.F.C. (Burnley).

FROM THE COURT CIRCULAR.

Buckingham Palace, April 1st.

The Queen, accompanied by the Princess Mary and the Prince Henry, and attended by the Lady Katharine Coke and the Earl of Cromer, visited the Works of Messrs. Vickers, Limited, in the London area this morning.

Her Majesty was received on arrival by Sir Trevor Dawson (Director) and the officials of the Company.

Major C. S. Paulet (Ministry of Munitions) was also in attendance.

Pilot's Wonderful Escape Thanks to "TRIPLEX" SAFETY GLASS

Another Striking Example of "Triplex" Trustworthiness :-

DEAR SIRS,

.....While flying an Avro I crashed into a wireless car fitted with windows composed of your glass, hitting the car with such force as to completely smash in the whole of one side.

The sheet of glass was quite intact, but while being passed from hand to hand a few pieces were rubbed off.

The windscreen was also badly shattered but also held together in the same remarkable manner as the sheet of glass.

My goggles—also Triplex—were cracked all over and undoubtedly saved my eyes, since my face struck the forward edge of the cockpit with such force that it gashed my nose, necessitating seven stitches.

Yours, etc.,
XXXXXX XXXXX,
R.N.A.S.

Use "TRIPLEX" exclusively for GOGGLES, WINDSCREENS, WINDOWS OBSERVATION PANELS, Etc., Etc.

NAVAL.

The Casualty List.

Reported March 29th.

Accidentally Killed.—Jones, Prob. Flt. Officer A. V., R.N.
Missing.—Sands, Flt. Lt. Ll. A., R.N.
Moyle, Flt. Sub-Lt. W. A., R.N.
Seriously Wounded.—Bambridge, Flt. Sub-Lt. F. E. A., R.N.
Slightly Wounded.—Glen, Flt. Lt. J. A., R.N.
Accidentally Injured.—Ley, Prob. Flt. Officer G. V., R.N.
Thomas, Prob. Flt. Officer, A. H., R.N.
McLeod, Prob. Flt. Officer, H. J., R.N.
Previously reported Missing (Believed Prisoners) now reported Prisoners).—Hackman, Flt. Comdr. T. R., R.N.
Piper, Obsr. Lt. T. H., R.N.

Reported April 1st.

Died of Injuries.—Wimbush, Flt. L. E. B., R.N.
Missing (believed Killed).—Armstrong, Flt. Comdr. F. C., D.S.C., R.N.
Slightly Wounded.—Chisam, Flt. Lt. W. H., R.N.
Accidentally Injured.—Archer, Flt. Sub-Lt. A. W., R.N.
Quayle, Flt. Sub-Lt. S., R.N.
Grier, Prob. Flt. Officer E. G., R.N.
Simmons, Mr. A. H., Wt. Officer, II. Gr., R.N.A.S.

PERSONAL NOTICES.

Deaths.

JONES.—Prob. Flt. Officer Alan Vestey Jones, R.N.A.S., who was killed in an aeroplane accident in Lincolnshire on March 23rd, was the second son of Mr. and Mrs. David D. Jones, Strathleven, Oakleigh Park, London, N. He was 19 years of age.

WIMBUSH.—Flt. Lt. Lea Ewart Barnes Wimbush, R.N., who died on March 28th, of injuries received in a flying accident on the previous day, aged 19, was the eldest son of Mr. and Mrs. John Wimbush, of 13, Pembroke Gardens, Kensington. He was educated at Glengorse, Eastbourne, and at Haileybury. After leaving school he joined the R.N.A.S. in June, 1916, and went out to France in February, 1917. He was wounded in an air fight when flying over the enemy's lines in May of that year. For the last eight months he had been acting as instructor, and was just about to take up an appointment on active service.

Births.

CARTER.—On March 26th, to the wife of Acting Lt. Comdr. B. C. Carter, R.N.V.R. (née Penney), of 20, Bushnill Road, Upper Tooting, S.W.17, a daughter.

FELLOWES.—On March 20th, at 38, Lowndes Square, the wife of Wing Comdr. Peregrine F. M. Fellowes, D.S.O., R.N.A.S., of a son.

MILITARY.

G.H.Q. Communiqués.

March 26th, 9.20 p.m.—On the 25th inst. our aeroplanes were employed almost entirely in bombing the enemy's troops and transport massed in the areas behind the battle front, and in attacking them with machine-gun fire from a low height.

A total of 22 tons of bombs were dropped by us in this work, and over 100,000 rounds were fired from machine-guns. All our pilots reported that the ground targets offered by the enemy surpassed description, and that they were able to drop their bombs with accuracy, and to fire with effect right into the centre of infantry battalions in close formation, and into columns of cavalry and transport.

A certain amount of fighting in the air took place, but it was less intense than on the previous day. Thirteen hostile machines were brought down by our aeroplanes, and 10 were driven down out of control.

Eight of our machines are missing. The majority of our casualties were caused to low-flying machines by fire from the ground.

During the night our night-flying aeroplanes continued to bomb and to attack with machine-gun fire the enemy's troops in his forward areas, and his transport on the roads leading to the front.

March 27th, 10.5 p.m.—Great concentrations of our aeroplanes were carried out to-day over points threatened by the enemy, and masses of our machines attacked with machine-gun fire and bombs the enemy's infantry and cavalry.

Thirty tons of bombs were dropped by us, and hundreds of thousands of rounds of ammunition were fired into the enemy.

While this fighting was maintained throughout the day, our infantry aeroplanes kept watch along the front and reported the changes in the situation as they occurred

Twenty hostile machines were brought down in air fighting, and two other German aeroplanes were shot down by our anti-aircraft guns.

Twelve of our aeroplanes are missing.

During the night our night-flying squadrons kept up a continuous attack upon the enemy's troops in Bapaume, Cambrai, and Péronne.

Twenty-five thousand rounds were fired by them, and 24 tons of bombs were dropped on important centres of the battle front.

In addition, four tons of bombs were dropped on Valenciennes railway station, through which the enemy's troop trains were passing on their way to the front.

March 28th, 9.50 p.m.—On the 27th inst. low-flying was again carried out by large bodies of our aeroplanes, while our infantry machines continued the work of reporting the position of our battle line.

Over 30 tons of bombs were dropped by us, and a quarter of a million rounds of ammunition were fired from a height that ensured accuracy on different targets. Severe casualties are known to have been inflicted on the enemy, and the bringing up of his troops and ammunition was delayed.

Twenty-four German machines were brought down in air fighting, and seven others were driven down out of control. Two hostile observation balloons were also destroyed

Nineteen of our machines are at present missing, but a proportion of these are believed to have landed on our side of the line. Very heavy fire directed against our machines from the ground accounted for the greater portion of our casualties.

During the night the bombing of Bapaume, Bray, and Péronne was continued with the utmost vigour. Over a thousand bombs were dropped, and thousands of rounds of ammunition were fired at good targets, which were plentiful and easy to see in the moonlight.

Our pilots saw their bombs bursting in the middle of columns of troops and transport and on encampments.

Four of the aeroplanes employed are missing.

On the 27th instant the Sablons station at Metz was bombed. Well over a ton of bombs were dropped; good bursts were seen on the sidings and alongside the railway.

On the 28th instant our machines carried out a successful raid on the station at Luxemburg. Twenty-one heavy bombs were dropped, and several were seen to burst on the objectives.

All our machines returned from both raids.

March 29th, 8.50 p.m.—On the 28th inst. our aeroplanes carried on their attacks with bombs and machine-gun fire on hostile troops on the battle-front.

The majority of these attacks took place south of the Somme, in which area large concentrations of the enemy's troops were constantly reported.

The work was continued till dark in spite of rain storms and low clouds, a total of 26 tons of bombs being dropped, and nearly a quarter of a million rounds of ammunition fired by our pilots upon different targets.

Artillery work and photography were also carried out as usual on the quieter parts of the front.

There was not much fighting, considering the number of British machines in the air, but on the battle-front fire from the ground was again very heavy.

Nine German machines were brought down and five others driven down out of control. In addition, two hostile machines were shot down by fire from the ground.

Twelve of our machines are missing.

March 30th, 8.40 p.m.—During the morning of the 29th instant low clouds and rain greatly interfered with flying, but, in spite of the weather, valuable work was again accomplished by our aeroplanes.

Our machines were concentrated upon the battle front south of the Somme, where observers had previously reported large columns of the enemy advancing from the east. Many bombs were dropped and thousands of rounds of ammunition were fired upon these columns.

A good deal of fighting took place, the enemy's low-flying machines being particularly active in this area. Nine hostile aeroplanes were brought down and two others were driven down out of control.

Two of our machines are missing.

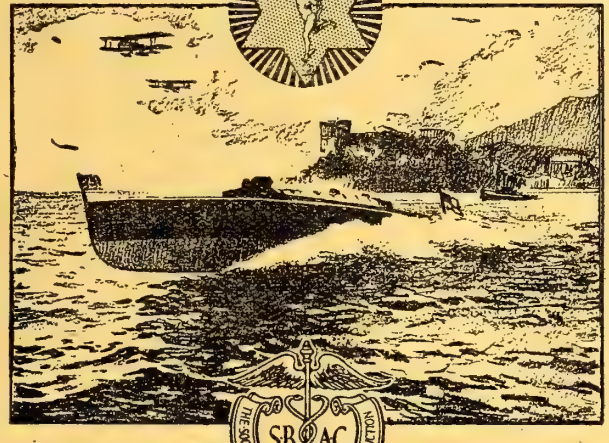
During the night over 12 tons of bombs were dropped on Bapaume and on roads in the vicinity, and also on roads and villages east of Arras. Direct hits were obtained on dumps and transport and on the railway line.

One of our machines has not yet been located.

March 31st, 8.48 p.m.—After midday on the 30th instant the weather completely broke, but, in spite of driving rain, our pilots continued to take part in the battle south of the Somme, and dropped bombs and used their machine-guns until a late hour on the targets offered by the enemy.

Useful reports as to the location of hostile troops were brought in, and in the northern area of the battle a certain amount of work in conjunction with our artillery was carried out.

There was heavy fighting in the air between our low-flying machines and those of the enemy. Twelve hostile aeroplanes were brought down and three others driven down out of control. One hostile balloon was destroyed by our machines, and another two German aeroplanes were shot down by our anti-aircraft guns



Five of our machines are missing.

April 1st, 9.29 p.m.—On March 31st our observation balloons and aeroplanes were active, the good visibility enabling the

former to carry out useful work in conjunction with the artillery.

The activity of our aeroplanes was chiefly centred south of the Somme. A close watch was kept on the enemy's movements in this area, and a large column of hostile troops or transport seen was bombed and engaged with machine-gun fire.

Very little fighting took place in the air. Two hostile machines were brought down and one other was driven down out of control.

Four of our machines are missing.

Four of our machines previously reported missing have since returned to their units.

Night flying was not possible till after midnight owing to low clouds. From midnight until dawn our bombing machines were constantly at work. Twenty-four tons of bombs were dropped on the railway stations at Douai, Cambrai, Bapaume, Rosières, and Thourout, and on the docks at Bruges.

Troops and transport in the neighbourhood of Bapaume and Chaulnes were also attacked with bombs and machine-gun fire.

All our machines returned.

War Office Communiqués.

March 27th.—The G.O.C, Palestine, reports:—

During the fighting of the 25th one enemy aeroplane was destroyed in aerial combat.

March 28th.—The G.O.C. Palestine reports:—

Our aeroplanes shot or drove down four enemy machines, and heavily bombed the enemy troops, transport, and trains on the Hedjaz railway, many direct hits being observed.

March 29th.—The G.O.C. Macedonia reports:—

On the morning of March 20th an enemy aeroplane was driven down behind our lines in an aerial fight on the Struma front. The pilot and observer were taken prisoners.

On the morning of March 24th our machines bombed the aerodrome at Drama with great success; 57 bombs burst on the aerodrome, and four hangars were badly damaged.

March 31st.—The G.O.C. Palestine reports:—

On March 28th and 29th our operations to the east of the Jordan was continued successfully. Two hostile aeroplanes were destroyed.

March 31st.—The G.O.C. Italy reports:—

The success of the Flying Corps has continued. Ten enemy aeroplanes have been destroyed and four driven down out of control since my last report, with a loss of one to ourselves.

In this total is included seven machines destroyed, and three driven down out of control on March 30th. On this date a patrol of three British machines attacked 19 enemy aeroplanes over an enemy aerodrome east of the Piave, destroying six of them.

Since their arrival in Italy the Flying Corps have now destroyed 83 enemy machines, and only lost 10 themselves.

* * *

The Secretary of the War Office announces that the King has been pleased to approve of the award of the Victoria Cross to Sec. Lt. (Temp. Capt.) James Byford McCudden, D.S.O., M.C., M.M., R.F.C., for conspicuous bravery, exceptional perseverance, keenness and very high devotion to duty on various occasions during December, 1917, and January and February of the present year. The award will appear in the "London Gazette" at an early date.

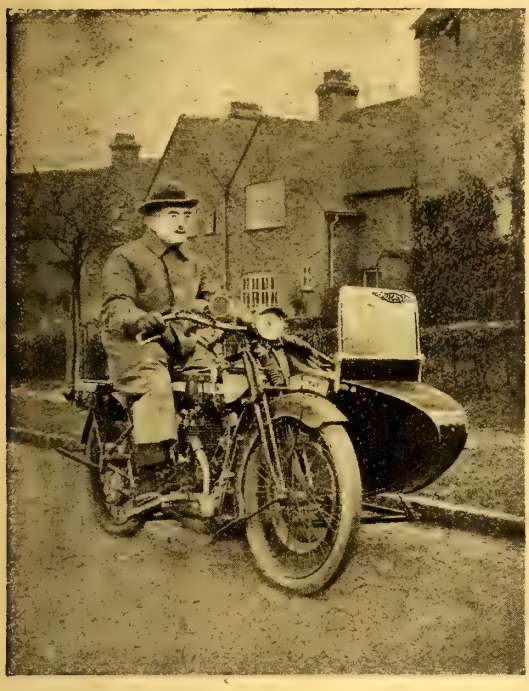
Died

March 19th, A.F.C.—Morgan 1130 A.



PERSONAL NOTICES.

Deaths.

ANDERSON.—Capt. Edward Kerr Anderson, R.F.C., who died as the result of a flying accident at Winchester on March 16th, was the youngest son of W. J. Anderson, Glasgow. He was 21 years of age.

Capt. Anderson was 21 years of age and the youngest son of Mr. William J. Anderson, of Glasgow. He had his captaincy in the Army in March of last year, when he was appointed flight commander, R.F.C. He was an experienced pilot, and very popular with all ranks at Wing headquarters.

ANGUS.—Capt. Robert Edward Angus, Ayrshire Yeo. and R.F.C., who was reported as missing on November 20th, 1917, and is now reported dead, was 23 years of age. He was educated at St. Ninian's, Moffat, and Loretto, and, on leaving school at Easter, 1914, before going up to Cambridge in the autumn, he obtained a commission in the Ayrshire Yeomanry, and was mobilised on the outbreak of war. He went out to Gallipoli with his regiment in the autumn of 1915, and, after the evacuation of the Peninsula, he saw service with the Yeomanry in Egypt and also for a time with the armoured cars. He applied to join the R.F.C., and trained in Egypt and afterwards in this country, and went out to the front with his squadron last October. After a month's service he was promoted flight commander (being described by his commanding officer as the best pilot in the squadron) and was due to leave his old squadron on the morning of an attack, but at his own request he was allowed to take part in it. He was last seen, in the mist which prevailed that day, leading his squadron, about five miles behind the lines, to drop his bombs on a German battery, which he put out of action. No further details of his fate have since been ascertained except the news of his death through German sources. Capt. Angus was the only son of the late James Angus, J.P., of Ochiltree House, Ayrshire, and of Mrs. Angus, of Hill House, Leckhampton, Cheltenham, and grandson of Mr. Robert Angus, D.L., of Ladykirk, Ayrshire.

Get into touch with "ASCOL" Representatives

IN order to bring our business into closer touch with Aircraft Manufacturers throughout the country, we have now appointed representatives in Lancashire, Yorkshire, the Midland Counties, and Ireland (*see below*). We shall shortly appoint other representatives for the Eastern and Western Counties, details will be announced later. Three representatives are attached to our Head Offices at Long Acre for the London District.

These gentlemen will call regularly, and will keep firms posted as to stocks in hand and deliveries expected. We trust that our clients will make use of their services, to the advantage of all concerned.

ASCOL

BARLOW.—A verdict of "Accidental death" was returned at the inquest at Dover on March 20th on the body of Lt. Harold Loftus Barlow, R.E. and R.F.C., who was killed while flying at dusk owing to his being caught in a mist which came up suddenly.

BUTLER.—Capt. Desmond George Butler, Leinster Regt., attd. R.F.C., killed while flying on March 17th, aged 23, was the elder son of the late Capt. G. J. Butler, R.E. He was educated at Plymouth College and joined up the day war was declared and was sent to France on August 25th. A few months later he was recommended for a commission, which he obtained in the 1st Leinster Regt. He was wounded in the battle of Ypres in 1915. On his return to the front in September he was attached to the trench mortars and promoted lieutenant in February, 1916, and captain in March, and given the post of D.T.M.O. on the Headquarter Artillery Staff of a division, He was present at the battles of the Somme, Arras, and Vimy Ridge, being mentioned in dispatches for his excellent work. In August, 1917, he applied for a transfer to the R.F.C. and came to England for his training and at one aerodrome he had acted as adjutant since Christmas. He was a true sportsman and a general favourite in his squadron and gave every promise of becoming a daring and brilliant aviator.

CAMPBELL.—Maj. Charles Duncan Miles Campbell, R.F.C., who died at Matlock on March 9th, was the son of the late C. Campbell and of Mrs. Campbell, of 17, South Vale, Upper Norwood, and the husband of Mrs. Campbell of Worbeck Road, Anerley. He was 36 years of age, and received his commission on the outbreak of war, proceeding to France in August, 1914. At the end of the year he was transferred to the R.F.C., where he served as an observer and specialised in the photographic section. He visited Italy, Canada and the United States in connection with important duties, and he was commanded by the King to exhibit to him certain photographs taken from aeroplanes. Maj. Campbell was a M.O.B.E.

CARTWRIGHT.—Sec. Lt. Ronald W. St. George Cartwright, R.F.C., who was killed on Feb. 26th, was the second son of Mr. Arthur Cartwright, late H.M. Inspector of Schools for the Worcestershire District, and of Mrs. Cartwright, of Rothbury, Hay, Hereford, and grandson of the late Colonel Heywood, of Great Malvern. He was one of three brothers in the Forces, the youngest of whom, Sec. Lt. Eric Cartwright, 4th Leinster Regiment and M.G.C., was killed in the battle of the Somme in 1916. He was educated at Bilton Grange, Rugby, and Malvern College. He had only been a few months in British Columbia when war broke out, and joining up immediately in Victoria he came over with the Canadian contingent early in 1915. After only a few days in England his company was ordered out to reinforce the Canadians at Ypres, and with the 16th Canadian Scottish he served through all the fighting there and in the charge at Festubert. On one occasion he was buried by a big shell, and shortly afterwards was invalided home, and had to undergo an operation for appendicitis. He suffered from shell shock for 18 months, but made a marvellous recovery, and almost before he was really fit again he obtained a commission in the R.F.C., and went to the front in September, 1917.

CASSWELL.—Lt. Eric Denison Seymour Casswell, Rifle Brigade, attd. R.F.C., was the youngest son of Mr. and Mrs. Casswell, of Rusper, Sussex. He was a scholar and exhibitioner at Tonbridge School, where he was in the cricket XI., and proved himself a good all-round athlete. From Tonbridge he gained a scholarship at Pembroke College, Cambridge, and he had been in residence there a year when war broke out. He obtained a commission in the Rifle Brigade. For a time he was attached to the Army Cyclist Corps, and he went to France early in 1915. On rejoining the Rifle Brigade he saw much fighting, and twice he was wounded slightly. In the summer of 1917 he came to England to be trained for the R.F.C., returning to the front early in October as an observer in a night-flying squadron. With his pilot he was killed in action on the night of November 7th, 1917. Mr. Casswell was 23 years of age.

CHATTERTON.—Capt. Roden Latham Chatterton, Leinster Regt., attd. R.F.C., who died in hospital on March 29th from injuries received in a flying accident on March 27th, was the only son of Col. G. D. L. Chatterton, Ind. Army, and Mrs. Chatterton. He was 22 years of age.

CLARK.—On March 20th Sec. Lt. Eric Alan Clark, R.F.C., was accidentally killed while flying. He was the only son of Mr. and Mrs. C. W. H. Clark, "Fernhurst," Aughton, and was 20 years of age.

COLEY.—Lt. Allan Cowan Coley, R.F.C., who was killed on active service on March 6th, was 19 years of age, and the eldest son of the late Harry C. Coley, of Bishops Stortford, and of Mrs. E. R. Holland, of Surbiton. He had his commission in the Army in August, 1916, and was given his "wings" in the Royal Flying Corps in April of last year.

COOK.—Lt. F. R. Cook, East Yorkshire Regt., attd. R.F.C., whose death has already been notified, transferred to the R.F.C. when in India in Dec., 1916, and was appointed an observer in Feb., 1917, with seniority from Dec. 15th, 1916. He commenced his training in India, and was subsequently transferred to Egypt, where he was afterwards appointed an instructor.

CORBETT.—Maj. R. D. de la Cour Corbett, Ind. Inf., attd. R.F.C., who was born in 1881, was the elder son of the late Col. R. de la Cour Corbett, D.S.O., R.A.M.C., and Mrs. de la Cour Corbett, of 13, Goldington Road, Bedford, and was educated at Bedford and Sandhurst. He was a keen athlete and sportsman, and played Rugby football for the R.M.C. against the R.M.A. in 1900. In 1901 he was gazetted to the Royal Irish Rifles and served through the South African War, being awarded the medal with four clasps. In 1904 he transferred to the Indian Army and was gazetted to the 48th Pioneers, and afterwards became adjutant of the regiment. In 1908 he was sent on famine duty in the Utroula District, and in 1912 was appointed tutor to the young Raja of Awa. When war broke out he rejoined his regiment and went to Mesopotamia in November, 1914. He was one of the gallant band who under General Townshend were besieged for five months in Kut, and was taken prisoner at the fall of that garrison and sent to Kastamuni, in Asia Minor. He was mentioned in dispatches in May, 1916. The camp at Kastamouni was broken up in October, 1917, and the prisoners marched to Changri, where he died on Christmas Day.

One who shared captivity with Maj. Corbett says:—

"The Turks have treated officer prisoners fairly well, and anybody who, like the writer, saw him at that place, fit and cheerful, a few months ago, would not have thought it possible that he would not survive the war. Maj. Corbett died suddenly from rupture of the heart, on return from tobogganing at Changri, whither all the prisoners had been moved. There was no better-liked officer at Kastamuni. He was the staff officer of one of the two parties into which the 200 prisoners, nearly all from Kut, were divided, and was the channel of communication between the prisoners and the Turkish authorities. He filled this unenviable position with tireless energy and tact, and no one who shared captivity with him will ever forget his cheery presence and unfailing readiness to help. In spite of his many duties he found time to run a carpenter's shop and also to work daily for some months at the head of a party of officers who enclosed the graves of prisoners who died at Kastamuni.

COSTA.—Sec. Lt. Liugi G. Costa (Instructor), R.F.C., who was killed in Norfolk on March 19th, as the result of an aeroplane accident, was the eldest son of Cavaliere and Signora Costa, of West Hill, Sydenham, and Pudding Lane, E.C. He was educated at Dulwich College, where he was captain of the first Cricket XI. He was also a good football player and an excellent swimmer and oarsman. He enlisted in the R.F.C. in March, 1917, and shortly afterwards gained his commission, being awarded his "wings" last January, since when he had been doing good service as an instructor. He was 18 years and 9 months of age.

COWIE.—Sec. Lt. George Cowie, R.F.C., reported missing on October 22nd, now officially reported killed on that date, in his 19th year, was the only son of Captain and Mrs. A. M. Cowie, of Dufftown, Banffshire. He was educated at Alton Burn, Nairn, in Brussels, and at Rugby (Schoolhouse), and was in the school eleven, and in the swimming six. He was killed as the result of a collision during an engagement in the air, and fell behind the enemy lines.

CUBBON.—Capt. Francis Richard Cubbon, M.C., R.F.C., who is reported killed on June 9th, 1917, was born in Poona on Nov. 29th, 1892, and was the only surviving son of Capt. R. Cubbon, S. and T. Corps, I.A., and of Mrs. Cubbon, of Quetta. He was educated at Alleyne College and Dulwich College, and passed from Sandhurst into the Indian Army in 1911, being attached for a year to the Yorkshire and Lancashire Regiment in Karachi, and then appointed to the 72nd Punjabis, with whom he served on the North-West Frontier. In November, 1915, he was invalided home and on recovering was attached to the Royal Warwicks and then to the R.F.C. He went to France as an observer on April 7th, 1917, winning his Military Cross on May 10th and a bar to it three days later—both being awarded for "splendid performances." Although only two months at the front Capt. Cubbon brought down more than 23 enemy machines.

DALE.—Sec. Lt. A. P. Dale, who has been accidentally killed whlise flying in Egypt was, before the war, the Unionist agent at Chesterfield.

DAVIES.—"Accidental death" was the verdict recorded at Oxford on March 18th on Lt. Llewellyn C. Davies, R.F.C., who died in hospital of injuries received in a bad landing at Abingdon.

DAWSON.—Lt. H. Percy Dawson, R.F.C., was killed at a Hampshire aerodrome recently. He was 27 years old and lived at Hardslea, Crouch End. He had seen much service overseas. Mr. Dawson, at the time of his death, was about to return to France.

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

The Design and Construction of Internal Combustion Engines, with special reference to Aero Engines.

BY C. SYLVESTER.

Author of "The Conversion of Electrical Machinery," "Testing Motors and Motor Starters," etc., etc.

INTRODUCTION.

In dealing with the design of the internal combustion engine, the first thing to be taken into consideration is the purpose for which the engine is to be used. Having definitely ascertained this, the details of the design and construction may be carried out with the certainty that the results will meet the requirements. From this it is meant that engines that are designed for one class of work are not so satisfactory when required to do other work. Considerable care should therefore be taken to obtain a correct idea of the load before the design is commenced.

Internal combustion engines may be divided into three types:—

1. The petrol engine (including aero engines).
2. The oil engine (Diesel, semi-Diesel, and oil).
3. The gas engine.

The Petrol Engine.

The aero engine is a petrol engine almost in a class of its own, its feature as a prime mover being that it is designed solely for use in connection with aircraft. As such it may truly be said that the whole of the design is carried out to meet aeronautical conditions, not only as far as weight is concerned, but from an efficiency point of view. That is, if we really can have a maximum efficiency with a minimum amount of weight, then we may say that the aero engine of to-day adequately meets these requirements.

The production of the charge of a petrol engine may be said to be that petrol flows from a tank to a carburettor fitted on or near the engine. The petrol is vapourised in the carburettor and mixed with air by the suction of the piston. The mixed petrol gas and air are drawn through the induction pipe into the cylinder. Here the mixture is exploded by a spark across the points of a sparking plug, the spark being produced by means of a magneto driven by the engine, or by an accumulator operating a coil.

The Diesel Engine.

In dealing with the Diesel engine we are considering a very different type from the aero engine, from many points of view. One instance is that where an aero engine depends upon the electrical sparking of a plug, there is no ignition necessary from external sources to produce combustion in a Diesel engine.

Briefly to explain how combustion is brought about in a Diesel engine, it may be said that ordinary air is admitted into the cylinder and compressed to about 480 lbs. per square inch. This compression causes the temperature to rise to as much as 1,000 degrees Fahrenheit, and, when thus compressed, a spray of petroleum vapour is injected which is instantly burnt.

Diesel engines are now constructed in sizes up to 4,000 h.p., and, at one time, this type of engine was regarded as the serious opponent of the steam engine. As a matter of fact, as far as cost, maintenance, and efficiency are concerned, it may be said to be superior to the steam engine. It is certainly used at the present time under conditions where it is not possible to use the steam engine, one of these conditions being the propelling of the submarine.

As far as the design of Diesel engines is concerned, we do not have to take weight into consideration, as we do when designing an aero engine. From this it is not advocated that unnecessary material should be used in the construction of these engines, but one does suggest that as the limits of aero engine construction are cut so fine, it is really practical to allow a greater margin for material. There is a great deal of scope for improvement in the design of Diesels which will, no doubt, be used to advantage, as in some quarters it is regarded as the engine of the future. As regards thermal efficiency it is quite 25 per cent. ahead of the gas engine, it also has the advantage of being able to use crude petroleum oil, of which supplies are available in large quantities in almost every part of the world. This, of course, is of the utmost importance where the cost of fuel is concerned, especially at the present time.

Apart from its undoubted advantage over the steam engine as a prime mover for submarines, this engine is looked upon as the type of engine to adopt in small electrical power stations. Here, coupled direct to an alternating current or a direct current generator, it is far superior to the steam engine. This will be readily understood when the cost of erection and the maintenance of steam pipes, boilers, etc., are considered.

The Gas Engine.

We will now turn our attention to the gas engine. This type of engine, in comparison with the Diesel and the steam engine, falls much below them from an efficiency and economical point of view. It has the advantage, however, of being manufactured in such small sizes as to be appreciated for such work as driving main shafting in small workshops, and driving small generators, etc. Gas engines are also made in large sizes, 3,000-h.p. being quite common. Alongside the steam engine, these engines, if operated with producer gas, compare very favourably. The greatest drawback to the adoption of gas engines as a prime mover is that it is not always possible to obtain the gas for them. Where this is so, then the oil engine is to be preferred.

Oil Engines.

Oil engines are extensively used for small electrical installations. They can be started up in a very few minutes, after which very little attention is necessary. As far as the explosive charge of these engines is concerned they differ to every other type of internal combustion engine.

To explain briefly the production of the working charge it may be said that a cast iron container, termed a vaporiser, is fitted on the back end of the cylinder. Before the engine may be started, the piston must be placed at the commencement of the explosion stroke. The vaporiser is then made hot by means of a large paraffin blow lamp, and, when sufficiently hot, a spray of oil, and air compressed to about 60 lbs. per square inch, is injected into it. The explosion takes place, and the charge is forced into the cylinder, thus forcing the piston out. A camshaft controls the inlet and exhaust valves after the engine is once started.

In General.

From the above brief survey of internal combustion engines it will be seen that each type varies from the other more or less. As prime movers they are suitable for special work, but they must, at the present time, be considered practically useless for large generating stations when compared with the capabilities of the steam turbine.

From this one does not mean to state that it is not possible to produce an internal combustion engine to compare favourably with a steam turbine up to a certain horse-power, but one does say that, so far as the present design goes, it is not possible to produce one of anything like the capacity of the latest Curtis turbine, that is, 40,000 kilowatts.

As stated above, there are possibilities for the improvement

of the design of internal combustion engines, just as the steam turbine is an improvement on, yet a distant departure from, the steam engine. It is true that experiments have been recently carried out to combine the gas engine and the steam turbine, but it must be pointed out that, at the present time, a steam turbine plant operated from the waste heat from a gas engine involves a large expense in comparison with the increased power obtained. Should the cost of boiler fuel, however, be sufficiently high, a plant of this description might be commercially practical, but one fears that the matter will not receive serious consideration for some time to come.

In a gas engine one has high efficiencies at the high temperature end of the cycle, but one is unable to use the low temperature end. With the steam turbine, when modern condensing apparatus is used, the low temperature end of the cycle is used to the fullest extent. It would therefore appear that there are great possibilities in combining the two. However, on working out an actual case, it will be found that the work of the turbine would be comparatively small, really amounting to about 10 per cent. of the total output of the gas engine. From this it will be seen that the large amount of additional expense and complication involved would offset the saving in the cost of boiler fuel, that is, unless the fuel is comparatively expensive.

Metals and Alloys used in the Construction of Internal Combustion Engines.

A brief survey of the chief metals and alloys used in the construction of internal combustion engines will assist the student in the understanding, in a general way, of their make-up, value, and utility.

Aluminium.

In describing aluminium we would say that it is white in colour with a slight bluish-grey tinge. It is very light, highly malleable, but when pure it is too soft and weak for most purposes. It will unite with all metals except lead and mercury. It is attacked by most acids and alkalies, but it is unaltered by dry or moist air at any temperature.

The heat conductivity of aluminium is very high, being almost equal to that of copper.

Its electrical conductivity is about that of copper, but it is to be preferred to copper under certain conditions owing to its extreme lightness.

The tensile strength of aluminium varies according to its alloy and the form in which it is used. Sand castings have a tensile strength of 5 tons per square inch. Hard drawn aluminium wire has a tensile strength of 15.5 tons per square inch. If aluminium is mixed with about 7 per cent. of nickel it makes a very valuable hard alloy. Nickel-aluminium alloys have the same springy qualities of hard-drawn brass.

The specific gravity of aluminium is 2.6, the specific heat is .212, and its melting point is 658 degrees Centigrade.

An alloy of aluminium and zinc is used in the construction of aero engine parts, the percentages being 90 and 10 respectively.

Copper.

This metal is a peculiar red in colour and it is extremely tough. It is easily machined, may be drawn into very fine wire, or beaten into thin sheets. It is only slightly weldable and it is very brittle at temperatures approaching melting point.

Its electrical conductivity is extremely high, and when manufactured in hard-drawn sheets it is extensively used for the construction of the commutators of direct current motors and generators.

The specific gravity of copper is 8.7, its specific heat is .044, and its melting point is 1,083 degrees Centigrade.

Outside the electrical industry copper is not extensively used, but as an alloy with tin, zinc, aluminium, or nickel, it is the most used of all metals.

Tin.

This metal is white in colour with a faint yellow tinge. It is very soft and is easily rolled into sheets, but owing to its very low tenacity it cannot be drawn into wire. It is only slightly affected by exposure to air.

As an alloy with copper it is extensively used for pumps, gears, propellers, bushings, steam fittings, etc.

The specific gravity of tin is 7.29, its specific heat is .056, and its melting point is 232 degrees Centigrade.

Zinc.

This is white in colour and is very brittle. It may be rolled into sheets or drawn into wire at temperatures between 100 and 150 degrees Centigrade. At higher temperatures than this it is very brittle. As an alloy with copper it is in great demand.

Its specific gravity is 7.15, the specific heat is .024, and its melting point is 419 degrees Centigrade.

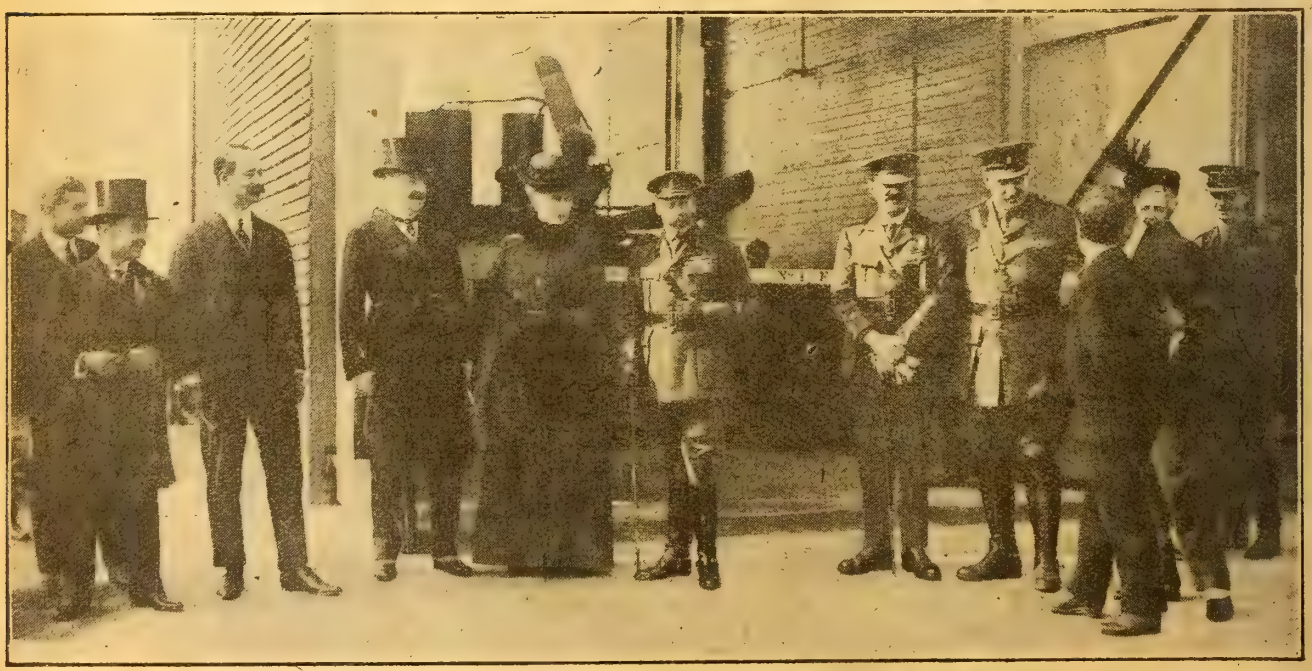
Antimony.

This a very peculiar metal, inasmuch that it is very brittle and crystalline and that it imparts this property to its alloys. It is white in colour and is easily powdered.

The specific gravity of antimony is 6.7, its specific heat is .051, and its melting point is 631 degrees Centigrade.

As an alloy with tin and lead it is valuable for white bearings, metallic packing, accumulator metal, electric fuse wire, hard solder, plumbers' metal, etc.

Copper-Tin.



From the alloy of copper and tin we obtain gun-metal, bronze, and phosphor-bronze. The quantities of the respective metals are:—

Gun-metal.—88 per cent. of copper, 10 per cent. of tin, and 2 per cent. of zinc. The zinc is added giving fluidity to the alloy.

Bronze.—90 per cent. of copper, and 10 per cent. tin.

Phosphor-bronze.—91 per cent. of copper, 8.5 per cent. of tin, and .5 per cent. of phosphor.

The above alloys are used in the manufacture of bearings, small gears, pump bodies, connecting-rod bushes, etc.

A ROYAL VISIT: The King and Queen at the Works of Clement Talbot, Ltd. Their Majesties, with Lord Shrewsbury and Mr. Frank Shorland, in front of one of the Engine Test Sheds, receiving the Staff.

Britain Supreme in the Air!

ROLLS-ROYCE AERO ENGINES

like Rolls-Royce Cars are the best in the World. By their wonderful achievements they are making Britain and her Allies Supreme in the Air.

Describing the historic flight from London to Constantinople in thirty hours the "Autocar" says:

"The fact must be recorded that the Engine never failed for a moment throughout the entire journey to Constantinople. Great therefore as was the reputation of the Rolls-Royce Engine before the flight, the epic achievement described added new laurels to its wonderful career."

ROLLS-ROYCE

Contractors to H.M. Government. LTD.

Telegrams: 'Rollhead Reg, London.' *Telephones: 1654 Gerrard (3 lines)*

AND AT DERBY, PARIS, NEW YORK, MADRID, BOMBAY, ETC.

Copper-Zinc.

From this alloy we obtain all our brasses.

Soft yellow brass consists of 70 per cent. copper, 29 per cent. zinc, and 1 per cent. tin.

Manganese-brass, or bronze as it is sometimes termed, consists of 59.5 per cent. copper, .5 per cent. tin, 39.5 zinc, and .5 per cent. of aluminium.

This is a valuable alloy of vastly improved tensile strength and elastic limit. It is used for general work, tubes for high pressure such as oil pipes, etc. One of the features of this alloy is that it resists corrosion.

Copper-Tin-Antimony.

The correct quantities of this alloy are: 4 parts of copper, 1 parts of tin, and 8 parts of antimony. This produces an excellent alloy which is extensively used for lining bearings. It is sometimes termed "Babbits metal."

Duralumin.

This is a complex alloy and it has created a great deal of attention in engineering circles. It is an alloy of aluminium, copper, magnesium, and manganese. The percentage of aluminium is upwards of 90 per cent.

It has a specific gravity of 2.79, its tensile strength is over 25 tons, and it can be hardened by heat treatment. The casting temperature of this alloy is about 640 degrees Centigrade.

Magnalium.

This is an alloy of aluminium and magnesium. It is much lighter than aluminium and it has a tensile strength of about 20 tons per square inch according to its composition. It is an excellent alloy for castings, these being very clean. It can be soldered and welded, and at certain temperatures it may be forged.

Its specific heat is about .2184 degrees Fah., and the melting point is about 1200 degrees Fah.

Steel.

There are two classes of steel used in the construction of engines—"hard" and "mild."

In order that we may understand the uses and properties of steel it is essential that we should know something about iron. Impure iron, sometimes termed "pig iron," is used as a raw material for the product of iron and steel. Pig iron contains a little more than 1.5 per cent. of carbon. It is very brittle and coarse and it is used, with ordinary scrap iron, in the foundry for all kinds of castings.

Wrought iron is nearly pure iron. It is very tough and of a fibrous nature, and it really consists of small masses of soft iron welded together. It does not contain more than .2 per cent. of carbon, but it contains a certain amount of slag and oxide which is apparent in the form of fibre.

Mild steel is really of the same composition as iron, but it is practically free from slag and oxide. All varieties of iron, except wrought iron, that contain less than 1.5 per cent. of carbon are termed "steel." If the steel contains less than .5 per cent. of carbon it is termed "mild steel," if more, "hard steel." From this it will be seen that the two classes of steel pass gradually into each other, but it is very difficult to determine the exact line of separation.

Very hard steel contains about 1.5 per cent. of carbon. This steel is much too hard for ordinary constructional purposes, and it is chiefly used in the manufacture of keen-edged tools. The grades of steel vary according to the amount of carbon they contain, but, special processes are adopted to produce various qualities for certain purposes.

In the construction of internal combustion engines, steel of all grades is used. Where ball or roller bearings are adopted, special steels, and special methods for hardening, are used.

Some steel is suited for certain purposes if it is hardened by quenching in water, other classes of steel meet the requirements if it is quenched in oil. Again, some classes of steel are entirely satisfactory if they are simply submitted to a blast of cold air.

For the present it may be said that mild steel is used for such items as bolts, nuts, studs, washers, or portions of constructional details that are not subjected to severe wear, strain, or shock.

As far as the actual purposes for which hardened steel is used, this will be dealt with adequately as the design of each part is considered.

(To be continued.)

THE ITALIAN AIRCRAFT INDUSTRY.

Mr. Lorenzo Santoni, who will be remembered as one of the moving spirits in the Deperdussin business in this country and also introducer of the Anzani engine, is now recognised as one of the leading spirits in Italian aviation. It is some time since he established the Savoia aeroplane business, manufacturing machines under Farman licence. This business has been a great success, and as a result the firm is now producing machines of its own type which are said to be highly satisfactory.

Recently Mr. Santoni started a new firm, known as the Societa Idrovolanti Alta Italia, or more familiarly as the S.I.A.I. This firm, which is located at Sesto Calende, is the largest hydro-aeroplane factory in Italy, and is chiefly concerned with the manufacture of flying boats which are largely used by the Italian Navy for work on the Adriatic.

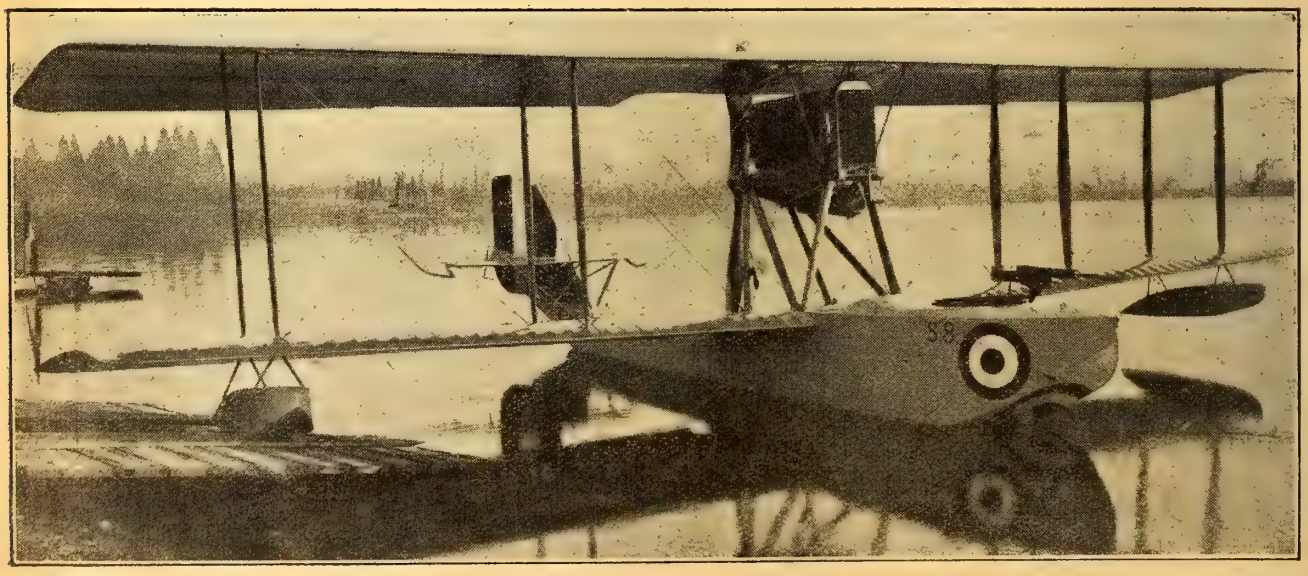
Mr. Santoni is now concerned with the following firms which seem to embrace practically every aeronautical activity with perhaps the sole exception of the actual manufacture of engines:

Societa Generale Imprese Aeronautiche, Via Silvio Pellico N. 12, Milano.

Societa Trasporti Aerei Internazionali, Via Manzoni N. 5, Milano.

Agenzia Generale Forniture Aeronautiche, Societa Anonima, Via Pr. Amedeo N. 11, Milano.

Societa Italo Orientale Emaillite, Via Felice Cavallotti, Musocco, Milano.



Societa Anonima Costruzioni Aeronautiche "Savoia," Bovisio Mombello, Milano.

Societa Anonima Costruzioni Aeronautiche "Savoia," Ufficio Tecnico, Via Felice Cavallotti, Musocco, Milan.

Societa Generale Industrie Aeriennes—Paris—44, rue Taitbout.

IN MEMORIAM.

Vickers, Ltd., have subscribed £500 for a bed in the Weybridge Hospital in memory of the late Mr. Harold Barnwell.

BRITISH MAGNETO PRODUCTION.

Owing to a misprint in the paragraph at foot of column 2 on page 990 in the issue of The Aeroplane of March 13th an unfortunate error occurred.

The number of Magnetos supplied up to the end of 1917 by the British Magneto Industry was 300,000—not 30,000 as stated. It gives one pleasure to correct the error.

A NEW DISCOVERY IN STEEL.

Particulars are now available of a new hardening method which the inventor of the New Steel has discovered.

Cobaltcrom steel tools treated by this method are proving to have a greatly enhanced staying power in comparison with those treated according to the original instructions. In many cases tests have proved the increased efficiency to be as high as 50 per cent. The operation is so simple and sure that from the hardening point of view the New Steel becomes practically fool-proof.

Normalising is now entirely dispensed with and hardening is effected by one operation only.

Instead of taking tools from the muffle immediately the correct hardening temperature has been attained, the feature of the new treatment is that they should remain in the muffle and be subjected to a slightly falling heat prior to being exposed to natural air cooling.

The inventor of Cobaltcrom steel has worked out an ingenious heat-controlling device which, though the whole outfit only costs a few shillings, is claimed to be more effective and reliable for muffle heat checking than the most expensive pyrometer installation.

The advantage of this device over the ordinary pyrometer system is that both the maximum heat and the falling heat referred to are accurately recorded in the zone of the muffle in which the tool is heated. The device consists of calibrated metallic salts named "Pyreks Heat Indicator Compound," which melt and solidify at definite temperatures, and which are used in combination with small spoon-shaped receptacles made from a patent non-scaling, acid-resisting and rapid heat-conducting alloy (also invented by the originator of Cobaltcrom steel), called "Reactal."

For hardening tools which have to retain keen cutting edges and are not subject to shock 1,000 C "Pyreks" Compound is used, and for tools which are subject to severe shock 900 C "Pyreks" Compound is applied, these two temperatures being the correct treating heats for these classes of tools.

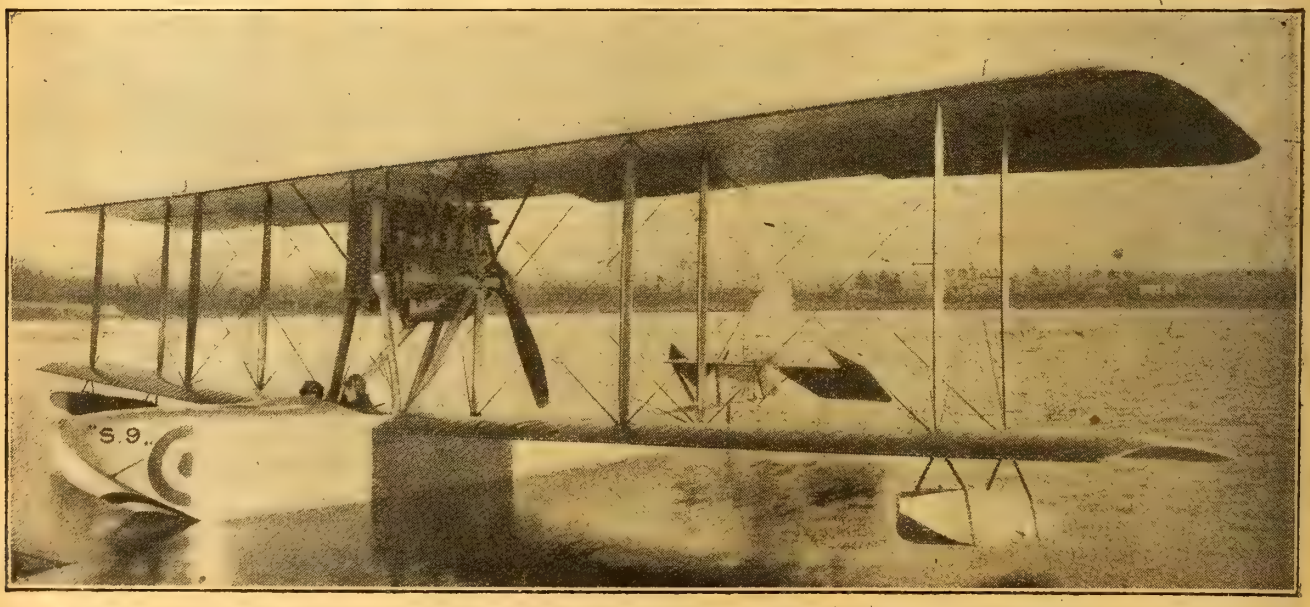
"Pyreks" Compound is also prepared and calibrated for other temperatures.

The hardening instructions are as follows:—The tool to be hardened in the muffle is first heated uniformly to a cherry red. The "Reactal" spoon containing the "Pyreks" Compound is then inserted and placed on or alongside the tool. When the "Pyreks" Compound becomes quite liquid the gas or blast is turned off or, as an alternative, the tool, together with the "Reactal" Spoon, is slightly withdrawn towards the cooler zone at the muffle opening. The "Pyreks" Compound is then watched until it begins to re-solidify, at which point the tool is taken from the muffle and exposed to still air, thus completing the hardening operation.

Shops not possessing a regular muffle can adopt the system with equally satisfactory results by using a smith's hearth and making an improvised muffle by inserting in the coke or coal either a tube closed up at one end or a small plumbago crucible. Further particulars can be obtained from Darwin and Milner, Ltd., or Sybry, Searls, Ltd., Sheffield.

Signor D. Lorenzo Santoni, formerly of the British Deperdussin Co., Ltd., and now one of the leading men of the Italian Aircraft Industry.

MESSES.



Greenville-on-Sea,
March 14th, 1918.

Dear Sir,—I was very interested to see in your recent issue an illustration of "a typical R.F.C. Mess," and would suggest that you follow this up with a series of other messes, as for instance:—

A typical Air Board Mess.
A typical A.I.D. Mess.
A typical R.A.F. Mu— (I mean Mess), etc., etc.

There are no doubt many other "messes" that you would like to illustrate, but which you dare not owing to Government regulations.

I am, dear Sir, yours most respectfully,
A Constant Reader.

An S.I.A.I. Flying Boat, Reconnaissance Type, with Seats Side by Side.

WE MANUFACTURE

RADIATORS . OIL COOLERS . COWLS . TANKS
MANIFOLDS . EXHAUST BOXES . SPINNINGS
AND AERONAUTICAL SUPPLIES OF ALL KINDS

We have reduced the Radiator Factor to

X

X in this case is not an unknown quantity, but war conditions necessitate us hiding our light under a bushel—except—to Aero constructors employed on Government work.

Our latest radiator supplied to cool the famous **200 h.p.**——engine, weighs only **21 lbs.,** half the usual weight.

This is a commercial proposition and not an experiment. It is produced in large quantities and is the strongest, lightest, and most serviceable radiator yet produced.

WE DELIVER TO AIR COUNCIL ALLOCATION

Our designers and experience are always at our customers' disposal.

The "Guardian Angel" Parachutes

THE GUARDIAN ANGEL PARACHUTES
TRADE MARK
(REGISTERED)

THE CLASS OF OUR LIFE-SAVING EQUIPMENT.

The basic characteristics of our Parachutes, which differentiate them from all others, and for which we hold master-patents, are automatic (i.e., compellative) opening, and static and kinetic control (i.e., control at rest and in action) of all their component details. The ordinary parachute is under no sort of control, and what we have accomplished is to convert this most insubordinate Apache of the Air into a staid servitor, incapable of acting in any other than the designed way. We have made the Parachute into an automatic machine, so that failure to open and entanglement of rigging has become a physical impossiblity. Every Type of Parachute made by us possesses these paramount and indispensable principies of machine action. The aviator makes his jump, and the Parachute automatically does the rest.

THE RANGE OF OUR LIFE-SAVING EQUIPMENT.

Life-saving Parachutes for school machines on the Training Grounds.

Life-saving Parachutes for heavy bombing machines, fighters, and scouts.

Life-saving Parachutes with minimum weight and without additional air resistance for the fastest machine that flies, and capable of release from any vertical or horizontal angle, or when flying upside down.

Solo-Parachutes for use from Airships and Observation Balloons, with a high but constant-speed initial drop from a fired gas-bag, automatically opening into the low-speed descent required for a safe landing.

Basket-Parachutes for instantly detaching the basket containing two observers, their instruments and records, from a fired gas-bag, with high-speed initial fall, changing automatically to slow-speed descent for the safe landing. Parachute instantly released on landing, to avoid dragging the basket.

Variable-speed Parachutes, to permit a sudden high-speed drop, controlled by the Parachutist, to escape from an enemy aeroplane, and to stop on any portion of the grade of descent to avoid an objectionable landing. This variable-speed apparatus is applicable to the whole range of our Parachutes.

Non-spinning shock-absorber slings, taking all shocks off Parachute and man.

Aviator's Harness, distributing the stresses over those parts of the body best able to sustain them, and instantly releasable when alighting on land, on a roof, in a tree, or in water.

OUR EQUIPMENT IS THE RESULT OF ENGINEERING SCIENCE APPLIED TO DIFFICULT AIR PROBLEMS. WE BELIEVE THAT ITS EXTENDED USE WILL DOUBLE THE FLYING LIFE OF OUR FIGHTERS AT THE FRONT.

RELIABILITY—First. RELIABILITY—Second. RELIABILITY—ALL THE TIME.

How 2 tons of Steel were saved from the scrap heap.

The illustration below shows six hundred sliding shafts—the square at the driving end of each had become so worn by constant hard work as to render the shafts of no further use. Not so long ago they would have been described as worn out, and new ones procured. But to-day every scrap of chrome nickel steel is required for actual munitions, and the steel for the job, which had a fairly high priority classification, could not be obtained.

THE NEW WELDING CO.

were approached, and undertook the task of supplying the firm concerned with equivalent to six hundred new shafts, the difference being that no new steel was required and the expense was a fraction of what new shafts would have cost.

Each of the four sides of square was built up, and afterwards re-machined and case-hardened.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

A Method of Approximating the Static Thrust and Brake Horse-power of Air Propellers.

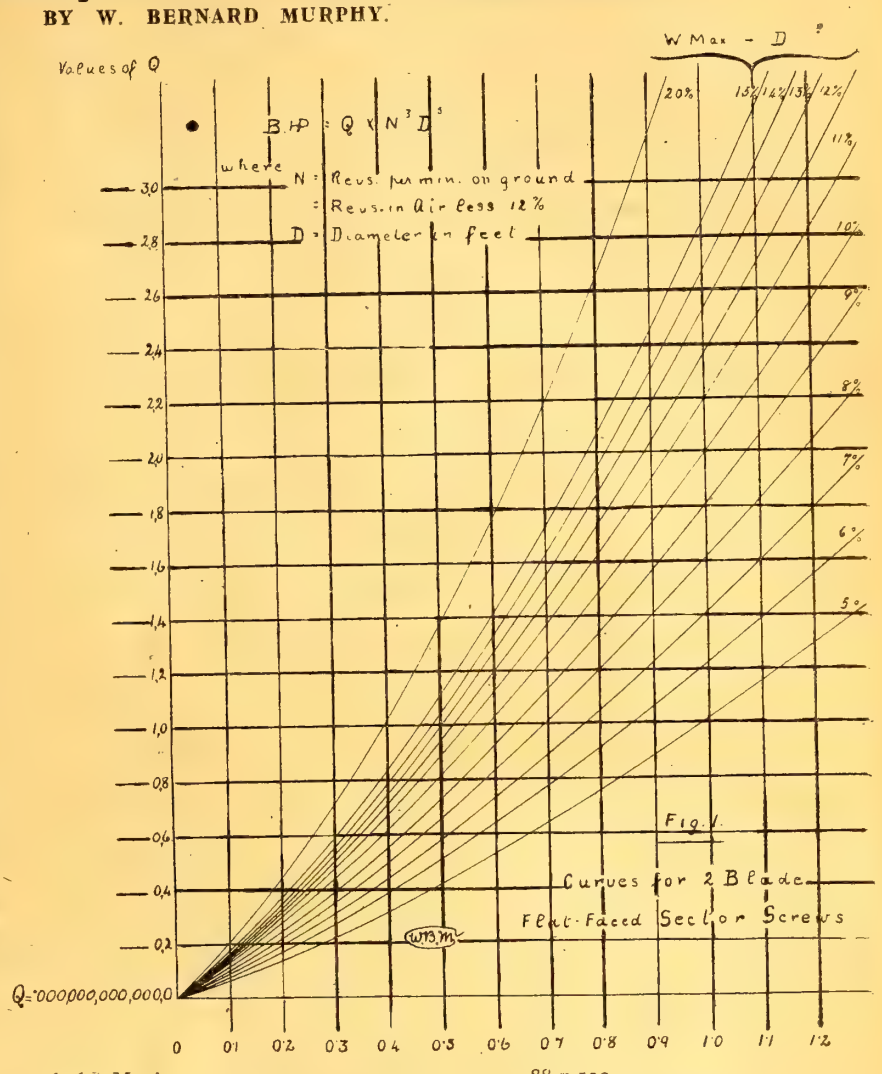
BY W. BERNARD MURPHY.

Since data as to methods of approximating static thrust of propellers are very meagre and as many people seem content with results that may be 20 per cent. from the actual figures, also ignoring the variable element of blade widths, a very important factor, a more suitable method is obviously necessary. Therefore I wish to call your readers' attention to the Laws of Airscrews discovered by W. R. Turnbull, A.F.Ae.S.

From these laws the Static Thrust and the Brake Horse-Power (on the ground) of any propeller can easily be determined within 5 per cent. of the actual values.

These laws were first published in the "Aeronautical Journal" of October, 1910, and were confirmed later by Riabouchinsky, Eiffel and others. They must not be confused with "Two Fundamental Laws of Aerodynamics," also discovered by Turnbull and published in the same journal in January, 1912.

Briefly stated, Turnbull's laws of airscrews are represented by the two formulæ :—



$$T = U\ R^2\ D^4.$$

and $$P = Q\ R^3\ D^5.$$

*in which T = Static Thrust in lbs.
P = B.H.P. (Absorbed by propeller revolving with no forward motion).
R = Revolutions per minute.
D = Diameter of the screw in feet.
p = Pitch of the screw in feet.

The co-efficients U and Q are variable, depending on the units employed and the relation of the Pitch (p) to the Diameter (D).

By using Turnbull's curves and substituting for the known quantities it is possible to determine quite accurately both the Static Thrust and the Horse-power absorbed. I reproduce the curves herewith so as to show how they may be applied to concrete cases.

It is assumed that the Brake Horse-power and the Maximum Revolutions per minute obtained in the air are known. Also, that the diameter, maximum blade-width and the ratio of the pitch to the diameter of the airscrew have been chosen. As the revolutions on the ground are always less than those obtained in the air by about 12 per cent. the necessary deduction must be made to obtain accurate results.

To take an actual example, let us assume that the engine to be used gives 100 B.H.P. at 1,250 revolutions per minute in the air. A maximum velocity of 100 m.p.h. is to be attained and the diameter of the airscrew is to be 9 feet.

With the use of the curves, Figs. 1 and 2, and the above-mentioned formulæ, the Static Thrust, and Maximum blade-width are first determined in the following manner :—

Maximum revolutions less 12 per cent. = 1,100 revs. per min. on ground.

From the B.H.P. curves supplied by the engine makers the brake horse-power delivered at 1,100 revs. per min. is obtained, we will assume it to be 93 B.H.P.

Substituting for the formula :—

$$P = Q \times 1100^3 \times 9^5$$

we obtain

$$93 = Q \times 1100^3 \times 9^5$$

from which

$$Q = 0.000,000,000,001,184.$$

We must now determine the ratio of p/D from the air-speed of the machine assumed in this case to be V = 100 m.p.h.

We can obtain this from the formula for pitch, viz. :—

$$p = \frac{88\ V}{R}$$

or in the case assumed $p = \frac{88 \times 100}{1250} = 7.05$ feet.†

$$\therefore\ p/D = \frac{7.05}{9} = 0.783.$$

We now have the ratio p/D and a value for Q, and if we enter the curves, Fig. 1, we find the maximum width (W. Max.) of a sector-screw to be 8.1 per cent. of the diameter, or 8.1 per cent. of 9 feet = 0.728 feet = 8.75 inches.

Having now determined our W. Max. for the conditions assumed, we can now turn to the curves on Fig. 2, and with this value and the value of p/D already found, find the corresponding value of U to be 0.000,000,059,5.

We may now by direct substitution in Formula 1 obtain the Static Thrust as follows :—

$$T \text{ in lbs.} = U \times R^2 \times D^4$$
$$= 0.000,000,059,5 \times 1100^2 \times 9^4$$
$$= 472 \text{ lbs.}$$

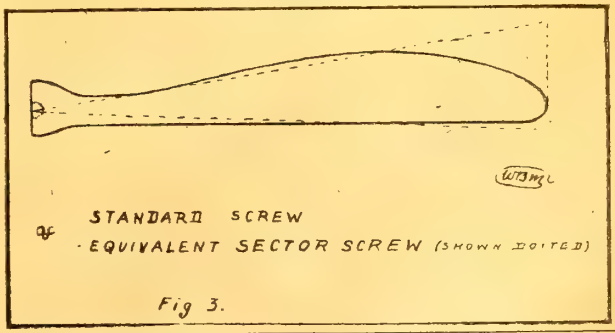


Fig. 3.

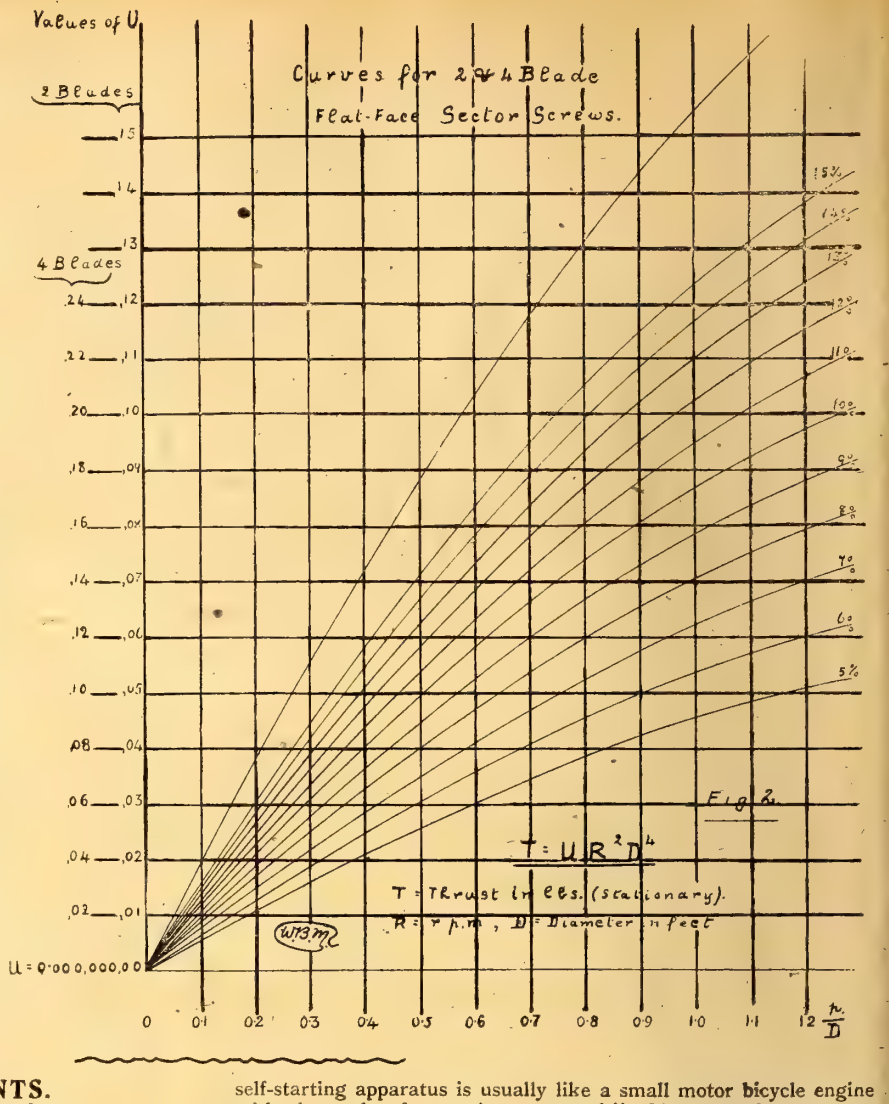
* These laws can be used with any units of time, weight, power, etc., not necessarily the English Units.

† This is the effective pitch, and for a strict consideration of the case the pitch due to the angle of attack must be added, but this is not necessary for approximate results.

This gives a close approximation for 2-bladed airscrews of sector shape having a flat face, but if it is desired to obtain a similar result for the more modern shaped screws, say, having a curved leading edge and a straight trailing edge, with the maximum blade width at about 2/3 radius of the screw, it is necessary to introduce some modifications as found by Turnbull from large-sized screws of this type.



For approximate results all that is necessary is to multiply the value of the maximum width (Sector Screw values) by 1.135.

In Fig. 3 is shown the difference between Sector Screws and Standard Screws. It will be noticed that the maximum width of the former is at the blade tips, while of the latter is at 2/3 of the radius. Insufficient attention has been paid to the fact that where a large horse-power has to be absorbed by an airscrew of restricted diameter the Sector Screw is the more useful. But where the diameter is not restricted the Standard Screw is more efficient, owing to the diminution of the blade-tip losses.

I have to thank Mr. Turnbull, the discoverer of these laws, for his kind permission to publish them. Unfortunately, many of the more modern designers, having at hand the latest aerofoil data and the results of numerous actual experiments, evolve their propellers by empirical formulæ which, in some cases, show little knowledge of the actual aerodynamics concerned.

It is to be regretted that the originator of these and the other laws mentioned does not republish his old works with the addition of his more modern data in a suitable volume, which would be of immense value to the many aeronautical engineers at present trying to obtain knowledge.

It will, of course, be remembered that the recent world's height record for seaplanes was established by the aid of a Turnbull propeller.

FOR DULL MOMENTS.

There has arrived at this office "for favour of review," a booklet, which describes itself as "A Glossary of Aeronautical Words and Phrases," apparently compiled by a Mr. H. J. Stevens. The frontispiece to this work is a more-or-less reproduction of a photograph of Sir William Weir, apparently at the age of about nineteen.

One notices in the table of contents that the name of the Albatros biplane is twice wrongly spelt, and that it is thereafter wrongly spelt in the pages to which the table of contents refers. On one of these pages the interesting statement is made that the Austrian-Hansa-Brandenburg is a development of the said Albatros. It would be interesting to know how this curious mongrel was produced, seeing that the Hansa firm is a definitely German firm, which has no alliance with the Albatros. One imagines that the perpetrator of this statement has been reading "All the World's Aircraft," and has misunderstood the statement that "the chief designer of Hansa and Brandenburgische Flugzeugwerke is Engineer Director Hunkel, formerly of the Albatros firm, who has brought out the 160 h.p. Mércèdes engined tractor biplane, on which the Austrian chief pilot of the company, Reiterer, put up various altitude record flights."

In various parts of the book there are illustrations and sketches of German aeroplanes and also of a few unimportant American machines, but it is interesting to notice that so far as this "glossary" is concerned not one single British aeroplane is so much as mentioned. In which connection it is really amusing to find a full-page advertisement of the publishers of the glossary themselves, in which they refer to one of their publications "as the journal that educates."

Turning to the actual "glossary," one finds among the more simple words that "Aerostatics" is "the science of equilibrium in the air." In plain fact, the equilibrium of aeroplanes in the air is distinctly a matter of aerodynamics.

One is also told that an "Airman" is "a person skilled in the control of aircraft." If this were true one imagines that the number of crashes in the Flying Services would be considerably less in number

Alongside "Air Pump" it is stated that "an air pump for self-starting apparatus is usually like a small motor bicycle engine with the cycle of operations reversed." If anyone has seen an air pump like this the Editor of The Aeroplane would be delighted to describe it at length.

After "Airships, British," one finds that "the 'Mayfly' was the first British attempt at a rigid airship. The types include 'Beta,' 'Gamma,' 'Delta,'" etc. It will be news to most people that these were rigid airships.

"Albatross" is given as "German seaplane named after the sea-bird albatross," and this despite the fact that the Albatros biplanes illustrated elsewhere in the book are all land machines.

'Aspect Ratio" is given as "the ratio of two dimensions (in any given aspect) of a flier." For instance, one supposes, the ratio of the hat band to the waist measurement of a pilot.

"Ballonet" is given as "a word taken from the French, meaning 'a little balloon,' and exclusively limited to an interior bag containing gas within the envelope of an airship." One is under the impression that the ballonet of most airships contains air, for the purpose of preserving the distention of the envelope.

"B.H.P." is given as "Brake horse power as taken off an engine or machine by a brake attached thereto. The instrument used is a friction dynamometer." One seems to have heard of calibrated fan-brakes and of water dynamometers.

"Box Girder" is described as "Girder in which plates are bolted together in box form, to give strength without great weight." Presumably, then, the cellule of a biplane or the fuselage of an aeroplane is not a box girder, though one confesses to being under the impression that it is so.

This only brings us to the letter C, and unfortunately it is impossible to review the rest of the alleged glossary. As a humorous work the publication is not without value. A number of drawings are included, taken from that excellent American paper, "Aircraft," but there is nothing to indicate that they are of American origin, and one is left with the impression that they are original drawings made for the publishers of the glossary itself. Those who wish to beguile a dull moment with the errors of the glossarist can obtain a copy for 1s. 3d. post free, from the Rolls House Publishing Co., Ltd., 2, Bream's Buildings, E.C.4, but one does not recommend that the publication should be taken seriously.

THE AIRCRAFT TRADER

Commercial Aviation—A Snag.

BY H. F. SMALMAN-SMITH.

In a recent interesting discourse Lt.-Col. Mervyn O'Gorman, in treating generally of conditions preliminary to the development of commercial air transport, suggests as a basis of international air traffic agreements between friendly Powers for the mutual concession of alighting rights and the laying down of fixed routes to be followed. In dealing with this branch of his subject, however, the speaker omitted any reference to a point which must certainly emerge into prominence in a manner impossible of neglect, i.e., the new facilities afforded by the development of aerial traffic for the introduction into this country of merchandise subject to import duties and the successful evasion of the latter.

The problem presented to the authorities in this connection is of primary importance not only by reason of the fact that its effectual solution is essential to the preservation of a vital source of national revenue, but further, that, unless adequately and seriously dealt with from the outset, *it may become the root cause of that official meddling and oppression* feared and deprecated by Lt.-Col. O'Gorman—a possibility which no one interested in the unfettered development of Aviation and the Aircraft Industry can disregard. A cursory examination of some aspects of the position may not therefore be found inopportune.

There are already abundant indications that with any return to a normal economic régime both the prime and running costs of aircraft will very rapidly be brought within limits calculated to give transport by air in the ordinary way of commerce a sufficient measure of advantage to warrant its adoption. Under such conditions it is obvious that the introduction of commodities moderate in weight and bulk and subject to heavy import duties will offer considerable attractions to unscrupulous adventurers whenever the profit likely to be earned is in any large measure in excess of running cost, and, failing the organisation of adequate means for the control of incoming aerial traffic, it is beyond all reasonable doubt that such a form of smuggling will become as popular as it may be lucrative.

It may be presumed that, following the conclusion of peace, the ban on civilian flying will remain until such international agreements as those foreshadowed by Lt.-Col. O'Gorman have been concluded. Their essential necessity as an initial step in the transition from military to commercial conditions is self-evident. It is equally clear, however, that the effective utility of such conventions, however wide their scope, must be restricted to assuring a certain legal status to aircraft passing from one country to another. They may in substance be extended to formulate a code, and enunciate penalties for its contravention, but apart from provisions of another character it is scarcely to be hoped that such agreements would exact a greater measure of respect from illicit profit-seekers than a scarecrow could command from hungry sparrows in a wheatfield

Assuming, therefore, that complete international agreements for the legalisation of air transport, code, penalties, and all have been brought into existence, and the high contracting parties, having legislated in due form against the international smuggler, the problem next arises, how is he to be kept out? The date and manner of his advent need be in no doubt. From the hour when a satisfactory margin of profit on his reprehensible enterprise becomes moderately assured he will be with us, and his tribe will be many.

That any preventive system devised against such an invasion can be entirely or immediately efficacious is scarcely probable. It must be recognised that the chances in favour of the modern "free-trader" will be great. Our special brand of weather will be his ally. And he will find in this country friends not a few. With a clear and timely recognition of the position, however, the creation of an approximately satisfactory working system to cope with the new traffic and its abuse *from its beginning* should be neither impracticable nor supremely difficult. Delay or half-hearted measures may, on the other hand, render it something like both.

In all previous revolutions in transport there has been a period of preparation, of gradual evolution during which surrounding circumstances have accommodated themselves little by little to the new factor without sudden change. It is a unique feature of the position in regard to air transport as the result of the present war, and the forced pace at which development of aircraft has proceeded under the spur of stern necessity and with unlimited capital backing, that with the return of peace the lineal successor to the railway, the bicycle, and the car, will come upon us full-grown. This circumstance renders it possible to achieve a tolerably accurate forecast of the characteristics and functions of the new traffic, the divergent lines of its early progress, the working towards permanence of certain varying types.

No great prophetic gift is thus needed to assume that in arriving at a practical solution of the problem presented two main classes of commercial aircraft will have to be considered, the first comprehending regular lines of large passenger carriers plying between fixed points, and the second including privately owned aircraft, or aerial tramps, finding their analogy in similar categories of our Mercantile Marine.

In regard to the former no great tax is likely to be made on the organising genius of our rulers. Fiscal requirements would probably be adequately met by the establishment of a Customs sub-centre at every regular point of arrival or departure, and the rendering it obligatory upon all air-liners to exhibit a special signal of entry disclosing their identity on passing the frontier, the carrying of certain lights at night, and by the closure of all but certain definite stretches of coast to the passage of this class of craft.

The question of dealing with the remaining category, comprising miscellaneous aircraft in commercial usage other than air liners travelling by fixed routes and time tables, presents greater difficulty, and must involve much heavier outlay. Nor would there appear to be any way of avoiding the establishment of an organisation based upon a thorough system of aerial patrols operating from stations at regular intervals all round our coasts, whose affair it will be to ensure the compulsory descent of all incoming craft other than regular liners at airports established at convenient points where the examination of cargo may be carried out and permits granted to proceed inland to destinations declared. It may be found necessary in time to supplement such a system by a second and interior line of patrols for the interception of aircraft which may have succeeded in slipping through the outer barrier.

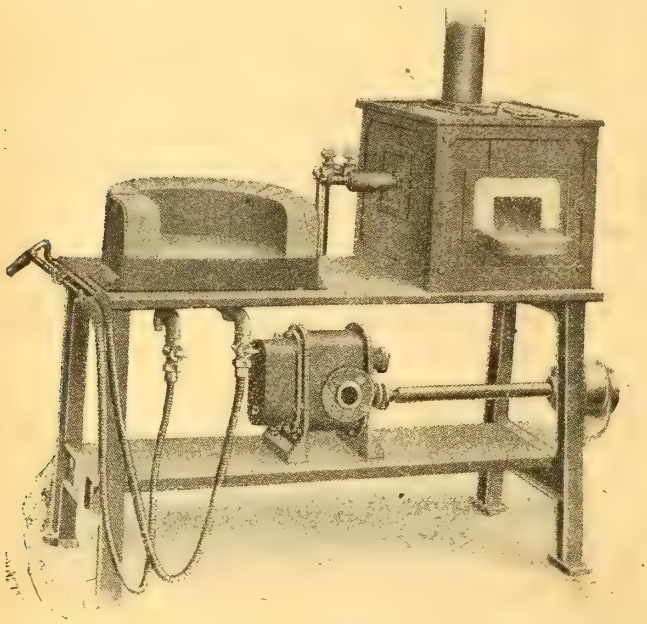
The employment of such types of aircraft as small airships, or, preferably, direct lift machines—should the latter have arrived at a sufficient state of development for their utilisation—in a capacity analogous to that of guard ships at seaports, will probably figure in linking up the work of the coastal patrols.

The writer, a few months since, urged in writing the case for the establishment of a comprehensive Government system of Air Halts based upon the industrial map throughout the country as a necessary preliminary to the establishment of commercial air transport on a serious footing. The existence of such an internal organisation would undoubtedly tend greatly to simplify the task in store for the purifiers of air traffic. Its natural complement would be found in the provision at intervals along our coast line of airports restricted to the use of water-borne aircraft as distinct from marine craft proper, with aerodromes for land machines attached, and under the direct control of the new coastal services. The creation of a sort of aerial Lloyd's Register of Aircraft, based upon which the arrival or departure of aircraft passing overseas may be wirelessed to the coastal organisation of countries within its orbit, and a proper check kept upon their activities, would follow in rational sequence.

Whether upon the lines thus roughly indicated or otherwise, the institution of some such system, complicated and costly as it may prove, may be regarded as inevitable, and no multiplication of international agreements will serve to bate one jot of its essential necessity. Nor does that necessity arise from fiscal considerations alone; for if it is absurd to suppose that the authorities would permit the whole Customs and Excise system of the country to be set at nought at the will of any commercial adventurer in search of untried paths to affluence, it is unthinkable that after the lessons of the present war foreign aircraft should be permitted to the freedom of our skies unchecked.

The writer claims no more for the suggestions put forward than that, superficially at all events, they would appear to meet

the more obvious and general necessities of the position, and if it be urged against them that the outlay entailed must run into figures not pleasing to contemplate, it may be laid down without reserve that whatever lines be followed, and whatever system devised, the cost can be no light one and must find its justification in such security as it may afford against loss of yet greater magnitude.



The only alternative from the purely fiscal point of view must seemingly be sought in such a remodelling of tariffs as would bring the main incidence of revenue duties upon commodities of too much weight or bulk for profitable transport by air; possibly also, in the devising of provisions touching the sale and make-up of light commodities, designed to render the placing of the smuggled article on its final market irksome and perilous to the transgressors. There is a certain cumbrousness about either suggestion.

The graver problem of protecting our national security from intruding foreign aircraft would, of course, remain.

FURNACES FOR AIRCRAFT WORK.

The attention of aircraft constructors is drawn to the different types of furnaces produced by the Davis Furnace Company, of the Diamond Foundry, Luton, Beds, who are in a position to supply all manner of heating appliances, especially crucible furnaces for metal melting, and more particularly oven furnaces for heating steel billets and plant for tool-making purposes.

The firm produces a distinctly neat tool-making outfit, containing a gas-heated oven, a D-shaped smith's hearth, a gas blow-pipe, and a blower which supplies air both to the oven and blow-pipe. This blower is of the rotary type, with extended shaft and fast and loose pulleys arranged for belt-drive.

The Davis Furnace, combining smith's hearth, furnace, blow-pipe and blower.

Those interested are recommended to get in touch with The Davis Stove Company, Ltd., at Luton, or at 15, Rathbone Place, London, W.1.

A CHANGE OF ADDRESS.

Hays, Hunter and Standen, Ltd., of London and Wolverhampton, whose name is well known in connection with "Don" Brake Lining and other specialities, are among the people who look ahead. Finding their business increasing in all directions, and in anticipation of further developments after the war, they are on March 31st moving their head offices and warehouse to 71, Southwark Street, S.E.1, which from that date onwards will be their London address.

THE MASS OF OFFICIALDOM.

An engineering correspondent of the "Morning Post," writing recently of the troubles of manufacturers owing to the mass of officials now employed, remarked:—

Later accretions to this unwholesome mass are the Recruitments Complaints Committees, the Munition Areas Recruiting Officers, the Munition Areas Dilution Officers, and some battalions of supervisors and directors, whose exact functions are not defined. Expressed in workshop vernacular, their duty appears to be to "mess about" generally.

Thousands of Labour Exchange, War Office, Admiralty, and Board of Trade officials are mixed up with this hotchpotch. No precise particulars are given to us, but my own calculation is that over 350,000 adult persons are occupied in the noble work of organising the engineering trades into impotency and confusion.

Let there be no illusion about this business. No industry can produce under this crushing and demoralising burden. Apart from the non-producing officialism of the workshops, much of which is clearly essential, every seven workers have to carry the weight of a salaried or feed State official.

If this official irruption is really inseparable from State Socialism and national control of industry it must force many of us to revise our ideals. If this mass of incapacity were merely useless it might still be barely tolerable, but it is an infinite mischief. It has shrivelled the energies and destroyed the enthusiasm of men and master alike.

Employers in the writer's circle of acquaintance say that it is no use trying. Every day brings some silly, peddling order from some official quarter, they are no longer masters in their own establishments, and if the superior young gentlemen of the Ministry know more about it than practised tradesmen let them go ahead.

The industry so essential to the national aim and inspiration needs a sharp stimulant, but its path of effort must be cleared of the obstacle of amateur direction and misgovernment. I have stated in these columns before that we are not producing adequately or securely. It is a hard thing to say, but the issues at stake are serious.

The industries cannot be organised by relays of State-paid meddlers or by clerical formalists with boxes of index cards. They will do their work and do it well if they are given the liberty that is the first need of efficiency. We must lose some scores of thousands of departmental officials or lose the war.

[And yet we are told that we want more air offices.—Ed.]

FORMS FOR FORMS' SAKE: OR, WHY THERE IS A PAPER FAMINE.

(Dedicated to the teeming thousands housed in various palatial hotels in London and elsewhere.)

Oh, we love a little work,
But we're gluttons for red tape;
So we issue tons of forms,
Of every size and shape.
Forms that make men wild,
None to keep 'em calm;
So another little form
Won't do 'em any harm.

Chorus:— Another little form,
Another little form,
Another little form,
Won't do 'em any harm.

Forms of gorgeous red,
Forms of navy blue,
Forms of snowy white,
Forms of bilious hue;
Forms which cause distraction;
None that soothe like balm;
So another little form
Won't do 'em any harm.

Forms to keep their cash,
Forms to make 'em pay,
Forms to push production,
Forms that cause delay.
Forms for work that's done,
Forms that spread alarm;
So another little form
Won't do 'em any harm.

Forms for forms returned,
Forms for forms retained;
Forms for forms unused,
Forms that fog the brain;
Forms entirely useless,
Forms that these embalm;
So another little form
Won't do 'em any harm.

Forms for payments made,
Forms for cash to come,
Forms for goods delayed,
Until we smash the Hun.
Forms for forms unissued,
Never cause a qualm;
So another little form
Won't do 'em any harm.

Forms for orders sent,
Forms for those to come;
Forms for bills received,
Forms ad nauseam;
Forms to sing a hymn,
Or even chant a psalm;
So another little form
Won't do 'em any harm.

AIRCRAFT FINANCE

THE WHITEHEAD AIRCRAFT PROSPECTUS.

The inquiries received concerning this issue show that the comments made in these columns have aroused a certain feeling of caution on the part of many investors interested in Aircraft finance. One correspondent in particular asks the following very pertinent question: "What is the justification for demanding a premium on the shares issued?"

An examination of the prospectus shows that the Company is under obligation to meet the following annual standing charges:

	Per annum.
1. The First Mortgage Debenture of £150,000 at 6½ per cent. interest requires	£9,750
2. Redemption of these Debentures is contemplated over 15 years at a premium of 2½ per cent. requires (by effluxion the amount payable each year for interest would naturally be reduced)	£10,250
3. There has been issued, or agreed to be issued as fully paid up, as part of the purchase consideration, £100,000 Second Mortgage Debenture. No rate of interest mentioned, but we may assume it is not less than 7½ per cent. This requires	£7,500
4. The 300,000 7 per cent Preference Shares require	£21,000
Being tax free up to 5s. in the £ will require an additional	£7,000
5. The 650,000 10 per cent. Ordinary Shares will require	£65,000
The annual amount required to cover the fixed charges is therefore	£120,500
6. Mr. Whitehead is entitled to receive as remuneration £3,000 per annum. Each of the Six Directors is entitled to £500 per annum	
The Debenture trust deed gives the Trustees power to nominate two additional Directors (no mention of the names or number or remuneration of these Trustees is made in the prospectus), but in view of the fact that special powers are taken to pay to each Director all their travelling and other expenses, and their travelling and other expenses incurred in attending Board meetings, I think I shall be well within the mark if I set down the item of Directors' fees, Trustees' remuneration and Directors' expenses at	£10,000
7. Provision must then be made for the legal representative, Secretarial staff, and Auditors' fees, administration, and office expenses, printing advertising, etc., say, modestly	£10,000
8. Depreciation on the purchase consideration of £510,000, say, one half (the properties) at 5 per cent.	£12,750
And the other half (machinery and plant) at 10 per cent.	£25,500

The Company would therefore require £178,750 per annum to meet its standing charges, pay its Directors' fees and administration expenses, general expenses, and provide for depreciation.

To meet this amount the prospectus states that "the Auditors certify the profits to June 30th, 1917, to be at the rate of £23,966 per annum *before charging Interest on Loans, Mortgages and Debentures, Income and Excess Profits Duty.*"

It would be interesting to know what the actual *divisible* profit really is, that is, after deducting these liabilities for the reason that Mr. Whitehead in the prospectus states: "The present turnover is at the rate of nearly six times the rate per annum of the turnover during the 15 months ended June 30th, 1917," inferring that the profit will be sixfold.

I contend that if the proper charges for Interest on Loans, Mortgages and Debentures had been deducted, and provision made for Income Tax and Excess Profits Duty, very little of this already comparatively insignificant profit would have been left for the auditors to certify.

It is clear that the Company will require at least to make an annual trading profit of close upon £200,000 to pay its way, if one takes into consideration Income Tax alone, without considering Excess Profits Duty. Consequently, I reply to my correspondent that there is no possible justification for demanding a premium on the issue, and I go further and declare that there is nothing in the whole prospectus that even justifies the capitalisation at par, or the enormous purchase consideration payable by the Company to Mr. Whitehead. Last week in these columns it was shown that the issue, if wholly subscribed, would secure from the public £508,750, and after the cash payments to Mr. Whitehead and the redemption of the mortgage held by the Government would only leave £54,240 in the coffers of the Company.

It has since been pointed out by another correspondent that even this comparatively small amount would appear to be inexact, and it is liable according to the prospectus to be still further reduced. For the reason (1) that in addition to the large amount payable by this Company to Mr. Whitehead as purchase consideration this Company is liable *to pay all the liabilities of the old Company* (2).

This Company is further liable to pay all the legal charges and stamp duties on the transfer of the properties (3).

The Company has to pay the Brokers' fees and brokerage at 3d. per share (4) and over and above the 2s. 6d. per share payable to Mr. Whitehead as commission the prospectus clearly states that "the preliminary expenses, exclusive of *underwriting* and brokerage, are estimated at £20,000."

Endeavours are being made to ascertain exactly what this means.

The amount of Working Capital remaining available to the Company is of great importance, as it is (1) the only reason for a public issue and should not be permitted in these times for the benefit of any company promoter; (2) to show what justification it represents for the payment of £111,000 to Mr. Whitehead; and (3) because the prospectus refers to the earning capacity of the new capital (?).

The more one examines the details of this company promotion the more one marvels at the want of perception on the part of the Treasury officials.

There is comfort, however, in the knowledge that the investing public may rely upon the Stock Exchange Committee. They are not likely to be misled into granting a "settlement."

The new Issues Committee of the Treasury have been guilty of some stupid blunders in the past, but of nothing so glaringly absurd as to have permitted this Whitehead Aircraft prospectus to be publicly issued with Treasury consent. When will the Committee deign to consult men who know?

COMPANIES' PROCEEDINGS.

NEW COMPANIES.

Adastral, Ltd.—Private Company. Registered March 19th. Capital, £5,000, in 4,500 shares of £1 each, and 10,000 shares of 1s. each. To acquire from F. J. La Roche the trade mark, 375,007 "Adastral," and to carry on the business of aeronautical and general engineers, manufacturers of and dealers in metal aircraft components and metal parts for ordnance, shipbuilding, railway, or other engines, motor-cars, and vehicles, etc. The subscribers (each with one ordinary share) are:—F. J. La Roche, 1, Stanley Gardens, Hampstead, N.W., aeronautical engineer; P. C. Edmunds, 20, Wardour Street, W., licensed victualler. The first directors are:—F. J. La Roche (French) and P. G. Edmunds (English). Qualification, £100. Remuneration £50 per annum each (£100 for the chairman). Registered office: 1, Stanley Gardens, Hampstead, N.W.

Worms Aircraft Construction Co., Ltd.—Private Company. Registered March 22nd. Capital, £20,000 in £1 shares (5,000 pref.). To take over from M. Worms the business of manufacturer and designer of aircraft and aircraft parts and accessories, carriage builder and shipbuilder, carried on by him as the "Worms Aircraft Construction Co.," to establish and maintain lines of aerial, road motor, sea, river and canal boat services, etc.

The subscribers (each with one share) are:—M. Worms, Rutland Works, Bournemouth, aircraft manufacturer; F. Wright, 8, Stanley Mansions, Upper Tooting, secretary First directors are:—M. Worms (managing director), F. Wright, L. G. Worms, R. E. Jones, and A. Barnes. Solicitor: G. W. Cook, 70, Finsbury Pavement, E.C.

British Cellulose and Chemical Manufacturing (Parent) Co., Ltd.—Private Company. Registered March 30th. Capital, £3,500,000 in £1 shares. To acquire, hold and dispose of stocks, shares, debentures, debenture stock and obligations of the British Cellulose and Chemical Manufacturing Co., Ltd., or any other company, and to carry on the business of manufacturers, producers, importers, exporters and brokers of and

wholesale and retail dealers in chemicals, drugs, paint, varnish, dyestuffs and pharmaceutical preparations, motor-car, motor-boat, submarine and aircraft manufacturers, engineers, explosive manufacturers, etc.; also the business of an electric light and power company, etc. The first directors are:—Lt.-Col. W. G. Morden, Commander Sir A. Trevor Dawson, R.N., Sir Lionel Phillips, Bt., Sir Mitchell Mitchell-Thomson, Bart., H. McGowan, Dr. Camille Dreyfus, Dr. Hy. Dreyfus, A. Clavel and A. B. B. de Tscharner. Qualification (except first directors, who require none), £1. Remunerations, £50 each per annum, and £50 extra for the chairman. Solicitors: Grundy, Hershaw, Samson and Co., 5, Austin Friars, E.C. No notice of situation of registered office was filed with original papers.

The National Metal and Chemical Bank, Ltd.—Private Company. Capital of £1,000,000 in £10 shares, to carry on in the United Kingdom and any part of the world banking in all its branches; also to prospect and work properties, mines, and rights, and to carry on business as metal dealers, brokers, and general merchants, agents, and brokers, consulting engineers, assayers, etc. Power is taken to establish, maintain, and work lines of aerial conveyances.

Flight Motor Co.—March 1st, by Jordan and Sons, Ltd., 116-117, Chancery Lane, W.C. £250 (£1). Private. (149,752.)

Springthorpe, Ltd.—Private Company. Registered Jan. 16th. Capital, £2,000 in £1 shares. To take over the business of an engineer carried on by W. H. Springthorpe, at 135, Devonshire Street, Winson Green, Birmingham; also to carry on the business of manufacturers of and dealers in tension screws and nuts for aircraft, screws, bolt-nuts, box tools, for capstan lathes, aircraft components, motor accessories, etc. The subscribers (each with one share) are:—J. Vann, 33, Wretham Road, Handsworth, Birmingham (manufacturer); A. Vann, 2, Villa Road, Handsworth, Birmingham (manufacturer); W. J. Davis, 18, Ashfield Road, Kings Heath, Birmingham (manufacturer); W. H. Springthorpe, 48, Benson Road, Soho, Birmingham (engineer). Table "A" mainly applies. Registered office: 35, Devonshire Street, Winson Green, Birmingham.

DECLARATIONS OF DIVIDEND.

Sunbeam Motor Car Company.—An interim dividend of 5 per cent., free of tax, on the ordinary shares, payable 15th prox.

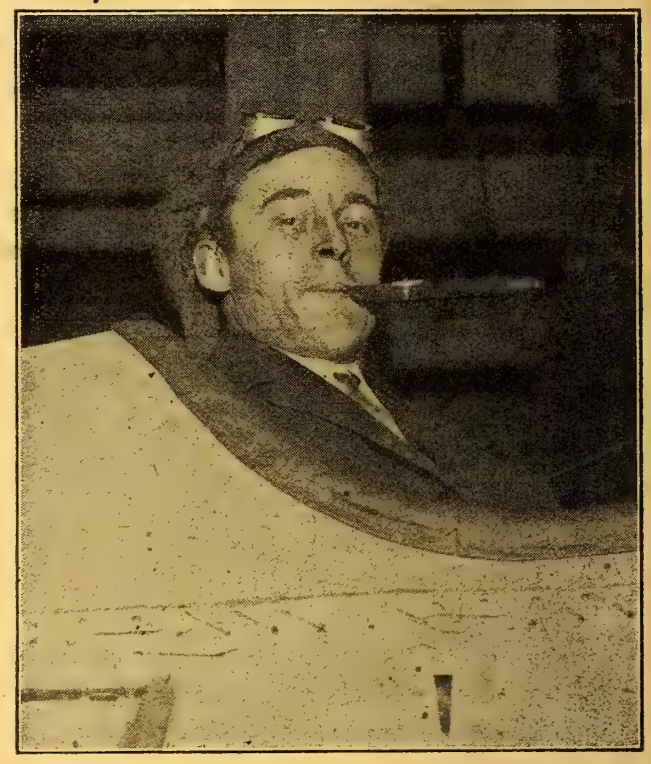
The Birmingham Small Arms Company has declared the following interim dividends for half-year ended 31st January:—On the "A" Preference shares at the rate of 5 per cent., less tax; on the "B" Preference shares at the rate of 6 per cent., less tax; on the Ordinary shares at the rate of 5 per cent., free of tax—all payable 2nd April.

AN EXPLANATION.

One gladly publishes the following note of explanation received from the "Nieuport" and General Aircraft Company, Ltd.:—

Owing to a notice which has recently appeared in the Press with regard to the voluntary winding up of Nieuport (England), Ltd., a false impression has arisen that it is this company which is being wound up. I shall be greatly obliged if you will correct this impression in your next issue.

The business of Nieuport (England), Ltd., was taken over by this company some twelve months ago, and as it had no *raison d'être* to remain in existence it was consequently liquidated. J. W. Thomson, Secretary.



WHITEHEAD AIRCRAFT.

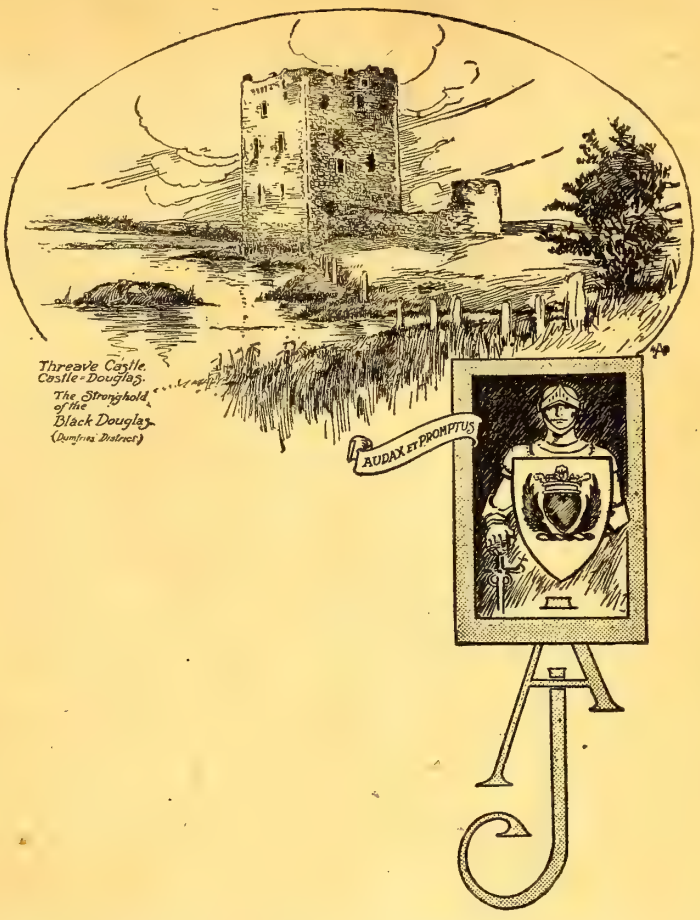
The attention of readers is particularly directed to the anaylsis of the Whitehead prospectus which is published under "Aircraft Finance" in this issue. Many people have asked for advice as to investing in this firm. One can only say that it is not an investment which one would recommend to one's friends. The "Financial Times" remarks that it is highly speculative. That is about the kindest thing one can say about it.

Various readers have asked why this paper accepts the Whitehead advertisements and then criticises the flotation adversely. The answer is very simply that anybody can buy advertisement space if they like to pay for it, and Whitehead money is as good as any other. The only excuse for refusing an advertisement, so long as the space is there to sell, is either that it is indecent or libellous. The Whitehead advertisement fails to achieve either distinction.

If the Advertising Manager of The Aeroplane refused to sell his space to the Whitehead Company and the firm's financial activities were then criticised in the editorial columns, one would then be open to the charge of slating the firm because it did not advertise—a charge similar to that made by Mr. "Owen John" in the "Autocar" against the present writer when he slated Coventry. At any rate, the acceptance of the Whitehead advertisements shows an absolutely open mind. Perhaps the Whitehead firm would now like to withdraw them.

Many readers have asked "What manner of man is this Whitehead who is so prominently before the world at the moment?" One feels that such curiosity is natural, therefore one takes the liberty of publishing a couple of typical photographs of Mr. Whitehead, in the hope that they may be at once entertaining and educative. It may be as well to state that the photographs were received from Mr. Whitehead himself, so one is justified in assuming that he is satisfied that they are sufficiently good likenesses.—C. G. G.

Mr. Whitehead's Pride in His Early Efforts.



MR. WHITEHEAD'S BUSY DAY.— He is here seen having his breakfast, shaving, receiving a telephone message, making notes, dictating a letter, and accepting a telegram, all at once. One assumes that in spite of the picture Mr. Whitehead does not profess to be a Jack-of-All Trades.

THE whole Arrol-Johnston plant is being used in the manufacture of Aero Engines, but ——

THE ADVENT OF PEACE

will see the production of an Arrol-Johnston Car which will further enhance the great reputation the A.-J. Car already enjoys.

MADE IN ENGLAND.

Illustrated Catalogue on Application.

THE LODGE SPARKING PLUG CO., LTD., RUGBY.

(*Continued from page 1242.*)

DEALY.—Lt. Thomas Sydney Ough Dealy, A.F.C., killed while flying on March 7th, was born in Hong Kong in 1896, and educated at Stonyhurst College, Lancashire. After leaving he went to Roseworthy Agricultural College, South Australia, where he obtained his first-class diploma in Agricultural Science and Veterinary Science, as well as the special medal for the latter. At Stonyhurst he became vice-captain of the school and of the football team. He also played for the college cricket eleven in two successive years. He was a good all-round athlete and an excellent exponent of boxing, golf, and tennis. When at Roseworthy he won the Old Students' Cup.

DEMPSTER.—Sec. Lt. Ian Mackay Dempster, R.F.C., who was killed on Feb. 24th after a fight in the air, was the youngest son of the late Mr. J. P. Dempster, J.P. for Western Australia, and Mrs. Dempster (née Patton, of Glenalmond), St. Ives, Cornwall. He was 20 years of age and was an observer in the R.F.C.

DOYLE.—Lt. M. W. Doyle, aged 25, was flying near Shenley, Hertfordshire, on March 23rd, when his machine fell 300ft. and he was killed. Mr. Doyle was 25 years of age.

EDWARDS.—Serjt. Stanley Edwards, R.F.C., was killed at Brooklands aerodrome on March 18th through the fall of his machine after looping the loop.

ERSKINE.—Capt. Ralph Erskine, R.F.C., who was reported missing on January 1st last, is now unofficially reported as having been killed in an air battle on that date. He was the younger son of Capt. James Erskine, Gordon Highlanders, and brother of Capt. T. Barrie Erskine, M.C., Gordon Highlanders, who was killed in France in 1915. He was educated at Allen Glen's, Glasgow. When war broke out he was a medical student at Glasgow University, and immediately joined up. He was given a commission in the Royal Scots Fusiliers, and saw some heavy fighting in France, being captain in that regiment at the battle of Loos. He afterwards joined the R.F.C., and served for a considerable time as an observer in France, where he was wounded, and mentioned in dispatches. After getting his "wings," he returned to France, and was sent from there to another front, where he was first British aviator to fall. He was a noted athlete, and represented Scotland in international long-distance races. He won the Public Schools Boxing Championship, and the amateur featherweight championship of the world. He married in March, 1917, Lennie, only daughter of Mr. and Mrs. W. Higgins, of Wimbledon, who, with an infant son, survives him.

FEAR.—Sec. Lt. Robert S. Fear, Worc. R., attd. R.F.C., who recently died of wounds, was son of the late William Henry Fear, of Walstanston. He was educated at Highfields School, and intended entering one of the universities, but when only 18 years of age he joined the Artists Rifles. He received his commission last September, and, subsequently transferring to the R.F.C., was wounded while flying on artillery reconnaissance.

FIELD.—Capt. Archibald William Field, R.F.C., who was reported "missing" on Jan. 9th, is now unofficially reported as having been killed in action on that date. He was third son of Mr. Edward Field, Clerk of the Peace for Warwickshire, and of Mrs. Field, of Blackdown Hill, Leamington. He was educated at Orwell House, Felixstowe, and at Rugby. At the outbreak of war he was in Vancouver Island, but immediately returned home, enlisted in the Shropshire Yeomanry, was granted a commission in the R.N.V.R. on Sept. 17th, 1914, and went abroad with the armoured cars on Oct. 2nd. He was in Antwerp during the siege, and saw much of the fighting throughout Flanders, including the first battle of Ypres and the battle of Loos, first with the armoured cars, and later, when he exchanged into the Army as a captain in the R.F.C. He was wounded in aerial combat on Sept. 25th, 1916, and, returning home, he took his pilot's certificate, and again went abroad on Sept. 27th, 1917.

GAMON.—Capt. S. P. Gamon, Cheshire Regt. and R.F.C., was the eldest son of Mr. and Mrs. J. P. Gamon, of Leighton Banastre, Parkgate, Cheshire, and was 23 years old. He was educated at St. Fillan's Heswall, The Leas, Hoylake, and Uppingham School. An application for entrance into the R.N.A.S. which he made in August, 1914, was refused, as he then held a commission in a Territorial Force as officer commanding the machine-gun section. This section was chiefly manned by men from the Chester Hydraulic Engineering Company, with whom he was completing a course of engineering, and he went to the front with his regiment in February, 1915, remaining with them there till May, 1916, and having during that time gained the permanent rank of captain. He then obtained leave to join the R.F.C., and was acting an observer in France from May to November, 1916, when he returned to England to take his pilot's course. Obtaining his wings early in 1917, he had since been engaged in the aerial defence of London.

A verdict of "Accidental Death" was returned at the inquest on March 25th, when it was stated that his machine fell into the grounds of a private house about half a mile from an Essex aerodrome where he was stationed. Capt. Gamon was 23 years of age.

GOPSILL.—Capt. Kenneth Lloyd Gopsill, East Surrey Regt., attd. R.F.C., second son of Mr. and Mrs. T. F. L. Gopsill, of Cheam, Surrey, was born at Handsworth, Staffordshire, in 1897, and educated at King Edward's School, Aston, Birmingham, and Alleyn's School, Dulwich. He was apprenticed to Tangyes, Soho, and was studying for matriculation at the Birmingham University when the war broke out. He enlisted in the 14th Royal Warwick Regt. on Sept. 17th, 1914, a few days before his 17th birthday, and served six months. In March, 1915, he was gazetted to the East Surrey Regt., and in Jan., 1916, was attached to the R.F.C. He served seven months in France with a fighting squadron, and returned home on Dec. 15th, 1916, being employed on the staff of the Central Flying School, Upavon. He was gazetted lieutenant on Sept. 5th, 1916, and temp. captain and flight commander on Mar. 1st, 1917, and returned to the front as flight commander in May, 1917. He was wounded on July 12th, 1917, and was appointed assistant instructor in England last November. He went to the front again on Feb. 12th last, and was killed in a flying accident on Feb. 15th.

GOSS.—Mr. Leonard Sidney Goss, R.F.C., who was reported on Sept. 19th, 1917, is now officially reported killed on that date. He was the only son of the late Sidney F. Goss and Mrs. Goss, of 81, Deodar Road, Putney, and the grandson of the late Capt. Henry Hunt Avon. Mr. Goss, who had seen active service in France for over three years, was acting as an observer in the R.F.C. at the time of his death.

GREGORY.—Capt. John Sheridan Gregory, R.F.C., formerly A.S.C., reported killed on the Western front, was educated under Mr. George Egerton, of Somerset Street, and at Westminster School. Thence he entered Trinity College, Cambridge, and took up Law. He graduated in 1911, having passed Law Tripos, Parts I. and II., and obtained his degrees of B.A., and LL.B. He then entered the Middle Temple. In Aug., 1914, he had passed all the Bar examinations except the final. He enlisted in the O.T.C. (Army Service Branch) two years before the war, and by Aug., 1914, he had qualified for and received Certificate A. In 1914 he at once joined the A.S.C. as second lieutenant. In 1917 he was attached to the R.F.C. as an observer, and was preparing to train as a pilot. A fortnight before his death he received the 1914 Star for his past services in France. Capt. Gregory was the younger son of Lieut.-Col. G. M. Gregory, V.D., and of Mrs. Gregory, of Gunterstone Road, West Kensington, and was 28 years of age.

GUEST-SCOTT.—Capt. Maurice Douglas Guest-Scott, M.C., R.F.C., who died on March 17th in Sussex as the result of a flying accident, was the only surviving child of the late Philip Guest-Scott, District Engineer, E.I.R., India, and of Mrs. Guest-Scott. He was 22 years of age.

HUDSON.—Capt. F. R. Hudson, R.F.C., son of the Rev. A. R. Hudson, rector of Huntsham, Devon, who was killed while flying at night on March 21st, was educated at St. Edward's School, Oxford. He joined the R.F.C. in October, 1915, and served in France from October, 1916, to May, 1917, when he was wounded, and had since been flying in England, obtaining his flight at the beginning of this year. He was 27 years of age.

HUGHES.—Lt. Thomas McKenny Hughes, K.R.R.C., attd. R.F.C., killed during February while flying abroad, was a prominent London Rowing Club oarsman. The son of the late Professor Hughes, F.R.S., he was educated at Eton and Trinity College, Cambridge. Early in the war he secured his commission in the K.R.R.C., but transferred to the R.F.C. early in 1917, and was engaged on special duties at the front when he met his death. He joined the London Rowing Club after leaving Cambridge, and was one of its most successful oarsmen during the three seasons immediately preceding the war. In 1912 he stroked the London eight for the Grand and the four for the Wyfold at Henley Regatta, the four winning two heats before losing the final to Queens', Cambridge, after a very hard race. The same crew afterwards won at the Metropolitan, Kingston, and Molesey Regattas. In 1913 he rowed "3" in the London eight for the Grand, and stroked the Wyfold four. At the last Henley before the war he rowed bow in the Grand and Wyfold crews. London won the latter event, defeating Magdalen, Oxford, Nottingham (Union), and Lady Margaret, Cambridge. In the season before the war Mr. Hughes took up sculling with success, winning the juniors at Molesey Regatta, and taking the junior-senior sculls at Kingston Regatta a week later.

IKIN.—Sec. Lt. A. E. Ikin, R.F.C., was killed while flying in France on May 11th. He was the eldest son of Dr. A. E. Ikin, Director of Education at Blackpool, was 19 years of age, and was educated at Hereford Grammar School, and later at Norwich, and gave considerable promise in science and mathematics. He gained honours in the Cambridge Locals when he was only 14.

and passed the London Intermediate Science Examination at 17. During his last year at school he won a Board of Education Exhibition of £50 a year at Cambridge, and also an open scholarship at Clare College. For two months before going to France Mr. Ikin had been engaged in night flying against enemy air raiders; but more recently he had taken part in night bombing over the enemy lines and on other special flight work.

KANN.—Lt. E. H. Kann, R.F.C., who was previously reported missing on Oct. 21st, 1917, and is now reported killed, was 21 years of age and the eldest son of Mr. and Mrs. René Kann, of Lancaster Gate. He had his commission in the Loyal North Lancashire Regt. in Oct., 1914, and transferring to the R.F.C., was given his "wings" in July, 1916.

KYNOCH.—Capt. Alexander Bruce Kynoch, R.F.C., who was killed in England as the result of an aeroplane accident on March 8th, aged 25, had seen service in Egypt, the Dardanelles, where he was wounded, and Macedonia. He originally served with the Duke of Wellington's Regiment, but later transferred to the R.F.C., and in October came to England to learn to fly. Within six weeks he had graduated, and he showed promise of becoming a skilled and efficient pilot.

LEY.—Capt. Christopher Francis Aden Ley, Yeomanry, attd. R.F.C., whose death was reported recently, was the second son of the late Sir Francis Ley, Bt., and was 24 years of age. He was educated at Pelham House, Folkestone, Malvern College, where he served both as house and college prefect and as sergeant in the O.T.C., and at Pembroke College, Cambridge. He took a keen interest in all games and sports, and was an excellent shot, being a member of the Malvern College VIII., and shooting at Bisley in 1911 and 1912. He also formed one of the team of four which won the Veterans' Trophy for Malvern at Bisley in 1913. He was appointed to a seat on the Board of Conservators for the Yorkshire Esk on the death of his father in 1916. Captain Ley received his commission in the Yeomanry in Sept., 1914, reaching the rank of captain in June, 1916, served in Gallipoli from August to November, 1915, and there contracted typhoid fever, and in consequence spent several months in hospital. He then joined the Royal Flying Corps, and was given his wings in May, 1917, and was wounded in an aerial fight in France last June. He had just been passed as fit for service, and was on the point of returning to the front.

A verdict of accidental death was returned at the inquest at Croydon on March 18th. Evidence showed that he crashed into a house near Croydon Town Hall, and was killed. Deceased was not one of the aviators scattering leaflets around the Tank, but was engaged on ordinary flying practice.

A police-inspector stated that deceased nearly collided with the Town Hall tower, which is only 170 ft. high, and then he ascended to over 1,000 ft. He nose-dived again, and failed to clear the houses.

An officer stated that deceased apparently misjudged the available air room for recovering from the dive.

LEWIS.—Lt. F. A. Lewis, R.F.C., was killed near Montrose on March 29th by his machine "nose-diving" to earth. He was a native of California, and was 23 years of age.

LUMLEY.—Henry Ralph Lumley, late Sec. Lt. R.F.C., who died on March 11th at the Queen's Hospital, Sidcup, Kent, was the youngest son of the late Ralph Robert Lumley and of Florence Lumley. He was 25 years of age.

MANLEY—MONTGOMERY.—An inquest was held on March 8th, on the bodies of Lt. Manley, R.F.C., and Lt. Montgomery, American Aviation Section. During a flight in formation which Mr. Manley was leading his machine fell in flames, bringing down Lt. Montgomery's machine in its fall. A verdict of accidental death was returned.

[Here, again, is a case where a properly arranged parachute would have saved one, if not two, lives. How much longer is this simple means of saving life to be delayed in its development?—Ed.]

Terence Wood Manley, R.F.C., was the only surviving son of Herbert Manley, M.D., Barrister-at-Law, of West Bromwich, Staffordshire.

MEREDITH.—Sec. Lt. Owen Watkin Wynn Hardinge Meredith, R.F.C., who was killed in action on Nov. 20th, 1917, was only child of the late the Venerable Thomas Meredith, vicar of Wolston and Archdeacon of Singapore, and of Mrs. Meredith, of Park Road, Leamington. He received his "wings" in July, 1917.

MESSERVY.—Capt. Ernest Dyce Messervy, London Regt., attd. R.F.C., who was reported missing on July 20th, 1917, is now believed to have been killed on that date. He was youngest son of the late Ernest and Dyce Messervy, of Telawakelle, Ceylon, and the nephew of Mrs. Thorne, of Highfield Park, Heckfield. Capt. Messervy was 23 years of age, and had his captaincy in the London Regiment on June 1st, 1916; his appointment as flying officer was dated February 28th, 1916.

MIDDLETON.—Lt. G. N. Middleton, R.F.C., belonging to South Africa, was killed while flying near Montrose on Feb. 21st.

MOORE.—Sec. Lt. Charles Ronald Moore, R.F.C., who was killed on March 8th, was the eldest son of Mr. and Mrs. Charles E. Moore, late of Worcester. He was born on May 8th, 1899, and educated at Trinity College, Glenalmond. He was appointed to the R.F.C. as a cadet in April, 1917, was gazetted Sec. Lt. in the September following, and obtained his pilot's wings in January of this year. He volunteered for service overseas in February, 1918, and was appointed to a squadron of the R.F.C. in France, where he was killed two months before attaining his nineteenth year.

MORRIS.—Lt. John Herbert Morris, R.H.A., attd. R.F.C., who was killed in action on March 6th, was the younger son of Capt. and Mrs. Alfred Morris, late of Langton, Blandford. He was nineteen years of age, and had his commission in the Royal Artillery in October, 1915; he had promotion in July, 1917, and in the following month received his "wings" in the R.F.C.

MUSPRATT.—Sec. Lt. Keith Knox Muspratt, M.C., Dorset Regt., attd. R.F.C., who died from the result of a flying accident in East Anglia, was 20 years of age, and the youngest son of Mr. Charles D. Muspratt, M.D., of Bournemouth. He had his Army commission in August, 1916, and, transferring to the R.F.C., received his "wings" in the following November.

He was educated at Wychwood, Bournemouth, whence he went to Sherborne School in 1911, and remained there until 1916. He was a School Prefect, and played football for his house—the School House—and was an active member of the O.T.C. From his earliest days he was enthusiastic about flying, and, training at Hendon, chiefly in his holidays, he took his flying certificate before he left school. Receiving his commission, he joined the R.F.C., and in the following November he had his "wings." His ability was recognised by his being employed as an instructor before he was 19, and afterwards by his appointment to a testing squadron. He went to France last May, and in September was awarded the Military Cross.

NICHEL.—Cadet Clark Brockway Nichel, American Flying Service, attd. R.F.C., died on Feb. 19th from injuries received in an aeroplane mishap in the Eastern Counties. He was 24 years old and had not been long in this country.

NORRIS.—Capt. Edward Fraser Norris, R.F.C., who was killed whilst flying at Oxford on March 15th, was the only son of the late Lt.-Col. E. E. Norris, R.F.A., and Mrs. Norris, of Harrow Weald. He was 22 years of age.

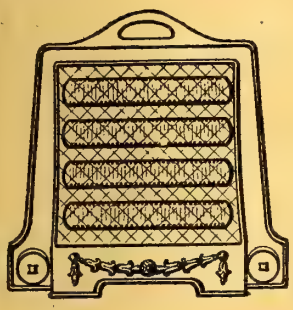
NUTKINS.—Lt. Vernon William Nutkins, R. Scots Fusiliers, attd. R.F.C., who was accidentally killed abroad on Feb. 19th, was the grandson of Mr. Alfred Saunders, of 37 and 38, Mark Lane, and Erin Villa, Putney, S.W. He was educated at University School, Hastings, which he left at the age of 17, in 1913. He entered Sandhurst in the following year, and was gazetted to the 3rd Batt. 7th R. Scots Fus., and was senior subaltern in his battalion. Later on he was posted to another battalion of the same regiment, and was made Lewis machine-gun officer, having previously been musketry officer to the 3rd Batt. He went to the front in 1916, and was twice wounded, and badly shaken by a shell which burst close to him.

ORCUTT.—Sec. Lt. M. H. Orcutt, R.F.C., who was killed in action on March 1st, was the second son of Mr. and Mrs. H. F. L. Orcutt, Rowington Hall, near Warwick. He was 20 years of age.

PASKE.—Flt. Serjt. Paske, a cousin of Lord French, was killed in a flying accident at Hounslow on March 22nd.

A verdict of accidental death was returned at the inquest at Hounslow on March 25th, and evidence showed that when some 600 ft. from the ground he rolled his machine and then tried a spiral nose-dive, from which he could not recover.

Capt. Benbow, R.F.C., stated it was unwise to roll a machine at such a low altitude.

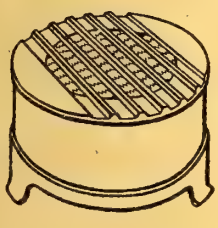


Flt.-Serjt. Reginald Cannon Paske, R.F.C., was second son of the late Gen. William Paske and brother of Maj. Arthur Goldingham Paske, Royal Fusiliers. He was 20 years of age, and was educated at Wellington College, where he won distinction in athletics, particularly in swimming. Enlisting in the Royal Flying Corps, he made great progress, and his Commanding Officer pronounced him an expert pilot. He was to have been recommended for a commission before leaving for France early next month.

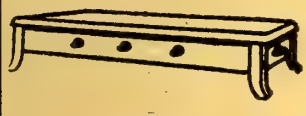
PAYNE.—Sec. Lt. Henry Payne, R.F.C., of Surbiton, was killed through the fall of his aeroplane. The accident occurred in East Kent. At the inquest on March 14th, it was stated that medical assistance was sent to Mr. Payne by aeroplane.

PHILPOTT.—Capt. John Reginald Philpott, M.C., R.F.C., who died on Jan. 15th while a prisoner of war in Turkish hands, was the only son of Canon J. H Philpott and of Mrs. Philpott.

BELLING
ELECTRICAL ACCESSORIES.



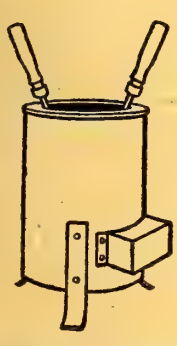
AIRCRAFT Manufacturing Purposes.



ELECTRIC FIRE.
OFFICE PATTERN. List No. 617.
An ideal fire for small offices, waiting rooms, passages, etc. We have also supplied a large number to Aerodromes for general heating. Numerous other designs are available.
PRICE **35 -**
Dimensions—Height 17⅜ in., Width 17¼ in., Depth 5¾ in.

ELECTRIC AIR WARMER.
List No. 960.
A reliable low temperature heating appliance, suitable for work rooms, etc. Can be used in any position without risk of fire.
PRICE **25 -**
Dimensions—Length 15½ in., Width 6½ in., height 4½ in.

ELECTRIC BOILING RING. List No. 7.
This will do all the same operations as an ordinary gas ring. Used for heating glue pots, and when loaded at 250 watts can be attached to any electric lampholder.
PRICE **15/-**
Diameter 7 in.



ELECTRIC HOT PLATE. List No. 18
Useful for keeping food warm, and also for drying purposes of all kinds.
PRICE **100/-**
Size 36 in. by 18 in.

ELECTRIC IMMERSION HEATER.
A reliable appliance for heating water, oil and other liquids. Can be easily fitted to existing tanks, etc.

ELECTRIC ENGINE WARMER.
For placing under engine in cold weather to prevent freezing. They are quite gas and fireproof.
PRICE **40/-**
Size 12 in. by 7 in.

ELECTRIC SOLDER POT. Type A.
This is the latest system for heating ordinary soldering irons, and consists of a pot of molten solder into which the irons are placed for a short time till heated.
PRICE **65 -**
Dimensions—Outside diam. 8in., inner pan 5⅜ in. diam. at top, Depth 7 in.

All the above prices are subject to an advance of 5 per cent.

Our Catalogue illustrates many other special appliances we make for Manufacturing Purposes, Munition and Factory Work, Hospitals, Mess Rooms, etc.

BELLING & CO., *MANUFACTURING ELEC. ENGRS.,*
DERBY RD. WORKS, MONTAGUE RD, EDMONTON, LONDON, N.18.

Controlled

That word has assumed a new meaning in our War experience and, to the firm with an organization capable of producing Munitions or other Government requirements, usually implies the complete cessation of normal business.

That is our position to-day, and every machine, every tool, every worker is engaged on the fulfilment of the National purpose, *but*—

That position will pass and, in the interests of British Manufacture, we desire, even at this period, to discuss the question of the mass production of Repetition parts, for which our greatly widened facilities are particularly suitable.

With this object we invite correspondence with bulk buyers, who desire, with us, to make real preparation for Post-War Trade.

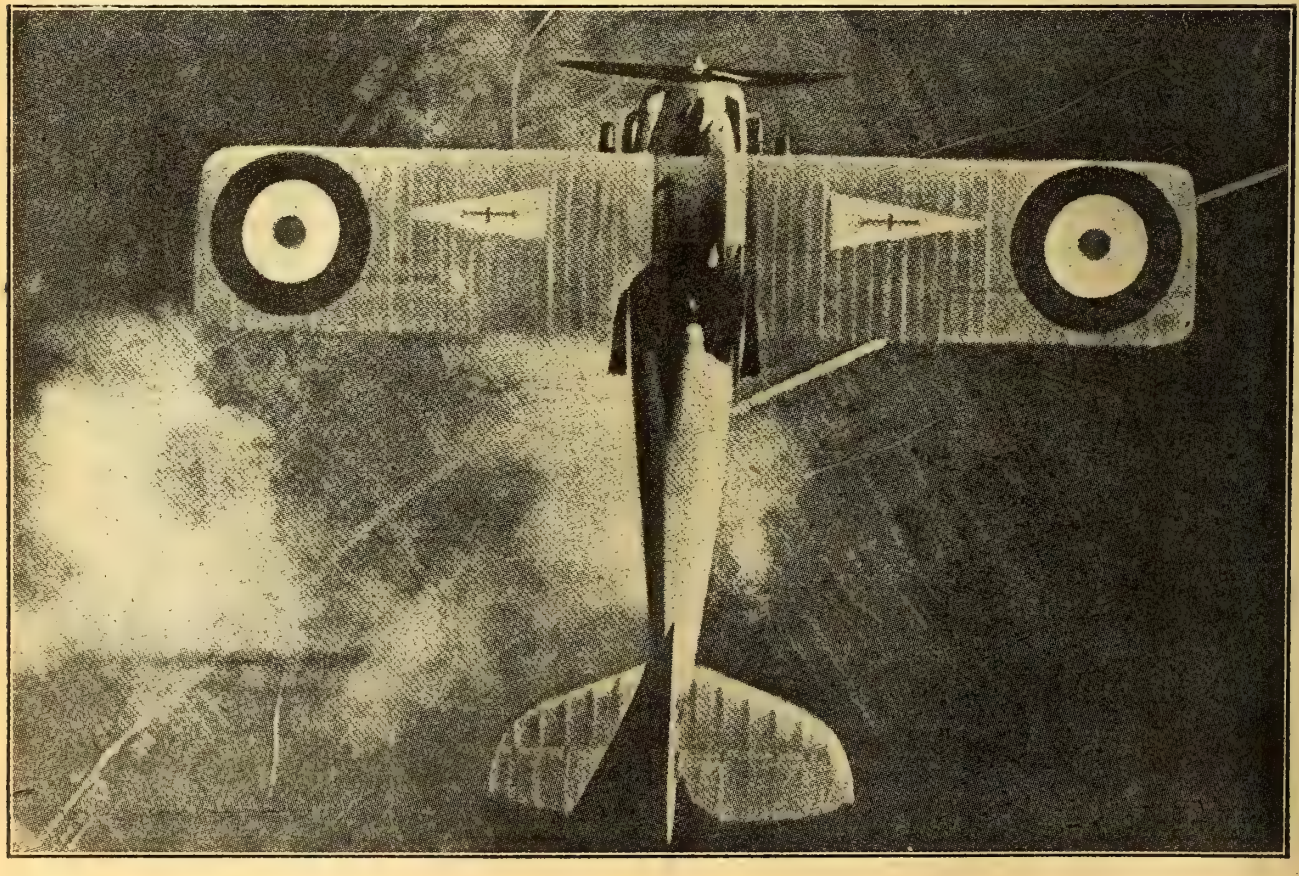
of Southchurch Rectory, Southend. He was 24 years of age, and had won the Military Cross. His appointment as Flight Commander was dated Oct. 7th, 1916. Mr. Philpott was educated at Windlesham House, Brighton, whence he obtained a foundation scholarship at Marlborough. After two years at Magdalen College, Oxford, he obtained a commission in Aug., 1914, in the Suffolk Regt. He transferred to the R.F.C. in Aug., 1915, obtained his "wings" in November, and went to France the following month. After nearly a year's service there, during which he obtained the M.C., he received his promotion as flight commander, and after a further period of home service he was sent with his squadron to another front in June, 1917. There he was taken prisoner on Sept. 25th when flying on reconnaissance, being brought down owing to the failure of his engine.

PITMAN.—Capt. Arthur F. E. Pitman, Seaforth Highlanders, attd. R.F.C., was reported missing on Jan. 3rd, and information has now been received from the British Red Cross, through their Copenhagen agency, that Capt. Pitman was killed in action on that date. Capt. Pitman, who was the eldest son of Mr. John S. Pitman, of 22, Douglas Crescent, Edinburgh, was educated at Evelyns and at Eton, where he was in the Eton Eight, a member of "Pop," and on the Athletics Committee. On the outbreak of the war he left Eton, a year before his time, and obtained a commission on Sept. 4th, 1914, as second lieutenant in the 5th Seaforth Highlanders. He went to France with his battalion on May 1st, 1915. After serving for 18 months in France, during which time he was A.D.C. to the Divisional General, and afterwards captain and adjutant of his battalion, he was seconded for service with the Machine Gun Corps, and acted as instructor to a "Tanks" Cadet Corps for some months in this country. In June, 1917, he was appointed to the R.F.C., and, after training, he went out to the front as a pilot on Nov. 1st, 1917.



RICKARDS.—Lt. Hew Wardrop Brooke Rickards, R.F.A., attd. R.F.C., was reported missing on July 28th, 1917, and is now officially presumed to have been killed that day in action. He was the only son of the Rev. and Mrs. W. Brooke Rickards, of The Rectory, Sanderstead, Surrey. He was born in 1896, and educated at Arden House School, and at Uppingham. He left school in 1914, and went to France to learn the language, and when war was declared he enlisted in the French Army, being attached to the Foreign Legion, with which he saw nearly six months' active service. In February, 1915, he was transferred to the Home Army, receiving a commission, which was afterwards made permanent, in the R.F.A. He went out to France in July. In August, 1916, he was attached to the R.F.C., and in November was wounded when in action. On recovery he went through his training in England, and obtained his "wings" in May, 1917, when he returned to the front. On July 28th he was engaged on a bombing expedition behind the enemy lines, when he was reported missing, and he is now presumed to have been killed in aerial fighting that day.

RUTTER.—Lt. (temp. Capt.) Donald Campbell Rutter, M.C., R. Sussex R., Spec. Reserve, and R.F.C., who was reported missing on June 7th, 1917, at Messines, is now officially reported killed in aerial combat on that date, was the eldest son of Hugh Campbell Rutter, J.P., and Hilda Rutter, of Hazelwood, Morden, Surrey. He was 20 years of age.

SANDY.—Lt. J. Lionel Sandy, A.F.C., who died of injuries received in action, on Dec. 18th, 1917, was the eldest son of Mr. and Mrs. J. Montague Sandy, "Blenheim," Burwood, N.S.W. He was 32 years of age.

SCHNEIDERS.—1st Air Mech. Albert Michael Schneiders, R.F.C., who was killed in action on March 27th, was the youngest son of Mrs. Selina Schneiders, 26, Redlands Road, Reading (formerly 69, St. Gabriel's Road, Cricklewood), and brother of George H. Schneiders, Durward Street, E.1. He was 19 years of age.

SCOTT.—Lt. Charles Dalkeith Scott, Quebec Regt., attd. R.F.C., who was reported missing on Sept. 30th, 1917, is now, from information obtained from German sources by the British Red Cross Society and by the courtesy of Mr. Cohen, of Montreuse, reported killed in aerial combat on that date. He was the only son of the late Capt. Dalkeith Martin Scott (Superintendent Carmarthenshire Constabulary) and of Mrs. Scott, of 47, Rivers Street, Bath, and grandson of the late Lt.-Col. Edward Scott, of The Priory, Maidstone. He was educated at Bath College, where he was in the 1st Rugby XV, and also for several years served in the cadet corps. On leaving college he took up work in Vancouver Island, and was there on the outbreak of war, when he at once enlisted at Victoria, and crossed to England with the First Canadian Contingent in Oct., 1914. Early in 1915 he went over to France, and served with the 16th Canadian Battalion at the second Battle of Ypres, at Richebourg l'Avoué, and the various battles in which the 1st Canadians took part during that year. In January, 1916, he was given a commission in the Canadian Infantry, and was later appointed wiring officer to his brigade, serving at the front

ALUMINIUM CASTINGS
OF EVERY DESCRIPTION.

We make a Speciality of Aeronautical and Automobile Work.

We are making many thousands of **Aluminium Die Castings** weekly under the celebrated **Cothias** process—in many cases **entirely eliminating** machining operations, and we hold the sole manufacturing rights in the British Empire for this process.

Chemical and Physical tests are made on our own premises, and our **Castings,** both **Sand** and **Die,** are produced under the most up-to-date and scientific methods.

Sole makers of the **Birmal Aluminium Pistons,** thousands of which are running to-day in a highly satisfactory manner under the most severe conditions.

Highest Class Castings to Government Specifications. Prompt Delivery.

BIRMINGHAM ALUMINIUM CASTING (1903) CO., LD.
Cambridge Street Works, BIRMINGHAM.

until October, 1916, when he was wounded and sent home. On recovery he was attached to the R.F.C., and, taking his pilot's certificate early in September, 1917, was sent out to the front, where, when on special duty behind the German lines, he was attacked by a "large formation of enemy scouts" and seemed to be overwhelmed and driven down "after a fine fight." Mr. Scott was 28 years of age.

SCUDAMORE.—Capt. Robert Capel Scudamore, M.C., Gen. List and R.F.C., who was killed in action in France on Feb. 26th, was the only son of Mr. and Mrs. Capel Scudamore. He was 23 years of age.

SELOUS.—Capt. F. H. B. Selous, M.C., Royal West Surrey Regt., attd. R.F.C., who was reported missing on Jan. 4th, 1918, is now officially reported killed on that day, aged 19. He was the eldest son of the late Capt. F. C. Selous, D.S.O., the well-known African hunter and explorer, who was killed in action in East Africa on Jan. 4th, 1917. He was educated at Bilton Grange, Rugby, and at Rugby, where he showed signs of becoming a fine athlete, and was in the Running VIII, and captain of the Rugby XV in 1915. He entered Sandhurst in Sept., 1915, and on leaving in April, 1916, was gazetted to the Royal West Surrey Regt. and attached to the R.F.C. He went to the front first in July, 1916. He was awarded the Military Cross and the Italian Silver Medal for Military Valour.

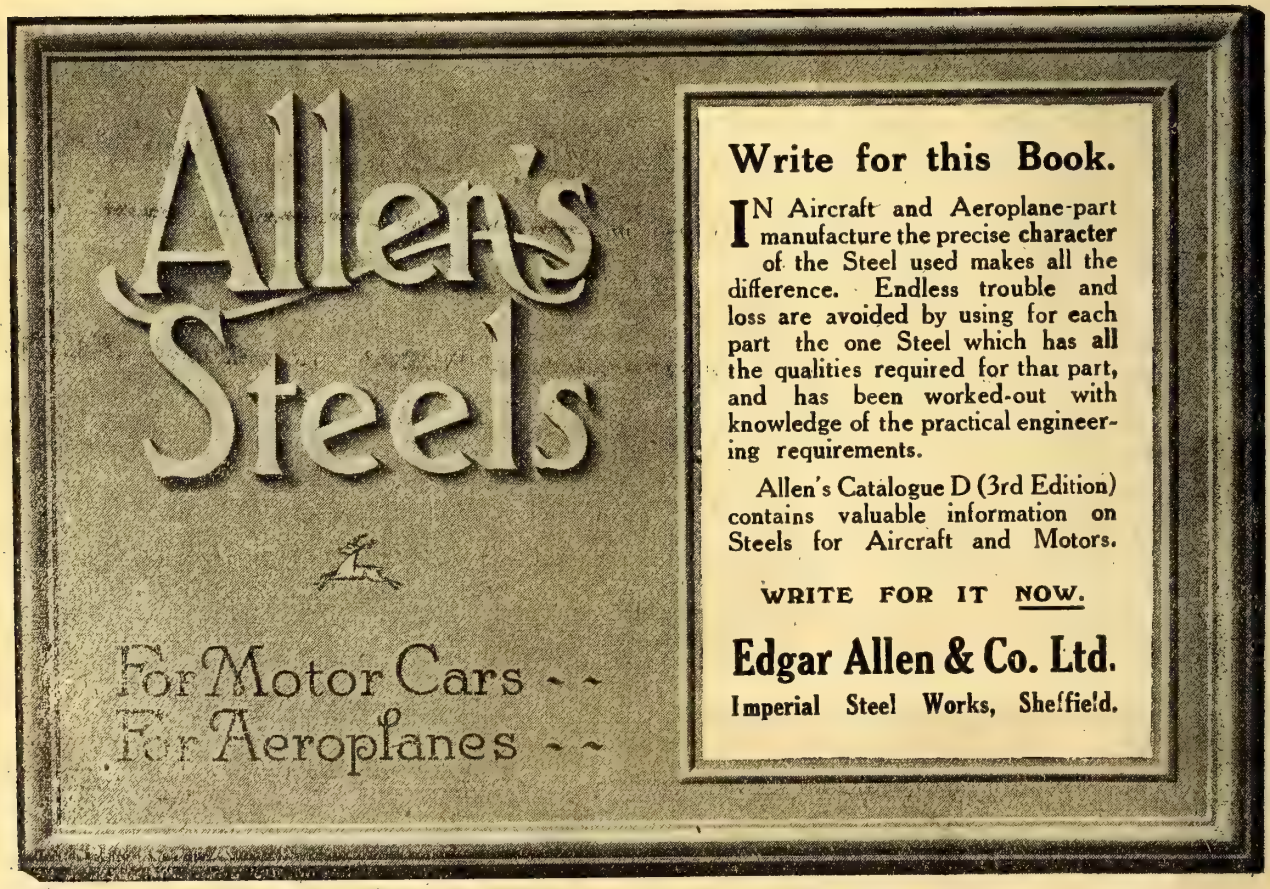
SONDHEIM.—Sec. Lieut. Walter Sondheim, R.F.C., who was accidentally killed on March 4th while flying, was 20 years of age and the only son of Mr. and Mrs. S. Sondheim, of Park Town West, Johannesburg. He was appointed to the Royal Flying Corps in October, 1917.

STROUD.—Capt. H. Clifford Stroud, R.E., attd. R.F.C., who was killed on the night of March 7th-8th, aged 24, was the only son of Professor H. Stroud, of Armstrong College, Newcastle-on-Tyne.

After taking his B.Sc. in engineering at Armstrong College, Newcastle-on-Tyne (Durham University), he proceeded to King's college, Cambridge, and graduated B.A. He was a student of the Institute of Civil Engineers and a graduate of the North-East Coast Institution of Engineers, before which body he had read papers, and received institution prizes. He was gaining his practical experience at Sir William Arrol's, Glasgow, during the university vacations, and intended to complete his practical training after taking his degree.

After spending two years in the O.T.C. at Durham University, he joined the Northumbrian Divisional R.E. Territorials in 1912, and on the outbreak of war immediately volunteered for foreign service. He went to France with the first Field Company N.R.E., and was severely wounded in the legs on February 18th, 1915. He spent many months in hospital, and on his recovery went to Otley, and was engaged in the teaching of bombing and trench warfare. As his wounds unfitted him for active field work he joined the R.F.C. in July, 1916, and after he had obtained his theoretical training he qualified for his wings, and was gazetted on Sept. 22nd, 1916. During the subsequent months he became an expert pilot. He was very popular with his colleagues, and will be deeply missed by his many friends.

SYKES.—Sec. Lt. Leslie Gordon Sykes, R.F.A., attd. R.F.C., who died on March 22nd as the result of a flying accident was the only son of Mrs. H. H. Sykes and the late Lt.-Col. H. H. Sykes, V.D., of Briarcourt, Lindley, Huddersfield.



TANCOCK.—Lt. Osborne George Tancock, M.C., R.F.A., attd. R.F.C., who was killed on March 17th while flying abroad, was 20 years of age and the elder son of Lt.-Col. and Mrs. O. K. Tancock, of Bedford. He had his promotion to the rank of lieutenant in July, 1917, and had won the Military Cross.

TAYLOR.—Capt. G. C. St. C. Taylor, London Regt., attd. R.F.C., who was killed in action on March 17th, was the husband of Doris Taylor (née Reynolds), of 105, Cranbrook Road, Ilford, Essex. He was 28 years of age.

THOMPSON.—Lt. J. W. R. Thompson, R.F.C., killed in action on March 22nd, was the son of Mr. A. Warren Thompson, of St. Nicholas Street, Scarborough, who almost at the same time received news that a younger son, Sec. Lt. A. E. Thompson, R.F.C., was wounded on March 24th and is now in hospital. Mr. J. W. R. Thompson, who was 22, took a lively interest in local sports at Scarborough, in particular hockey and swimming. He joined the R.F.C. in the early days of the war, and received his commission in the field. He was twice mentioned in dispatches. For some time he had been in England on instructional duties, and at his own request he went out to the front again about two months ago.

THOROWGOOD.—Capt. and Flt.-Comdr. Leslie Vernon Thorowgood, R.F.C., who died on March 22nd as the result of an accident, was the only son of Mr. and Mrs. Arthur F. Thorowgood. He was 23 years of age.

TILNEY.—Maj. Leonard Arthur Tilney, M.C., who was killed on March 9th whilst fighting in the air over the enemy lines, held the rank of Lieutenant Royal Horse Guards and that

ALL-BRITISH

D. ANDERSON & SON, Ltd., Lagan Felt Works, Belfast; and Roach Road Works, Old Ford, London, E.

of Sqdn. Comdr., R.F.C. He was in his 23rd year, and was elder son of Lt.-Col. R. H. Tilney, D.S.O., at present on service abroad, and of Mrs. Tilney, of Millbank House, Tattenhall, Cheshire. Maj. Tilney was educated at St. Neots, Eversley, Hants, and at Eton.

On the outbreak of the war he was in camp with the E.C.O.T.C., and immediately obtained a commission in the Duke of Lancaster's Own Yeomanry, of which his father is colonel. Three months later he joined the R.F.C., and obtained his "wings" in virtually record time. Proceeding to the Western Front, he was promoted Flt. Comdr. in Sept., 1915, and afterwards returned to the Central Flying School as instructor.

In July, 1916, he transferred to the Royal Horse Guards, being still seconded to the R.F.C. In Feb., 1917, he was given command of a squadron which he led with great distinction, gaining the Military Cross and the Belgian Croix de Guerre, and being made an Officer of the Order of the Crown of Belgium.

TINNE.—Capt. Stuart Christian Tinne, R. West Kents and R.F.C., whose death was announced recently, was born on Aug. 21st, 1895. He was educated at Mr. Churchill's, Broadstairs, and Wellington College, and entered Sandhurst in Feb., 1913. Receiving his commission in the West Kents in Aug., 1914, he went to the front the following month, but was wounded and incapacitated at the end of that year. After long hospital treatment, and being disabled for infantry work, he joined the R.F.C. in March, 1916, and went to the front with the — Squadron in Oct. of that year. In April of last year he was attached to the Photography Section, and was engaged in that work up to his death.

TIPTON.—Capt. Richard J. Tipton, R.F.A., attd. R.F.C., who died of wounds on March 11th, was the third son of John W. and Mary Tipton, Oxton, Birkenhead. He was 25 years of age.

One who shared captivity with him says:—

"Capt. Tipton was one of the three officers who escaped last autumn from Kastamuni to the north coast of Anatolia and thence across the Black Sea to Russia—a seven weeks' journey. He went to France in February, and had only been there a few weeks when he received the wound of which he quickly died, at the age of 25. To perish within so short a time of escaping from a prisoners' camp seems like the acme of ill-fortune, but 'Tiny,' as he was called by way of allusion to his 6ft. 4in., had no other wish than to get back to the front, and would not have desired a better fate than to be killed in action. He refused an offer of promotion which would have involved his remaining in England. The officers and men who were his fellow-prisoners loved him, and will learn of his loss with the deepest regret."

TREGARTHEN.—Lt. Ernest W. Tregarthen, Royal Welsh Fusiliers, attd. R.F.C., was accidentally killed while flying on March 18th. He was the son of the late Mrs. Tregarthen, of Westville Road, Cardiff, was 30 years of age, and was formerly with Messrs. Hull, Blyth and Co., of the Docks, Cardiff. While with them he became an associate of the Secretaries' Institute, and he was working for his final examination when he joined the Inns of Court in November, 1915.

VINSON.—Capt. Albert Higgs Vinson, R.F.C., who was killed on March 22nd, was the elder son of Albert Vinson, J.P., Parsonage Farm, Belvedere, Kent. He was 21 years of age.

WATSON.—Sec. Lt. George W. A. Watson, R.F.C., who was killed on March 7th, was the eldest and only surviving son of the late James Watson, of Conistone, near Grassington, and was 20 years of age. He was educated at Appleby Grammar School, and when war broke out he was an engineering student at Leeds University, where his work showed signs of great promise; and he immediately offered himself for service in the R.N.A.S. As he was only 17 at the time he was refused as too young, and he then enlisted in the R.N.D. After serving for some months he was brought back to Leeds to take a position as assistant manager of a department in a shell factory; but this work did not satisfy him, and he soon applied again for a commission in the R.F.C., and was successful. At the end of his training he came out head of 300 in the examination. He went to the front only a fortnight before his death.

WESTLAKE.—Lt. Albert Neave Westlake, M.C., B.A., North Staffordshire Regt., and R.F.C., who was previously reported missing and is now reported killed on Jan. 4th, was the only son of Mrs. Westlake, Wayside, Waleham, Dorset. He was 24 years of age.

WHEELOCK.—Sec. Lt. Charles Herbert Wheelock, R.F.C., who was killed on March 19th as the result of an aeroplane accident, was the son of Mr. and Mrs. C. R. Wheelock, Orangeville, Ontario, Canada.

WORSLEY.—Sec. Lt. Reginald Eric Milne Worsley, R.F.C., who was killed in action on March 8th, was the eldest son of Edward Milne Worsley, formerly of Dedham, Essex, and grandson of Reginald Worsley, solicitor, of Manchester. He was 20 years of age.

YOUNG.—Lt. James Hill Young, London Regt. and R.F.C., who died on Jan. 17th of wounds received on Jan. 12th while

Manufacturers of Steel of every description, including

HIGH GRADE NICKEL STEEL & FORGINGS

for Naval and General Marine Purposes.

Special Heat Treated Alloy and other Steels for Aircraft and Automobile Purposes

IMPORTANT SPECIALITIES:

S.S.G. — **A SPECIAL NICKEL CHROME GEAR STEEL.**
FOR AIR OR OIL HARDENING. When treated this steel has exceedingly tough properties and is specially suitable for Gear Wheels, Connecting Rods, etc.

S.G.W. — **A NICKEL CHROME STEEL IN FOUR GRADES.**
Eminently suitable and strongly recommended for Gears, Crankshafts and other highly stressed parts, and having exceptional machining qualities. Combines unusually heavy shock-resisting and wearing properties with silent running.

G.P.S. — **A HIGH GRADE ALLOY CASE HARDENING STEEL**
for severely strained parts, such as Gear Wheels, Gudgeon Pins, etc.

Continental Steel Works and Novo Steel Works, Sheffield.

ENGAGEMENT

McKENNA—LALLEMAND.—An engagement is announced between Capt. Hugh W. McKenna, R.F.C., and Hélène, youngest daughter of Mme. Lallemand, of Civray and Paris. The marriage will take place in Paris, the date to be announced later.

MARRIAGES.

DENNING—SMYTHE.—On March 21st, at St. Mary Abbot's, Kensington, Capt. C. ffolliott Denning, M.C., R.F.C., eldest son of Dr. and Mrs. C. E. Denning, of Epping, was married to Eileen J. Smythe, youngest daughter of Mr. and Mrs. Smythe, Darlington, Yorks, by the Rev. J. Keith.

EVANS—TURNER.—On March 23rd, at St. Paul's Church, Herne Hill, Sec. Lt. John Morgan Evans, R.F.C., second son of Mr. and Mrs. Evans, of 88, Balfour Road, Ilford, was married to Isabel, eldest daughter of Mr. and Mrs. G. W. Turner, of 186, Loughborough Road, Brixton, by the Rev. L. P. Smith, M.A.

McKINNON WOOD—SPICER.—On March 27th, at Whitefields, Sec. Lt. Ronald McKinnon Wood, R.F.C., third son of the Rt. Hon. Thomas McKinnon Wood and Mrs. McKinnon Wood, of 16, Portland Place, was married to Gwendoline Elaine Dykes, fifth daughter of the Rt. Hon. Sir Albert Spicer and Lady Spicer, of 10, Lancaster Gate, by the Rev. A. Sandison, uncle of the bridegroom.

BIRTHS.

BEOR.—On March 29th, at the Imperial Nursing Home, Cheltenham, the wife of Lt.-Col. B. R. W. Beor, R.F.A. and R.F.C.—a daughter.

WISE.—On March 9th, at Beavor Lodge, Hatch End, Middlesex, to the wife of Lt.-Col. P. K. Wise, D.S.O., R. War. R. and R.F.C.—a daughter.

FRANCE.

OFFICIAL COMMUNIQUÉS.

March 27th.—Allied aviators successfully bombed the enemy depôts of Demirhissar (east of the Struma) and the encampments to the south-east of Resna (north of Lake Prespa).

March 28th.—Army of the Orient.—British aviators carried out successful bombardments in the region of Doiran and on the railway line Seres-Drama.

March 29th.—In the period from March 23rd to March 26th our aviation Service took part in the battle in conditions that were particularly costly to the enemy.

Our infantry aeroplanes, our bombing and chasing crews, as well as our photographers and observers, distinguished themselves by their courage and endurance, and did very hard work both by day and night.

On the 23rd alone one of our groups of squadrons carried out 125 patrols and 120 reconnoitring missions. Many squadron reports, moreover, have not yet been received in the region St. Quentin, Ham, La Fère, Noyon.

Over 50 tons of projectiles were dropped between March 22nd and March 26th on convoys and moving trains and on gatherings of enemy troops, which suffered losses from these air attacks that were carried out with admirable boldness.

Descending sometimes to a height of 60 feet from the ground our pilots attacked enemy contingents with their machine-guns and fired thousands of cartridges.

Among other operations must be mentioned that which we carried out in the afternoon of March 27th, when 60 fighting and 20 bombing machines swooped down upon masses of German infantry and put them to flight after mauling them severely.

In addition, there were explosions in several munition depots and great fires were observed in the course of these bombardments.

Our bombing machines belonging to the Eastern district cooperated in the general plan of action by attacking the great strategic railways stations of Metz-Sablons and Thionville. Several fires by very violent explosions broke out in the station of Metz-Sablons.

During the night of March 23rd-24th one of our squadrons dropped 3¼ tons of explosives on the Badische Aniline Factory at Ludwigshafen, the chief German factory for the production of poison gas.

Finally, 37 German aeroplanes and six captive balloons were brought down and destroyed by our pilots and five other machines by the anti-aircraft defences.

March 30th.—During the days of March 27th and 28th our aviators, notwithstanding the bad weather, renewed their attacks against the enemy.

Our machines, flying in groups, sprayed with machine-gun fire, and dropped bombs on, the enemy troops in the line of battle and in their concentration zones. Several of our machines made as many as three sorties in the one day; 17,000 kilogrammes (17 tons) of bombs were dropped in the Noyon-Guiscard-Ham region.

Our chaser squadrons, in the course of numerous contests, brought down 13 German machines, seven of which were totally destroyed and six seriously damaged. Two captive balloons were also set on fire.

April 1st.—On March 29th and March 30th, in spite of the rain and low-lying clouds, our aviators made many flights.

Five thousand kilos (about five tons) of bombs were dropped on enemy cantonments and railway stations in the neighbourhood of St. Quentin, Guiscard, and Roye. Our aviators frequently attacked with machine-guns and bombs assemblies of enemy troops and dispersed them.

Nine enemy machines and a captive balloon have been destroyed by our aviators.

Italian bombarding machines have taken an active part in recent expeditions and have carried out with magnificent audacity numerous raids over the enemy lines.

Army of the Orient.—French and Serbian aviators successfully bombed enemy cantonments in the region of Pardovica (Vardar Valley) and Rozden (Tcherna region).

7 Years' Experience.

The special correspondent of the Havas Agency with the French armies at the front writes:—

The day before yesterday (March 25th) two entire German divisions advancing towards the battle front were completely annihilated, before they were able to fire a single shot, by machine-gun fire and bombs from about 100 French aeroplanes.

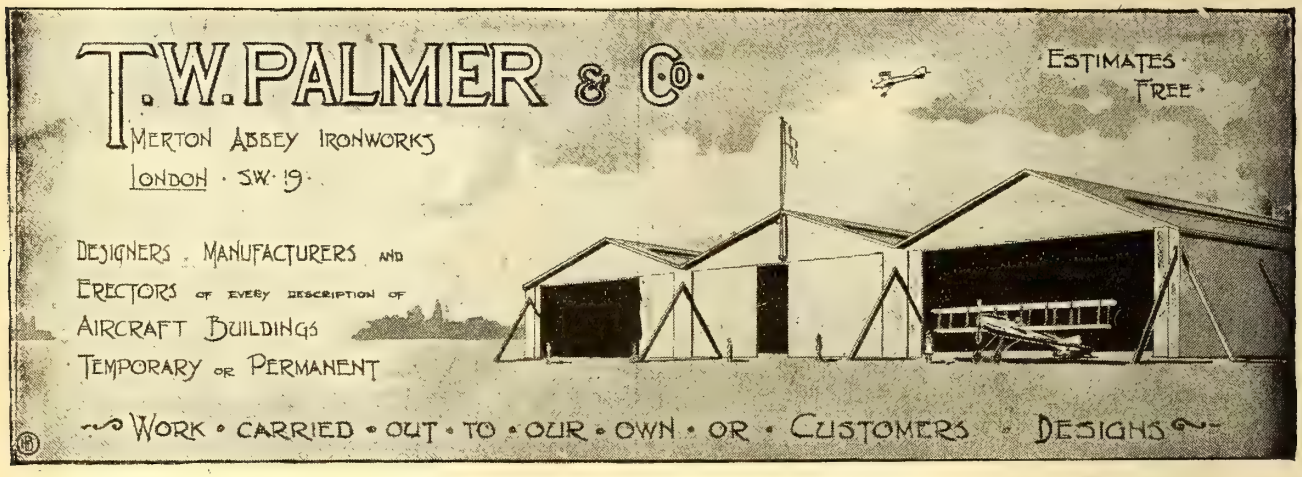
* * *

A Reuter's message from Paris, dated March 27th, states:—

The French Aviation Service took part with considerable effectives in the battle. The results obtained are quite remarkable, and our mastery of the air is being emphasised daily in the theatre of operations.

Our machines drove off the enemy chasing aeroplanes and joined in the fighting in squadrons and groups of squadrons, fiercely attacking columns of infantry and artillery convoys, bivouacs, munition depôts, railway lines, and the enemy's main lines of communication.

They dropped as many as 15,000 kilogrammes (about 15 tons) of explosives in 24 hours and fired thousands of cartridges on the Germans, whom our airmen incessantly attacked with machine-guns, descending almost level with the ground.



A fire was observed in very important ammunition parks, trains on the move were stopped, six observation balloons were set on fire, and a great number of enemy machines were brought down. Important railway junctions connecting the Western front with Central Germany were effectively hit by our bombing machines.

The enemy pilots appeared to be disconcerted by the rapidity and violence of our aerial counter-attack. On the other hand, great enthusiasm prevails among our airmen, who, in these difficult hours, are rivalling in bravery and audacity our magnificent soldiers.

* * *

A Reuter's message from Paris on March 12th states that the Municipal Council of Paris has decided to give assistance to families stricken in the recent air raids and to grant perpetual concessions for their burial. The Government has decided that a special detachment of the military shall attend the funeral of each victim and that the coffins shall be covered with a Tricolour pall.

[It is interesting to note that the French Government has decided to refuse to recognise the civilian victims of air raids as non-combatants, a course adopted by the British authorities some time ago.—Ed.]

OFFICIAL COMMUNIQUÉS.

MARCH 26th.—Since the beginning of the battle 93 enemy aeroplanes and six captive balloons have been brought down.

Rittmeister Baron von Richthofen achieved his 67th and 68th aerial victories, Lt. Bongartz his 32nd, First Lt. Lörzer his 24th, Corpl. Baumer his 23rd, Lt. Kroll his 22nd, and Lt. Thuy his 20th aerial victory.

MARCH 27th.—Rittmeister Baron von Richthofen achieved his 69th and 70th aerial victories.

MARCH 28th.—Rittmeister Baron von Richthofen achieved his 71st and 72nd aerial victories.

MARCH 29th.—Rittmeister Baron von Richthofen obtained his 74th aerial victory.

* * *

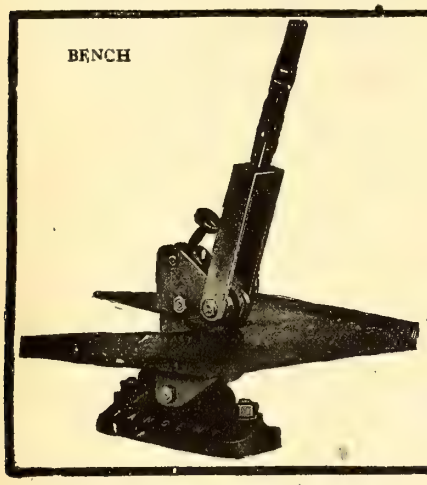
The "Cologne Volkszeitung" of March 25th says:—

"About 1 o'clock last night enemy airmen attempted to attack Cologne. Eight bombs were dropped. The airmen were warded off from the inner city by gunfire and the extinguishing of lights. The only object hit was a pile of timber on the outskirts of the city, which took fire. No one was hurt."

ITALY.

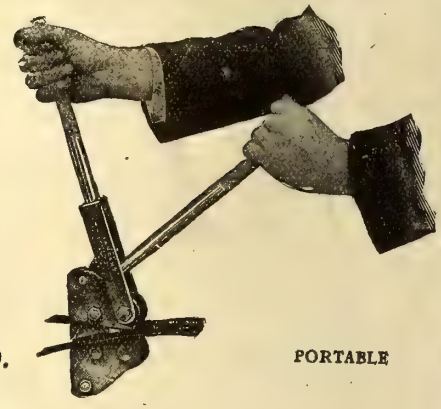
OFFICIAL COMMUNIQUÉS.

MARCH 26th.—Along the whole front the usual artillery actions and moderate activity of our reconnoitring parties are reported.



Five enemy machines were brought down at S. Pietro di Feletto (12½ miles east of the Piave) and Biadene (? Valdobbiadene, on the east bank of the Piave); a sixth hostile aeroplane was brought down by French aviators in the vicinity of Montebelluna (within the Italian lines south-west of the Montello).

MARCH 28th.—Two enemy aeroplanes brought down by British aviators fell to the east of S. Donà di Piave.



MARCH 29th.—Last night our flights dropped 6½ tons of bombs on the railway works of Mattarello and Primolano (Brenta Valley) with very good effects; various big fires were observed. Two enemy aeroplanes were hit by our anti-aircraft fire; one of them was brought down and the other compelled to land beyond the enemy lines in the neighbourhood of Ponte di Piave.

MARCH 30th.—At dawn this morning our aeroplanes bombarded railway lines and aviation grounds of the enemy. An enemy machine was brought down by our aviators in the vicinity of Ponte di Piave, and another by British aviators near Spresiano (right bank of the Piave, five miles below Montello).

March 31st.—British aviators brought down six hostile machines above Manste (north-east of Oderzo) and one on the Melette (Asiago Plateau); two more were forced to land in this last area. One of our pilots shot down an enemy aeroplane on Campomolon, while another one was hit by our anti-aircraft batteries and fell in the Ornic Valley (north of Mt. Tomba).

* * *

According to an official at the Vatican, the Pope has declared to the members of the Sacred College that any aerial attack on Rome will be regarded as an offence against the Roman Catholic Church and an attack on the neutrality of the Holy See. In the meantime, the Pope is taking steps to guard the art treasures of the apostolic palaces.

[This seems to be a case where charity begins at home. Also it shows a lamentable mistrust in his own temporal and spiritual power.—Ed.]

BELGIUM.

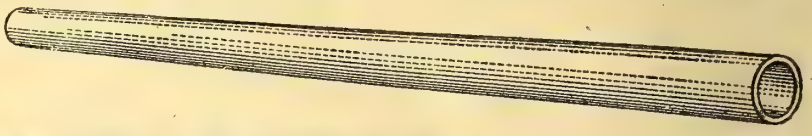
Official Communiqué.

March 27th.—A hostile aeroplane has been brought down in our lines after a combat.

A Reuter telegram dated 12.7 p.m. April 2nd reports that Zeppelins were sighted at a great height at Amsterdam on April 1st. The Flushing correspondent of the "Handelsblad" reports that an aerial attack on the Belgian coast occurred on April 1st lasting about four hours.

LUXEMBURG.

A Berlin telegram says that at 12.45 p.m. on March 28th, enemy aviators attacked the town of Luxemburg. Ten dead are reported.



NORWAY.

Capt. T. Gran, R.F.C. (better known as Lt. Trygve Gran, of South Polar fame, and as the only aviator to fly from Scotland to Norway), who is recuperating from wounds received in action, gave a lantern lecture on March 25th in Christiania.

TURKEY.

Official Communiqué.

March 27th.—On the Euphrates an enemy aeroplane was brought down. The occupants, the Commander of the British Air Corps and a major of the General Staff, were captured. The machine will be ready for service after a few repairs.

Patent No. 4704/15.

U.S.A., 1 Year, $5.20c.

THE DEVELOPMENT OF THE R.A.F.

One of the most surprising developments in the formation of the Royal Air Force is the appointment to high commands of a number of senior officers of both the Navy and Army who have hitherto shown no interest in Naval or Military Aeronautics. It is, of course, highly gratifying that so many officers of such considerable seniority should thus begin to take an interest in Service aeronautics, albeit perhaps a trifle late in life for them ever to understand the details of the aerial profession as a sailor understands the details of ship work or as a soldier understands the duties of a regimental officer. The human brain is not in its most elastic or receptive state after the age of forty.

In the ordinary course of affairs one would have expected that the commands of large areas and the important administrative jobs would have devolved naturally on those able officers who have been responsible for all that is good in the R.N.A.S. and R.F.C. And, be it noted, apart from the high *moral* of the personnel and the individual gallantry of pilots, there has been much excellent work done in both Services.

It is evident, however, that the only persons in the Flying Services who would be capable of taking over the big commands would be the R.F.C. Brigade Commanders who have done such magnificent work in the field. And it is equally evident that it would be impossible to spare such officers from their active-service commands. Therefore it follows that the big home commands must go to Army officers of the seniority necessary to fit them for such commands.

An Unfortunate Circumstance.

The unfortunate aspect of the matter is that such officers will, presumably, be of higher rank than the Brigade Commanders in the field, who are the very men who have built up the Corps from nothing.

It is true that these Brigade Commanders began the war as captains in the Army and temporary majors—except a few who were brevet majors—and that the officers who now come into the R.A.F. were probably lieutenant-colonels or brigadiers at that time, so that on Army seniority they are automatically of higher rank than any R.F.C. officers. Nevertheless it seems a pity that in this entirely new Third Service, in which, above all others, promotion by merit instead of by seniority would be justified, seniority in another service should count for so much.

However, such a state of affairs appears to be unavoidable, and consequently, although one sympathises entirely with the feeling which these appointments have raised on the Corps, one cannot agree with much that is said on the subject. Justice to the individual may be met very easily by promoting the present R.F.C. Brigadiers to such rank as will place them on an equality with the "imported" General Officers. And in any case the rapid growth of the R.A.F. makes it appear that such promotions are bound to occur before many months are past.

Imported Officers.

The following notes on the question of imported officers, written by a civilian who has done excellent work for one of the Flying Services, indicate quite lucidly what is felt by those who have had much to do with building up both Services from their small beginnings in the early days of the war. One publishes these notes because it is well that what is felt by many should find expression, so that those in authority may consider how best such feelings may be allayed. Here then is the hypothesis of the problem:—

The New Service and Its Staff: A Study in Psychology.

The feeling of the civilian who is now dressed as a soldier and who has come into the Air Force towards the regular officer, be he either sailor or soldier, is one that seems little understood by those that sit at the head of the new Service.

Like so many things that are psychological, most of them understand but little of this all-important matter, but the subject is one that affects the whole Air Force right through, and the sooner the problem is appreciated and understood the better for all.

Let us first of all regard the traditions of the Air Force as it is to-day and see on what they are based. They are based on performances done during this war and on little that was done before. It owes its glories and its triumphs largely to the civilian who is "dressed up as a soldier," for to pretend that the airman or A.M., dress him or train him as you will, is a soldier is not to understand the beginning of the subject.

We must go back to before the war and trace a little of the early history of aviation and see how it was all started.

First of all we see the civilian appreciating the possibilities of the whole question of aircraft, and more especially its possibilities from the military point of view. We see civilians, in the form of the Aero Club, offering to lend machines to the Army for manœuvres, and being turned away, as not wanted. We see civilians having to teach the first sailors to fly out of their own pockets.

I point this out, this mind of the official, because as a nation we pay people to see that we are kept up-to-date in all machineries of War, and yet such is imagination in high places among the regular and professional soldiers and sailors that on a matter that was almost entirely a military problem the civilian had to push the Services into seeing what was patent to all.

Now when aviation simply had to be taken up, as an unpleasant new and nasty thing, by the authorities, they started it with a set of regular officers.

I want to note carefully what was the type of officer that they got. They were, I maintain, mutineers against the stifling of initiative in the Army and Navy. They were those who wanted to get away from the ordinary to something with scope and imagination. They were pioneers of thought in the Services.

Small wonder then that the officers who took up flying at the beginning were of the best that there were. Small wonder that of those who remain to-day most of them are beloved and adored by all.

And then came the War, and to this band of "mutineers" (used in its best sense) came into the corps the civilian trying to do his bit, looking to this picked body of officers for example and finding in them all that they wanted to copy, all that was good.

Later others came in besides, either from civil life direct or from regiments. To-day they are chiefly civilians who transfer from other units, but they all come in from the bottom and work their way up, becoming merged in the Air Force.

Now it is not long before an officer coming into the Corps realises that the foundation of the whole structure of the

Flying Services rests on an entirely different basis from that of the Army or Navy.

Take for instance discipline. It may strike one as odd to say that discipline is not essential in the Air Service, but such is the case. All that is really necessary is good behaviour and obedience, which is not got by discipline alone.

The reason for discipline is a military one. It is necessary when one wishes to make a body of men act as a machine, without thought of their individual selves. That is the basic theory of the whole thing, and that is why no body of troops without it is any good in actual fighting, for, under fire and in trying circumstances, they would not act as a unit and a machine but as a rabble.

Now discipline is instilled into men by a sort of imitation of war, that is by drilling, manœuvring, etc. In the Flying Services it may be very pretty to see everyone in a nice line to be looked at, but the moment actual work starts, combined action, as one understands it in the Army, ceases, and it is each man to his individual job, be he a flier or a mechanic.

In no way does regular Army discipline help him or the war. It makes him neither a better flier, a better mechanic, nor a better rigger. To say that only under discipline will he obey his superior officers is an insult to his loyalty and intelligence. Businesses go on without rank and gold braid. Orders are obeyed and work is done without discipline, as the word is understood, in the Services.

Mark, therefore, that one difference, chosen haphazard between the two Services, the old and the new, one in which discipline is a *sine qua non* as a military essential, the other where it is pretty, no doubt, but from a utilitarian and military point of view largely waste of time.

Now the officer who comes into this new Service from the bottom soon understands the whole difference and falls into line. But the "Regular," brought up in a different school, unless he begins at the beginning, does not see that whereas in the Army he and his men were one inseparable fighting unit, now he is an individualist, as also is every air-mechanic under him. He is either a flier apart, who has to do his job away from everyone, or else he is an equipment officer, who is practically a sort of foreman or business manager, helping and encouraging men in their individual work, and understanding it.

Unless a Regular officer starts at the beginning in the Flying Services, therefore, he really does not know how to treat the men he finds there, who are tradesmen dressed up as soldiers, pursuing their useful calling for the sake of the fliers. It is not the smallest use ordering them about like infantry soldiers at their skilled work, they simply don't understand it, and laugh at it secretly. Nor do the A.Ms. understand an officer who looks upon them all as of one make to do exactly what they are told.

Having established one or two examples of the difference between the Services from top to bottom, I do most earnestly put forward the suggestion that it is not in the best interests of the Air Force that officers of high rank from either of the old Services be put straight away into high positions of command or administration in the Air Forces, without any knowledge of even the most elementary facts about the Air.

That is what has been and is being done to-day, and it is causing throughout the Service a bitterness of feeling against the Regular Service officer that never existed when they had to work their way up, and which never would have existed had it not been for this mistake.

The glib answer that one must have people in high administrative positions with knowledge of staff work and experience is, of course, an insult to the intelligence of the meanest. Is a Staff officer brought in from either Service as a Colonel to "direct operations" to gain his experience at the expense of the lives of fliers and of wrecked machines, when any Flying Officer could gain the Staff experience by being attached to units of the Army and Navy to learn the use of the various arms? It would be as logical to put an R.F.C. officer in command of a battalion, because he has a knowledge of air work!

Is the Army so richly endowed with brilliant Staff Officers that it can spare G.S.Os. for use with the R.F.C.? If it is not, and experience tells us so, then is the R.F.C. to be saddled with the cast-offs?

Let there be an end to the importation into the Air Force of the Regular Officer of the old type, with all his intolerant ways. At any rate, let him not be imported direct into high places. Let him start at the bottom.

The Air Force has been built up without them or their traditions, and now, when others have done the work, let them keep away, and not exploit the New Arm for their own advancement, though to the detriment of the Air Force, and its good temper and welfare.

There is sufficient talent in the Air Force without going outside for it and pretending to find it in Regular Staff Officers. We have seen quite enough of the old Army "Club" to look with anything but the gravest suspicion on the start that is being made in the taking of big positions in the New Arm by this "mutual admiration society" of exalted Regular Officers.

The Benefit of Explanation.

A little explanation of an official action, or an order, will frequently do much to allay irritation or bad feeling which is caused by action without explanation. One does not suggest for a moment that subordinate officers or men have any prescriptive right to any such explanation. One has too much respect for the basic principle of discipline—as contained in the line, "Theirs not to reason why, theirs but to do or die"—to suggest that a commanding officer, or a controlling Council or Staff, should issue on principle an argumentative explanation of all orders.

Such a custom would be as fatal as the introduction of the Bolshevik principle which introduced Soldiers' Committees, the election of officers, and the abolition of capital punishment, and so brought about the disintegration of the Russian Army, gave complete and easy victory to Germany in the East, and left the enemy free to bring about his present concentration against the civilised Allies in the West. Such a custom would produce a Service of sea-lawyers, ever ready to argue with their superior officers. The great thing to instil into any fighting force is the ancient maxim, "Orders is Orders."

Nevertheless, when great changes are afoot it seems well on occasion to issue to all those concerned some sort of explanation of the why and wherefore of things. Something in the nature of what a Staff Officer might call "an appreciation of the situation," together with a discussion of the line of operations upon which the High Command has decided, would not merely allay irritation, it would definitely tend to promote loyalty to the new scheme, and would—as in the case of the formation of a new body such as the Air Force—distinctly strengthen *esprit de corps*. At any rate, it would do so to a greater extent than by making everybody companions in misfortune without explanation, either by putting them all into a new and badly designed uniform or by appointing them to serve under strange officers of alien ideas.

A Few More Points Explained.

One has endeavoured in the first part of this article to put forward, without any knowledge of the official reasons, an explanation of some appointments which are troubling Air Force officers and men. Possibly the explanation is quite wrong, but at any rate it seems reasonable, and would probably satisfy most people in the Force if given to them officially.

Similarly on the question of Staff officers it might be well to explain matters. There are those who think that any "office-job" in the Air Ministry could be filled by any wounded or crashed or nerve-strained flying officer. Such people object strenuously to the importation of maimed or invalided Army officers without flying experience to these sit-down jobs.

Whether it is the official reason or not, one cordially agrees with the official action in this instance. The best pilots are by no means distinguished for their brains. And the pilots with brains frequently suffer extremely from what our would-be descriptive writers call the "airman's temperament"—which generally means a mixture of nerves, self-opinion, lack of discipline, and inability to appreciate the beauties of co-ordination—except perhaps in a chorus, from the stalls.

Staff Needs.

Such officers, for all their gallantry and self-sacrifice, would be perfectly hopeless in Headquarters jobs. It would be far better to keep them out of the office on full pay for the term of their natural lives than to try to put them to any useful purpose on the Staff. It is notorious in the Army that, apart from the staffs in the

field, R.F.C. staff work, where it has come in touch with regular Army work, has been on the whole rather like this world before the second day of the Creation. One is fairly safe in ascribing this to the endeavour to employ deteriorated aviators on jobs which distinctly demand a *mens sana*, even if a *corpus sanum* is not necessary.

The Staff officer needs to be first and foremost a trained soldier. One may leave Naval officers out of the question because the Navy has never had a Staff in the proper sense, and only had a War College for about five minutes before war broke out. Therefore the fact that sea war is an exact science like land war has not yet had sufficient time to percolate to the intelligence of a sufficient number of sailors to permit the production of Naval Staff officers as a distinct species.

That being so, the only available Staff officers for the Air Force must come from the Army, with perhaps a few brilliant exceptions, who happen to have been born for the Staff. Any good regimental officer is fit for the work. A good regimental adjutant is better. And, of course, a Staff College graduate is simply a gift from Heaven where the Air Force is concerned.

Apparent Hardships.

It may seem hard that those who have borne the burden in the heat of the day, let alone those who have been frost-bitten in the higher aerial levels at night, should not have the comfortable sit-down jobs at home when they are past flying. But Staff work, like Army reconnaissance, must be done, no matter who suffers. And a job on the Staff is, or ought to be, the hardest work in the Force.

One knows from personal observation that R.F.C. Brigade Staffs in the field work far longer hours on far more monotonous and exigeant work than do any of the people who fight or fly, and that many of those who appear to have cushy jobs at home work equally hard. If every one of those at home worked as hard and as efficiently, the personnel at the Hotel Cecil could be reduced by fifty per cent., the speed of the work would be doubled, and we should get along with the war much quicker. Also it would be necessary to delete the nickname of the Hotel Bolo.

Therefore one is entirely in favour of importing trained soldiers to the technical Staff-work—as distinct from the work of the technical staff, which is quite a different thing. Such officers will set an example of system and method which will ultimately influence the whole Force for good, while in the meantime their own work will be properly done.

Unfathomed Reasons.

There is a certain curiosity concerning some recent appointments which will doubtless be satisfied in course of time. For instance, one sees in the "Gazette" of April 5th that Vice-Admiral Hutchison, C.V.O., C.M.G., R.N., comes into the Air Force as temporary Colonel and honorary Lieutenant-General.

Admiral Hutchison does not appear in any records of Naval or Military aeronautics as having displayed any intense interest in the latest development of war. It may therefore seem strange that he should come in as the equal in rank of Lieut.-General Henderson, who has, at any rate, been intimately concerned with flying since its very early days. And it seems stranger still that he should be superior to Commodore (now Brigadier-General) Sir Godfrey Paine, and to Major-General Sir Hugh Trenchard, who between them built up the whole fabric of the Air Force from its foundations.

Doubtless it was necessary for the Navy to have someone in the Air Force as an "opposite number" to General Henderson. But if so, why Admiral Hutchison in particular? He may be a magnificent officer. If so, it seems strange that the Navy can spare him. And if he is not, then one questions whether he can be of any use to the Air Force.

The appointment of Colonel Lambe, C.M.G., D.S.O. (Captain R.N.), in the same "Gazette" is of similar interest. As a senior Commander R.N., Colonel Lambe had the unpleasant experience of losing his ship, the seaplane-carrier "Hermes," while crossing from Dunkerque to Dover early in the war. The fact that the customary court-martial did not follow gives one to suppose that the circumstances were entirely satisfactory. Thereafter he commanded a land force of the R.N.A.S., which was a kind of out-station of that Dover Patrol which has from time to time been subject to so much criticism.

With the Royal Flying Corps on active service. The adjustment of a heavy bomb on a de Havilland. A Nieuport fighter is seen in the background, apparently ready to start as a guard to the bombing machine.

Much has appeared in the press about the gallantry of the aviators of that detachment, but it is, of course, impossible to relate the inner history of their affairs until after the war. None disputes the gallantry of the officers and men, which has been beyond all praise, but none the less the appointment of the senior officer of their station to be a Brigadier in the Air Force will come as a surprise to many of them, who regarded him as being essentially a sailor.

One mentions these two appointments merely because they happen to occur in the "Gazette" as one writes. Doubtless there are others to which a little explanatory dissertation might be of value. If something in the nature of the citation which accompanies the award of a D.S.O. or a Military Cross were attached to each of such appointments in the "Gazette" it might aid materially in promoting confidence and *esprit de corps* in the Air Force.

In the Army one would expect nothing of the kind, but in such a miscellaneous and hermaphrodite affair as the R.A.F., composed as it is of sailors, soldiers, and civilians, more or less happily mingled, and commanded promiscuously by active—or passive—officers of either the Navy or Army, one feels that anything which would tend towards the consolidation of the Force into one homogeneous whole would be a step in the right direction. The Air Minister is said to pride himself on his freedom from ancient prejudices and obsolete traditions. Perhaps the revolutionary principle of starting off otherwise inexplicable appointees with an explanatory label tied to the lapel of their nice new tunics may commend itself to him.—C. G. G.

THE END OF THE R.N.A.S.

The following obituary notice—apparently officially inspired—of the work of the Royal Naval Air Service was published in the daily newspapers of April 6th:—

The Royal Naval Air Service, which is now part of the Royal Air Force, has achieved a glorious record of service during the war. In March, 1914, it consisted of 125 officers and 500 men; and the number of seaplanes was 62. Since then the strength of the Force has been immensely increased, and it has become splendidly efficient.

When the British ultimatum to Germany expired the R.N.A.S. instantly began active operations, and the dawn of August 5th, 1914, saw our seaplanes and airships on patrol. Throughout the embarkation of the British Expeditionary Force it did invaluable work in patrolling the Straits of Dover and the English Channel on the look-out for hostile aircraft, and from that time onwards it has never failed whenever British naval and military forces have been engaged.

In the early stages of the war the R.N.A.S. provided crews for armoured cars, raided Cuxhaven, attacked Zeppelin sheds, dropped food and medical stores into Kut, bombed the German warship "Königsberg," fought enemy aeroplanes returning from raiding this country, identified enemy cruisers in the battle of Jutland Bank, destroyed Zeppelins, and served as "eyes" for the Grand Fleet.

In June, 1915, Flt. Lt. Warneford gained his V.C. by bringing down a Zeppelin near Ghent. In August Service aircraft attacked a Zeppelin returning from this country and destroyed it. In all, three Zeppelins have been accounted for; and in 24 enemy aeroplanes raids on London and other places 22 of their machines were put out of action, while two others were reported probably to have shared that fate.

On the Western front, valuable work has been done by the squadrons attached to the Royal Flying Corps, and tribute has already been paid to their operations in the great battle now in progress.

In December, 1916, a squadron, working with the Royal Flying Corps, brought down 14 enemy machines, and Sir Douglas Haig expressed his appreciation of its fine work.

On one occasion a seaplane patrolling on the French and Belgian coasts sighted two German destroyers and attacked one with bombs, damaging the deck and stanchions. The pilot dived to 1,000 ft., and attacked the vessel with a Lewis gun, firing a tray at a distance of 300 yards, and scoring hits on the deck and forepart.

There have been frequent single-handed fights with three, four and five hostile machines, and in a number of cases one and sometimes two of them have been destroyed. A noteworthy performance was that of an aviator who, in a fight with two enemy aeroplanes, was hit twice in the right arm. Finding that he was losing much blood, he had to hold the artery with his left hand and fly the machine with the stick between his legs, afterwards making a safe landing.

A memorable fight was an encounter by a British pilot with five hostile machines, at 13,000 ft., off Middelkerke. He attacked them single handed, and four retreated. Into the fifth, a Fokker, he fired 20 rounds, causing it to dive steeply into the sea at Ostend. The pilot found himself close to a large Aviatik, into which he fired the rest of the tray, and made it dive towards the coast. On his way home the same pilot encountered another Aviatik, and, diving at it from 13,000 ft., forced it to descend.

Towards the close of last summer two flights of five Sopwith scouts encountered approximately 25 enemy machines between Ostend and Ghistelles, and a general engagement took place. Our machines completely broke up the formation and a number of the enemy's aeroplanes were either destroyed or badly damaged. Engaging three hostile machines consecutively, one British aviator shot two down, completely out of control, and, possibly a third, while five others were accounted for. All our machines in several other combats returned safely, though five of them were badly shot about, one having 113 bullet holes and both petrol tanks pierced.

Throughout the whole of the operations in the Dardanelles Peninsula the air work was undertaken by the R.N.A.S. The Berlin-Constantinople railway, largely used for the transport of war material, was frequently bombed, forage stores and munition dumps being fired and bridges badly damaged in spite of active gunfire; while trains in motion were bombed and attacked with machine-guns.

The Zeitumlik Powder Factory at Constantinople was bombed, and frequent visits were made to Adrianople, involving flights, in some cases, of over 400 miles. Crop burning was another operation, and enormous damage was inflicted with incendiary bombs. Attacks on enemy battleships, destroyers, and transports in the Dardanelles were frequent.

A noteworthy performance was the attack on the "Goeben" on July 8th last by a large Handley Page aeroplane commanded by Squadron Commander K. S. Savory. This aeroplane flew to Mudros, covering approximately 2,000 miles in 31 hours 34 minutes—a distance which is believed to be easily a world's "record" for a cross-country journey, and also for the weight carried. In his attack on the "Goeben" the aviator made a night flight, arriving over Constantinople at midnight, and afterwards circled over Stenia Bay. The first salvo was followed by a heavy explosion and a big fire. The aviator then proceeded to the upper waters of the Golden Horn and attacked the ss. "General," stated to be the German headquarters, making two direct hits on the after part of the ship. Then steering direct for the Turkish War Office, he made two direct hits on the centre of the building, and returned safely after a seven hours' flight.

Particular attention was paid on one occasion to Chanak in consequence of information which had been received that the Kaiser and his entourage were paying a visit. In spite of very unfavourable weather, several machines set out, but only one succeeded in reaching the objective, and dropped a number of bombs on the town. On his return journey, the aviator struck the side of a mountain in the darkness and the machine caught fire. The pilot, although severely injured, was able to climb out of his machine and was found next morning by a Greek shepherd.

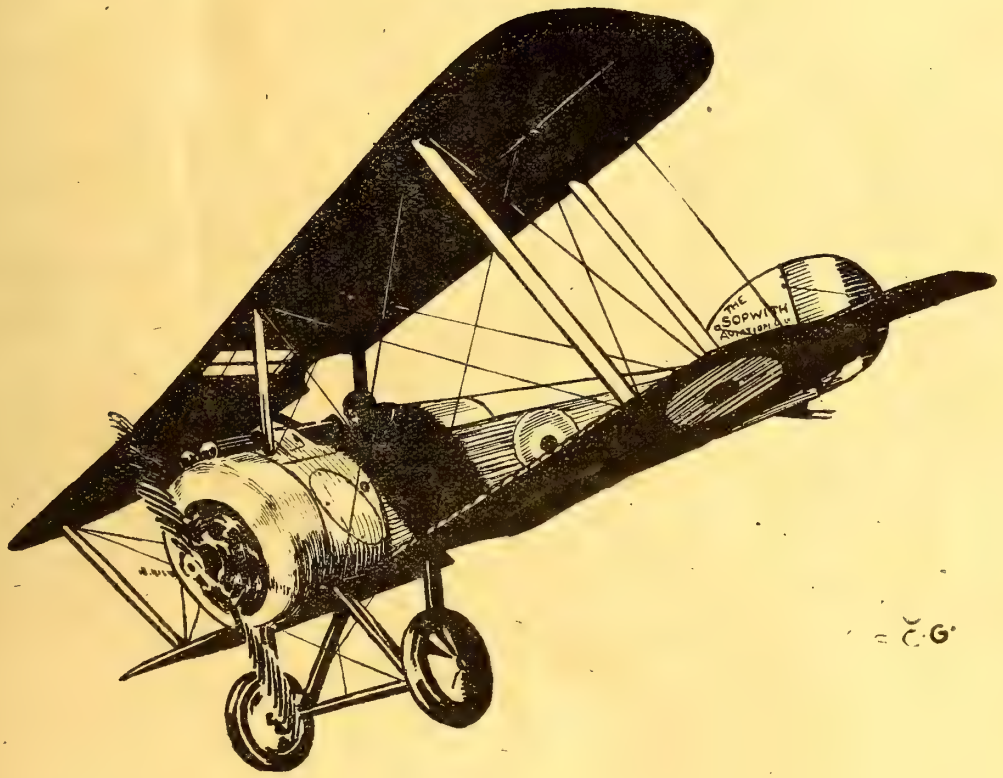
During 1917 the following decorations were awarded to R.N.A.S. officers:—

D.S.O., 29 (four with Bar)
D.S.C., 112 (one with two Bars, 16 with one Bar).
Croix de Guerre, 26 (two with palm, six with star)
Chevalier of Legion of Honour, 12.
Other foreign decorations, 13.

Two V.Cs. have been awarded—one to Flt. Lt. Warneford, and the other to Wing Comdr. Bell Davies, for bravery in the Dardanelles.

LORD ROTHERMERE'S MESSAGE.

The following message has been addressed by Lord Rothermere to the aerodrome workers of the United Kingdom:—



Our splendid airmen during the present battle have accounted for 339 of the enemy's aeroplanes, and have killed very many of the enemy by bombs and by machine-gun fire. They are working night and day for their country.

On their behalf I ask you to do everything you can to hasten construction work now being undertaken at your aerodrome.

Each one of you can help. The more aerodromes we have, the more pilots we can train and the more machines we can have in the air against the enemy. Aerodrome construction work is just as necessary as the work of the airman. Without your help he can do nothing, and without his matchless courage and endurance it will be impossible for the armies in the field to withstand the constantly increasing pressure of the foe.

Rothermere.
Secretary of State for the Royal Air Force.

AIR FORCE MEMORANDUM.—No. 6.

ROYAL AIR FORCE: TERMS AND CONDITIONS OF SERVICE.

Every person enlisted into the Royal Air Force is liable for duty afloat or ashore, at any station at Home or Abroad, and may be detailed to any branch of the Royal Air Force; i.e., Airship, Aeroplane, Seaplane, Kite Balloon Work, or any type of Aircraft if considered medically fit for such service; and may be called upon, if medically fit, to go into the air in Airships, Aeroplanes, Seaplanes, Kite Balloons or any type of aircraft.

The selection of a man for service does not imply that he will be trained as a Pilot.

The terms of service in this pamphlet are those in force for the period of the War.

Cadets.

The earliest age at which a Candidate can be admitted to a Cadet Wing, Class "A" (Officers), or Class "B" (Non-Commissioned Officer Pilots or Observers), is 17 11/12 years. Candidates over 30 years of age are not eligible.

Candidates should not be over 6 ft. 1 in. in height, nor over 13 stone in weight, and their eyesight must be very good.

Admission is by selection, subsequent to an interview, by a Royal Air Force Officer detailed for that duty, and after passing the prescribed medical examination.

Civilian Candidates are required to attest before admission. Full instructions will be issued to each selected candidate.

The initial service pay of Cadets entering from civilian life will be 1s. 6d. a day. Those drawn from other Services will continue to draw the pay of their permanent rank in their former Service if more beneficial). They will be provided with uniform, quarters and rations, and while they are in receipt of these initial rates of pay, a special messing allowance of 1s. a day will be issuable on behalf of each Cadet, unless already being paid as a Sergeant, for each day on which a ration is drawn by his unit on his behalf.

After a period of initial training, Cadets will be primarily classified as Class "A" (Flight Cadet) or "B" (Non-Commissioned Officer Cadet), according to merit, character, personality, education and aptitude for leadership. Cadets of Class "A" will be provided with uniform of Officers' pattern to the value of £15. At any time during training, a Cadet may, on the recommendation of his Commanding Officer, be transferred from Class "A" to Class "B" or *vice versa;* and if found unsuitable for any reason, may be reverted to his original service, employed in the Royal Air Force in some other capacity, or discharged and placed at the disposal of the Ministry of National Service.

Cadets on joining will be posted to a Cadet Wing or School for initial training, and will then pass in succession through Schools of Aeronautics and Armament.

From the latter School, they will be posted to Squadrons for instruction in flying, Class "A" Cadets being then graded as Flight Cadets and given service pay at 7s. 6d. a day, also 4s. a day flying pay, whilst actually under instruction. Class "B" Cadets will be graded as Sergeants (Non-Technical Branch) and given service pay at 3s. 3d. a day, also 1s. a day flying pay whilst actually under instruction.

Flight Cadets will mess with the Officers and others with the Sergeants. The special messing allowance will cease.

On passing Flying Graduations "A" and "B," Flight Cadets will be commissioned and paid as Second Lieutenants receiving 10s. a day service pay and 4s. a day flying pay, while the Sergeants (Non-Technical) will be transferred to the Technical Branch as Sergeant Mechanics receiving 6s. a day Service pay, also 1s. a day flying pay. Flight Cadets, on being commissioned, will be credited with £35 towards the cost of completing their uniform and kit. Sergeant Mechanics will retain the full kit issued to them.

On passing Flying Graduation "C," or if required to proceed overseas before such graduation is completed, pupils may be authorised to wear their "wings" and given full flying pay, Officers at the rate of 8s. a day and Sergeant Mechanics at 4s. a day if Pilots and 2s. a day if Observers.

Thereafter, Officers will be eligible for promotion, etc., within the Royal Air Force, which, in the Flying Branch itself, leads to

Lieutenant—12s. service pay, rising to 16s. a day, with 8s. a day flying pay whilst employed on duty which involves flying.

Captain—19s. service pay, rising to 20s. a day, with 8s. a day flying pay whilst employed on duty which involves flying.

Major —32s.
Lieut.-Col. —40s. } a day inclusive.

The above rates are exclusive of free quarters, rations, fuel, light and servant, or allowance in lieu. Officers serving with expeditionary forces also draw a field allowance. Up to and including the rank of Lieutenant, married Officers may receive an allowance for children.

A successful pilot may arrive at his commission with the full pay and duties of a Flying Officer, in from four to six months after joining, and it may be added that in the Royal Air Force the prospects of distinction and of subsequent promotion are unrivalled.

Pension and half-pay rates and conditions have not yet been finally settled.

Applications to join should be made in letter form, stating full personal particulars, to the Royal Air Force Reception Depôt (see next page) which is nearest to the residence of the applicant, or address where he is registered under the Registration Act.

Men.

Period of Service.

(1) Duration of War.

(2) Normal Period; i.e.,

(a) Four years with the Colours and four on the Reserve. Men may, six months before the termination of four years' Colour Service (if recommended by their Commanding Officer and Air Ministry Authority is given), extend their period of Colour Service to complete eight years with the Colours and four years on the Reserve.

(b) Eight years with the Colours and four years on the Reserve. Men in either paragraphs (a) or (b) may, six months before the termination of eight years' Colour Service (if recommended by their Commanding Officer and Air Ministry Authority is given), re-engage to complete their Colour service to qualify for pension.

Fourteen days' leave will be granted to men re-engaging after completing first continuous service engagement, if the exigencies of the Service permit.

Age.

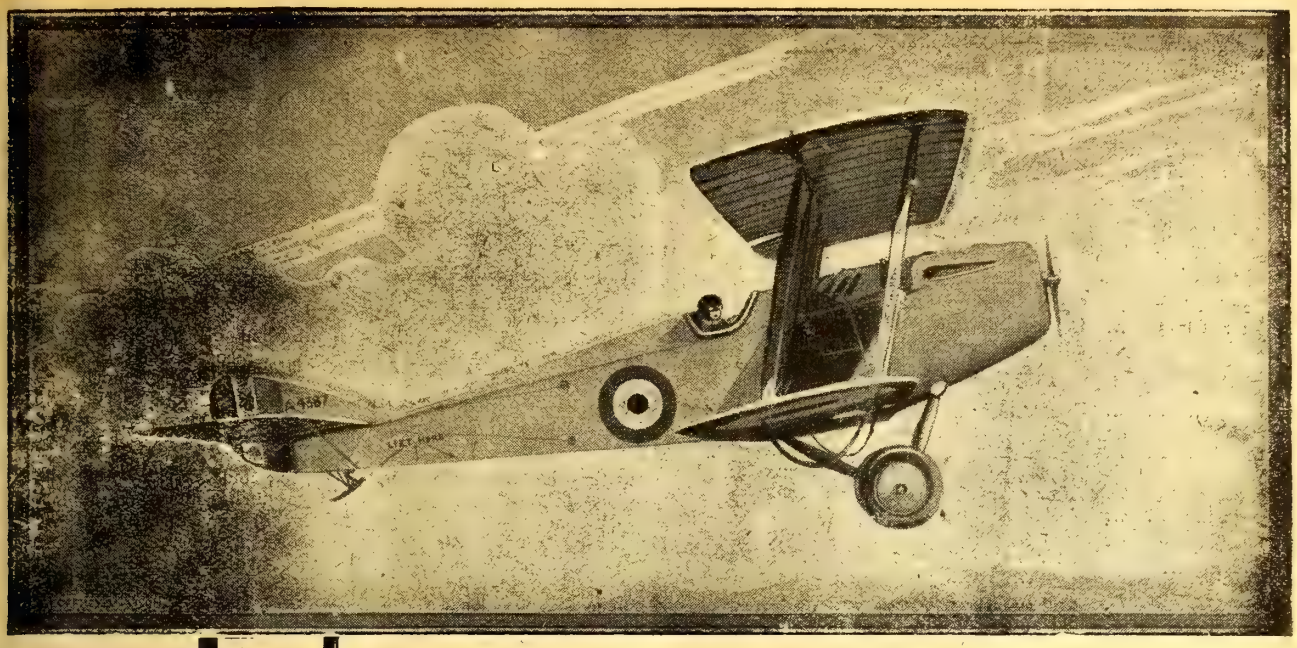
18 to 41 years for Duration of War; the maximum may, in special cases, be increased to 50 years.

18 to 25 years for Normal Period.

Candidates for Normal period of service are subject to examination by a Royal Air Force Medical Officer before acceptance.

Applications for enlistment should be made personally or by letter, stating full particulars, including age and trade to the Royal Air Force Reception Depot (see next page) nearest to the residence or place of Registration of the applicant.

Men are required for the following trades and employments:



Technical.

Acetylene welder	Millwright
Armourer	Motor body builder
Blacksmith	Motor boat coxswain
Boat builder	Moulder
Camera repairer	Observer
Carpenter	Packer
Coppersmith	Painter
Draughtsman	Pattern-maker
Driver—	Photographer
Motor-boat	Pilot
Petrol	Propeller maker
Steam	Rigger (aeroplane)
Electrician	,, (airship)
Fitter—	Tinsmith and sheet metal
Aero engine	worker
General	Turner
Mechanical transport	Upholsterer
Jig and tool makers.	Vulcaniser
Hydrogen worker	Winch driver and fitter
Instrument repairer	Wireless mechanic
Kite balloon telephonist	Wireless operator
Magneto repairer	

These will, if suitable, be appointed in the Royal Air Force, according to ability, as follows:—

Rank.		Daily rate of pay. s.	d.
Air Mechanic, 3rd Class	Commencing rate of pay	2	0
Air Mechanic, 2nd Class	Commencing rate of pay	3	0
	After 3 years' service in the rank	3	6
Air Mechanic, 1st Class	Commencing rate of pay	4	0
	After 3 years' service in the rank	4	6
	After 6 years' service in the rank	5	0
Rising on Promotion to—			
Corporal Mechanic ...	Commencing rate of pay	5	0
	After 3 years' service in the rank	5	6
	After 6 years' service in the rank	6	0
Sergeant Mechanic ...	Commencing rate of pay	6	0
	After 3 years' service in the rank	6	6
	After 6 years' service in the rank	7	0
Chief Mechanic	Commencing rate of pay	7	0
	After 3 years' service in the rank	8	0
	After 6 years' service in the rank	9	0
Master Mechanic ...	(9s. + 2s. skill pay)	11	0
Chief Master Mechanic	(9s. + 3s. skill pay)	12	0

In addition, Free Kit, Food and Lodging on the various scales laid down from time to time for peace and war conditions.

MARTINSYDE

Aerodrome - and Auxiliary Works:
BROOKLANDS.

Head Office & Works:
WOKING, Surrey.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

NON-TECHNICAL.

Aerial gunner	Hospital orderly
Assistant armourer	Labourer
Batman	Packer's mate
Butcher	Painter's mate
Cook	Motor cyclist
Coppersmith's mate	Shoemaker
Disciplinarian	Tailor
Fabric worker	Telephone operator

These will, if suitable, be appointed in the Royal Air Force, according to ability, as follows:—

Rank.		Daily rate of pay. s.	d.
Private, 2nd Class ...	Commencing rate of pay	1	6
Private, 1st Class ...	Commencing rate of pay	1	8
	After 3 years' service as a private over 18 years of age	2	0
RISING ON PROMOTION TO—			
Corporal	Commencing rate of pay	2	4
	After 3 years' service in the rank	2	6
Sergeant	Commencing rate of pay	3	3
	After 3 years' service in the rank	3	5
	After 6 years' service in the rank	3	7
Flight-Sergeant	Commencing rate of pay	3	10
	After 3 years' service in the rank	4	1
	After 6 years' service in the rank	4	4
Sergeant-Major, Class II		6	9
Sergeant-Major, Class I		7	6

In addition, Free Kit, Food and Lodging, on the various scales laid down from time to time for peace and war conditions.

(For Separation and Dependants' Allowances and Pensions, see table at foot of page.)

All Learners will be entered in the "Non-Technical" Category and be re-mustered to the "Technical" Category when sufficiently qualified to be able to pass the prescribed examination.

CLERKS AND STOREMEN.

These will, if suitable, be appointed in the Royal Air Force, according to ability, as follows:—

Rank.	Daily rate of pay. s.	d.
Clerk, 3rd Class	1	8
Clerk, 2nd Class	2	0
Clerk, 1st Class	3	0
RISING ON PROMOTION TO—		
Corporal Clerk	4	0
Serjeant Clerk	4	9
Flight Clerk	5	6
Master Clerk (1st Class Warrant Officer)	6	9

In addition, Free Kit, Food and Lodging, on the various scales laid down from time to time for peace and war conditions.

(For Separation and Dependants' Allowances and Pensions, see table at foot of page.)

WAR PAY.

War Pay at 1d. a day for each year of service rendered since the commencement of the war will, subject to good conduct, be given to Privates 2nd Class, and Clerks 3rd Class only.

PEACE CONDITIONS.

A married establishment will probably be determined, but conditions cannot be stated in detail until the general policy after the war in this respect has been determined.

Promotions and the consequent increases of pay are rapid at the present time, subject only to skill and the behaviour of the men. For this reason Good Conduct Badges with pay will not be awarded to members of the Royal Air Force.

PENSIONS.

Have not yet been determined; it may, however, be taken for granted that the amounts payable will not be less than those awarded to men who have qualified for pensions in the Army.

BOYS.

The Royal Air Force will be open to receive boys from time to time for long service only, between the ages of 15 and 17 years.

PERIOD.

(a) 8 years with the Colours, including period served prior to attaining the age of 18 years and 4 years on the Reserve.

(b) Six months before the termination of 8 years' service with the Colours, they may, if recommended by their Commanding Officer and Air Ministry Authority is given, re-engage to complete their Colour Service to qualify for Pension.

RATE OF PAY.

1s. per diem with free kit, food, etc., and war pay at 1d. a day for each year of service rendered during the war, subject to good conduct. On attaining the age of 18 years Boys will be appointed 3rd Class Air Mechanics at 2s. per diem.

Boys will have an opportunity of learning a trade, which should be useful to them on their discharge.

All boys have to attend Divine Service at least once each week.

Boys are housed together under specially selected Disciplinary Non-Commissioned Officers.

The regular working hours for Boys do not exceed 48 hours per week. In the case of Boys under 17, they do not exceed 40 hours per week.

Systematic arrangements are made for the Boys' education, recreation and amusements.

MEDICAL CLASSIFICATION.

Grade 1 only.

Applications for enlistment should be made by letter, stating full particulars, including trade (if any). The following certificates will be required before completion of enlistment:—

1. Written consent of Parents or Guardians, duly witnessed.
2. Certificate of good moral character from clergyman.
3. Certificate of Birth.
4. Certificate of Schoolmaster of having passed Standard VI. or an educational equivalent thereto.

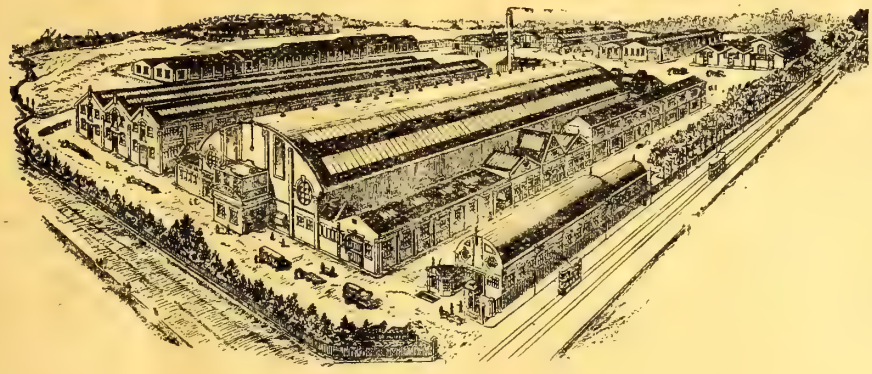
Applications should be made to the Royal Air Force Reception Depôt (see below) nearest to the residence or place of registration of the applicant.

No person is eligible for enlistment into the Royal Air Force unless he is a natural born British subject and the son of natural born British subjects.

ROYAL AIR FORCE RECEPTION DEPÔTS.

No. 1.—40, Upper Brook Street, Mayfair, London, W.1.
No. 2 (a).—8, Tyndall's Park Road, Bristol.
No. 2 (b).—12, Newport Road, Cardiff.
No. 3.—Carlton Chambers, Paradise Street, Birmingham.
No. 3 (a).—Midland Bank Warehouse, King Street, Nottingham.
No. 3 (b).—117, Mount Pleasant, Liverpool.
No. 4 (a).—6, Portland Crescent, Leeds.
No. 4 (b).—10, Sydenham Terrace, North Road, Newcastle-on-Tyne.
No. 5.—9, Somerset Place, Sauchiehall Street, Glasgow.

SEPARATION AND DEPENDANTS' ALLOWANCES.—WAR RATES.



Married men joining and separated from their families will receive weekly allowances of which some typical cases are given below:

	Wife only. s.	d.	Wife and 1 child under 14. s.	d.	Wife and 2 children under 14. s.	d.	Wife and 3 children under 14. s.	d.	Wife and 4 children under 14. s.	d.	Remarks.
Private and Corporal	12	6	19	6	24	6	28	0	31	0	3s. each additional child
Serjeant (including Flight-Serjeant)	15	0	22	0	27	0	30	6	33	6	Ditto.
Warrant Officer, Class II	22	0	27	0	30	6	32	6	34	6	2s. for fifth child, 3s. each additional child.
Warrant Officer, Class I	23	0	28	0	31	6	33	6	35	6	2s. for each fifth and sixth child, 3s. each additional child.

NOTES.

1. Under certain conditions the above rates are increased by 3s. 6d. a week in the case of wives resident in the London area.
2. The rates for children over 14 are less.
3. The weekly rates for motherless children are:—
   Under 14 years of age.—For each child, if each is in the care of a separate guardian, 7s. Where two or more children of the same family are in the care of one guardian, 7s. for the first and 6s. for each other child.
   Over 14 years of age.—For each entitled child, 5s.
4. Other dependants.—In the case of dependants to whom the individual is bound by some natural tie, and who are found as a fact to have been wholly or partly dependant on him before enlistment, the amount which the individual used to pay to support the dependant is ascertained and paid as separation allowance, subject to certain limits. Fuller particulars can be obtained from any Post Office or Local War Pensions Committee.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

R.F.C. LOSSES IN THE RETREAT.

The "Daily Telegraph" of April 4th says:—

"A word or two as to the position in the air, and the special effort Germany is reported to be making to get level with us in aerial fighting. Undoubtedly the enemy has concentrated all his available strength in this arm on the battle front, whilst we have been at some disadvantage as a result of having lost in the retirement a certain number of our advanced aerodromes

"As a consequence, the balance of loss has been more equal in the last three or four days than at the outset of the battle, when unquestionably we were very much on top. It is the opinion of a military expert that although we have definitely secured a superiority in the air so that we inflict more losses on the enemy than he inflicts on us we are a long way from having obtained what is called 'the command of the air.' That is to say, the enemy is still able to photograph our positions, etc., but it is the fact that we can always do more."

The loss of an aerodrome means the loss of all machines under repair, and of spare parts, stores, etc., so that it means putting a number of aviators out of action for the time being. This loss can be made up fairly quickly from home, at the present rate of output, but it should be impressed on all aircraft workers that present output is laid down to supply the present rate of expansion of the Air Force, and that an extra effort is needed to make good the losses.

The real danger is the amount of overwork which is cast on the remaining aviators who have not been demobilised by loss of matériel. This overwork is bound to cause an increased rate of casualties, especially among the fitter and more experienced men, who will naturally take on themselves the task of making good the shortage.

Thus one finds once more how absolutely interdependent are all branches of the Army, and how unwise it was to fiddle with alteration in the R.F.C. while their aerodromes were burning.—

C. G. G.

THE HUN BOMBING POLICY.

The "Daily Express" of April 4th says:—

"The Hamburg 'Nachrichten' is the journal which foreshadows the new menace from the clouds:—

"Our enemies have hitherto tried in vain to beat off the German air attacks, and our losses in machines have been extraordinarily insignificant. This is a success which in view of the strong British defence can only be called brilliant.

"We Germans may regard with pride and confidence the future of the war in the air. German technical skill will before long make short work of the English and French anti-aircraft weapons, and the day is not very distant when a simultaneous attack on London and Paris will be made of such formidable power than half those cities will be laid in ruins.

"On that day there will arise such a stupendous cry for peace among the English and French people that their present rulers will be compelled to obey the command of the popular clamour or risk their necks."

One is glad to see this testimony to the strength of the L.A.D.A. work. Success, however, is to be measured by results and not by insignificance of loss. Attacking forces which retire without pushing their attack home may well avoid losses, and the success in such case is with the defenders.

It is well to remember, however, that since the "moonless" raid some six weeks or so ago there has been only one night on which a raid from Flanders has been possible. Fog or adverse wind has prevailed every other night on the other side of the Channel. Consequently we again owe our chief defence to our good old English weather, which defeated the Spanish Armada.

At the same time, it is only fair to assume that during that period considerable strides have been made in strengthening the London defences; in fact, one may safely say that one is confident that such is the case. One might assume also that the Hun has been increasing his bombing fleet during the same period. But it seems probable that the increase is not so great in proportion because of the number of bombing machines which he has used up in operations in France, and because of the employment of aeroplane and engine factories in building fighting and reconnaissance machines for the battle areas.— C. G. G.

THE OTHER BIG PUSH.

In the midst of all our troubles it is comforting to learn that Aircraft Production is going ahead in a highly satisfactory manner. It may be impossible at short notice to reorganise so vast a concern as the Hotel Cecil and replace all the inefficient members of the staff by efficient people, and to abolish the old clogged system by one which works on forced-feed bearings. But there is no doubt that the new régime is pushing most work at a rapidly increasing rate.

Nowhere has Sir William Weir's system of selecting men of experience and ability to speed up production been more successful than in the department concerned with engines, and nowhere has his ability in choosing the right men for the various jobs been more remarkable. In two specific instances recently—one of which has been apparently the subject of ill-informed criticism—engineers of great experience, and of notable achievement, have been induced to leave work in which they have produced excellent results, in order to push along, or out, the mass of inefficient officialdom at the Air Ministry. Already one of them has proved that he will make good. In the other instance the official's record in producing record output from a solid old firm of the most conservative English type gives one complete confidence in his ability to increase still further the production of engines.

Active service people who continually feel anxious lest they and their subordinates should be let down by the people at home will be interested to learn that the Big Push on the Strand Front is progressing rather better than "according to programme."—

C. G. G.

A NEW APPOINTMENT.

The Secretary of State for the Royal Air Force has appointed Mr. W. A. Bland, Director of Departmental Finance, War Office, to be Assistant Financial Secretary in the Air Ministry.

BRAZIL AND THE WAR.

The following telegrams have been exchanged between the King and Dr. Wenceslau Braz, President of the Republic of Brazil:—

Brazilian President to the King:—

Brazil follows with the keenest emotion and firm confidence the courageous resistance of the English Army in the face of the present enemy offensive.

It is in this critical moment for the Allied arms that I think it opportune to reaffirm once more to your Majesty the solidarity of Brazil in the cause of the liberty of nations, and the early departure of our Fleet for European waters, thus sharing, within the measure of our powers, in the perils of war.

The King's reply:—

I most deeply appreciate the reaffirmation by your Excellency, at this great crisis, of Brazil's devotion to the cause of the Allies.

The British Navy looks forward with profound satisfaction to the co-operation of Brazilian warships, and Brazilian airmen are receiving an enthusiastic welcome from the Royal Air Force.

Your Excellency's message will be an encouragement to my brave troops engaged in the present violent battle, as well as to us all to persevere in securing, by complete victory, the liberty of nations.

FOR N.C.Os. AND MEN.

Ever-increasing aerial activity at the front, and the increase in the employment of N.C.Os. and men as observers and machine gunners, is resulting in heavier demands on the Royal Flying Corps Families' Relief Fund, which was founded by the Aerial League to give immediate temporary help to the dependants of N.C.Os. and men of the R.F.C. killed on active service.

Maj.-Gen. H. Arbuthnot, the chairman, writes to say that the fund is now getting very low, and he appeals for subscriptions.

These should be sent to the hon. treasurer of the fund, at the Aerial League's Offices, 46, Dover Street, Piccadilly, W.1.

NEW PHRASEOLOGY.

Aviation has been responsible for the introduction of many new and quaint words and phrases, many of which have passed into the language. "Blimp," "Hickboo," "Spikebozzle," and "Crosswaffle" are among them. All these are without etymology and are purely onomatopœic. Among newer efforts the nicknames "The Hotel Bolo," "Bolshevik Mansions," "Soviet Chambers," and "Trotsky Rents" as applied to certain Government offices have their merits as humorous efforts.

Quite the latest, however, is the coining of certain new verbs to express acts familiar to all who have to work among the intrigues of officials in general. One is therefore justified in publishing the first of the new series, because after a time such phrases crop up without anyone knowing who was originally responsible for them. Here are the three first:—

"To Balb," or "To Commit Balbery":—To short-circuit; to intrigue against; to build a wall round someone, so as to make him inaccessible to information or incapable of wielding power; to freeze out.

"To Josh":—To upset attempts made to balb.

"To Counterbalb":—To use the attempts or stones of the man who is building a wall round one for the purpose of building a wall round him.

The derivations of the above are obviously from Balbus who builed a wall and Joshua who blew one down with a blast.

The idea, but not the words, comes originally from the Americans, who talk of a man having a wall built round him when he no longer has any power, or no longer knows what is going on. The expression was found a bit too long for ordinary conversation. Hence the effort to produce efficiency by finding a suitable synonym.

GAS.

A man and girl were injured by a gas explosion in the Hotel Cecil on Friday, April 5th. It is stated that the gas escaped in the kitchen, which is in the basement.

It is understood that a number of people have suffered moral and intellectual damage, if not physical injury, from analogous causes in more exalted positions.

NAVAL and MILITARY AERONAUTICS

FROM THE "LONDON GAZETTE."

Admiralty, March 26th.

R.N.A.S.—Flt. Lt. to be Flt. Comdr.:—R. G. Mack, June 30th, 1917.

War Office, April 2nd.

REGULAR FORCES.—R.F.C.—Mil. Wing.—Gen. List: Temp. Serjt.-Maj. H. Jones, from R.F.C., to be temp. Sec. Lt. (March 31st).

* * *

The King has been pleased to approve of the award of the Victoria Cross to the following officer:—

Sec. Lt. (Temp. Capt.) James Byford McCudden, D.S.O., M.C., M.M., Gen. List and R.F.C.

For most conspicuous bravery, exceptional perseverance, keenness, and very high devotion to duty.

Capt. McCudden has at the present time accounted for 54 enemy aeroplanes. Of these 42 have been definitely destroyed, 19 of them on our side of the lines. Only 12 out of the 54 have been driven out of control.

On two occasions he has totally destroyed four two-seater enemy aeroplanes on the same day, and on the last occasion all four machines were destroyed in the space of 1 hour and 30 minutes.

While in his present squadron he has participated in 78 offensive patrols, and in nearly every case has been the leader. On at least 30 other occasions, whilst with the same squadron, he has crossed the lines alone, either in pursuit or in quest of enemy aeroplanes.

The following incidents are examples of the work he has done recently:—

On December 23rd, 1917, when leading his patrol, eight enemy aeroplanes were attacked between 2.30 p.m. and 3.50 p.m. Of these two were shot down by Captain McCudden in our lines. On the morning of the same day he left the ground at 10.50 and encountered four enemy aeroplanes; of these he shot two down.

On January 30th, 1918, he, single-handed, attacked five enemy scouts, as a result of which two were destroyed. On this occasion he only returned home when the enemy scouts had been driven far east; his Lewis gun ammunition was all finished and the belt of his Vickers gun had broken.

As a patrol leader he has at all times shown the utmost gallantry and skill, not only in the manner in which he has attacked and destroyed the enemy, but in the way he has during several aerial fights protected the newer members of his flight, thus keeping down their casualties to a minimum.

This officer is considered, by the record which he has made, by his fearlessness, and by the great service which he has rendered to his country, deserving of the very highest honour.

Air Ministry, April 2nd.

By an Order in Council the following officers are attached to the Royal Air Force:—

All officers holding permanent commissions in the Navy or Royal Marines or commissions other than temporary in the Royal Naval Reserve or Royal Naval Volunteer Reserve who on April 1st, 1918, belonged or were attached to the Royal Naval Air Service.

All officers holding permanent commissions in the Regular Forces or commissions in the Reserve of Officers, the Special Reserve (except Royal Flying Corps Special Reserve), Territorial Force or Territorial Force Reserve who belonged or were attached to the Royal Flying Corps.

All officers holding permanent commissions in the Indian forces who on April 1st were attached to the Royal Flying Corps.

The period for which those officers will be so attached will be the period of the war or four years, whichever may be the longer, unless the Air Council arrange with the Admiralty or Army Council for the return of an officer to the naval or military service before that time. The period, however, for which an officer who has been attached to the Royal Naval Air Service or to the Royal Flying Corps is attached to the Air Force shall in no case exceed such period as will complete the period for which he was attached to the Royal Naval Air Service or the Royal Flying Corps.

The following officers, warrant officers, petty officers, non-commissioned officers, and men are by the Order transferred to the Air Force:—

All other officers, all warrant officers, petty officers, non-commissioned officers and men of the naval or military forces (other than forces raised and provided by any part of his Majesty's Dominions outside the United Kingdom) who on April 1st belonged or were attached to the Royal Naval Air Service or the Royal Flying Corps.

All officers holding temporary commissions on the general list of the Indian forces and all officers of the Indian Army Reserve who on April 1st were attached to the Royal Flying Corps.

Any person transferred or attached to the Air Force by virtue of the Order may, within three months from the time when he receives notice of such transfer or attachment, give notice to his commanding officer that he does not desire to be transferred or attached, and the transfer or attachment will be annulled.

All officers serving with the Royal Naval Air Service and Royal Flying Corps on March 31st, 1918, or in connection with those services in certain Government departments, in other than the following capacities, are granted temporary commissions in the Royal Air Force, with effect from April 1st, 1918, in ranks which will appear in the Royal Air Force List.

In view of the special circumstances incident to the inception of the Royal Air Force these ranks must be regarded as subject to revision as circumstances may require until confirmed by the actual issue of the commission.

The exceptions are as follows:—

Certain officers of the Royal Navy whose services are only lent temporarily to the Royal Air Force.

Certain Accountant Officers, Royal Navy.

Officers under instruction, other than those holding commissions or appointments in the Royal Flying Corps.

Officers i/c Messing, other than those holding commissions or appointments in the Royal Flying Corps.

Officers serving with cadet units, other than those holding commissions or appointments in the Royal Flying Corps.

Liaison Officers, other than those holding commissions or appointments in the Royal Flying Corps.

Medical Officers and Chaplains.

Quartermasters, other than those holding commissions or appointments in the Royal Flying Corps.

* * *

The following appointments have been made at the Air Ministry:—

Dep. Master Gen. Pers.—Lt.-Col. (temp. Brig.-Gen.) G. Livingston, C.M.G., and to retain his temp. rank whilst so empld. (April 1st.)

Directors.—Maj. H. S. Ebben, O.B.E., and to be temp. Col. whilst so empld. (Feb. 18th); Lt.-Col. (temp. Col.) R. M. Groves, D.S.O., and to be temp. Brig-Gen. whilst so empld. (April 1st); Lt.-Col. (temp. Brig.-Gen.) J. G. Hearson, D.S.O., and to retain his temp. rank whilst so empld. (April 1st).

Deputy Directors.—And to be temp. Col. whilst so empld., if not already holding that rank:—Maj. (temp. Lt.-Col.) C. D. Breese, Maj. (temp. Lt.-Col.) C. L. Courtney, Maj (temp. Lt.-Col.) T. E. St. C. Daniell, M.C., Maj. (temp. Lt.-Col.) E. H. Davidson, Lt.-Col. (temp. Col.) J. D. Mackworth, Maj. (temp. Lt.-Col.) R. H. More, C.M.G. (graded for purposes of pay as S.O., 1st Cl.), Maj. (temp. Lt.-Col.) Hon. W. F. F. Sempill (Master of Sempill) (April 1st).

S.O., 1st Class.—And to be temp. Lt.-Col. whilst so empld., if not already holding that rank:—Maj. A. ap Ellis, Maj. (temp. Lt.-Col.) R. H. Austin-Sparks, Sec. Lt. W. C. Bersey; Lt.-Col. H. T. A. Bosanquet, Capt. R. B. Bourdillon, M.C., Lt.-Col. G. T. Brierley, D.S.O., Maj. (temp. Lt.-Col.) G. R. Bromet, D.S.O., Lt. (temp. Capt.) H. A. Browne, Maj. D. H. Cameron, Lt.-Col. A. D. Carden, Maj. (temp. Lt.-Col.) T. W. C. Carthew, D.S.O., Capt. E. G. H. Clarke, M.C., Maj. (temp. Lt.-Col.) B. S. Foster, Maj. M. Freeman, Capt. H. G. Gold, Maj. G. D. Hannay, Maj. (temp. Lt.-Col.) G. R. A. Holmes, O.B.E., Capt. (temp. Maj.) C. Jarrott, O.B.E., Lt.-Col. F. H. Kirby, V.C., Lt. (temp. Capt.) O. W. Latimer, Maj. Sir N. A. R. D. Leslie,

Waylen, Capt. L. M Wells-Bladen, Lt. (Hon. Capt.) W. T. Williams, Lt. (Hon Capt.) C. S. Willmott, Capt. S. M. Wood, April 1st.

S.O., 4th Class, and to be temp. Lts. whilst so empld., if not already holding that rank:—Sec. Lt. G. F. Allison, Lt. B. D. Bellamy, Lt. (temp. Capt.) H. Cox, Sec. Lt. A. G. O. Ellis, Lt. (temp. Capt.) R. D. Hallam, Capt. J. F. Hedley, Lt. H. W. Hern, Sec. Lt. R. C. J. Hervey, Lt. C. J. S. Holden, Sec. Lt. H. B. Langton, Sec. Lt. (Hon. Lt.) E. Laurie, Lt. J. E. Pike, Lt. J. G. Spencer, Sec. Lt. H. J. Taplin, Sec. Lt. J. E. Tod, Sec. Lt. D. A. Tullis, April 1st

War Office, April 3rd.

REGULAR FORCES.—Staff.—Graded for purposes of pay as Staff Lt., 3rd Cl.—Temp. Sec. Lt. (on prob.) G. A. I. Bosanquet, R.F.C., Gen. List, March 4th.

The King has been pleased to approve of the award of the Military Medal to the following man:—

64937 2nd. Cl. A. Mech. H. Blair, R.F.C. (West Kilbride).

War Office, April 4th.

Memorandum.—His Majesty the King has been graciously pleased to approve of the appointment of Lt. Gen. Sir D. Henderson, K.C.B., D.S.O., as Col. of the High. L.I., March 3rd.

War Office, April 5th.

REGULAR FORCES.—Staff.—Special Appointments.—(Graded for purposes of pay as Staff Lts., 3rd Cl.).—Temp. Sec. Lt. H. G. L. Thompson, R.F.C., and to be transfd. to Gen. List, Jan. 25th.

Establishments.—R.F.C.—Mil. Wing.—Flt. Comdrs.—From Flying Officers, and to be temp. Capts. while so empld.:—Temp. Sec. Lts., Gen. List, H. B. Bell, Feb 23rd; P. Carpenter, M.C., P. Wilson, Feb. 27th.

Flying Officer.—Lt. (temp. Capt.) F. McQuistan, R.F.A., T.F., reverts from a Flt. Comdr. and relinquishes his temp. rank, March 8th, sen. from June 26th, 1916.

Adj.—Capt. C. V. Mercer, E. Kent R., Spec. Res., from March 15th, to Dec. 18th, 1917.

Gen. List.—To be temp. Sec. Lts.:—1st Cl. Air Mech. S. F. Woods, from R.F.C., Dec. 7th, 1917; 1st Cl. Air Mech. E. G. Amatt from R.F.C., Dec. 15th, 1917; 1st Cl. Air Mech. C. Oxberry, from R.F.C., Dec. 20th, 1917; Flt. Serjt J. Hogan from R.F.C., Dec. 20th, 1917; Temp. Serjt.-Maj. C. A. Corbeaux, from R.F.C., March 11th.

Air Ministry, April 5th.

R.A.F.—The following appointments are made at the Air Ministry:—

S.O., 1st Cl.—The notification in the "Gazette" of April 2nd, 1918, concerning Lt.-Col. F. H. Kirby, V.C., is cancelled.

S.O., 2nd Cl.—Maj. Hon. M. Baring, Capt. (temp. Maj.) The Hon. Sir J. A. Simon, K.C.V.O., April 1st.

S.O., 3rd Cl.—Lt. (temp. Capt.) W. P. Groves, April 1st. The rank of Capt. C. F. O. Master is as now described, and not as in the "Gazette" of April 2nd.

Memoranda.—Col. C. L. Lambe, C.M.G., D.S.O., to be temp. Brig.-Gen. whilst commanding a Brig., April 1st.

J. de M. Hutchison, C.V.O., C.M.G. (Vice-Admiral, R.N.) to be temp. Col., with the hon. rank of Lt.-Gen., April 1st.

War Office, April 6th.

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing—Gen. List.—Temp. Sec. Lt. (temp Lt.) J. Durward, an Equip. Officer, 2nd Cl., to be temp. Capt. while specially empld., Jan. 22nd; 1st Cl. Air Mech. C. G. F. Carver, from R.F.C., to be temp. Sec. Lt., March 3rd.

* * *

With reference to the awards conferred as announced in the "London Gazette" dated Nov. 26th, 1917, the following are the statements of service for which the decorations were conferred:—

The Distinguished Service Order

Temp. Capt. Philip Fletcher Fullard, M.C., Gen. List and R.F.C.—As a patrol leader and scout pilot he is without equal. The moral effect of his presence in a patrol is most marked. He has now accounted for 14 machines destroyed and 18 driven down out of control in a little over four months.

A Bar to the Military Cross.

Temp. Capt. Harry George Ernest Luchford, M.C., Gen. List and R.F.C.—When engaged on a patrol, he and his observer encountered about 15 hostile aeroplanes, and shot one of them down in flames. Later, when engaged on a reconnaissance with three other machines, he encountered eight hostile aeroplanes, and shot one of them down. On another occasion he destroyed one of three hostile scouts which were attacking one of our machines, and also shot down a hostile two-seater.

Sec. Lt. (temp. Lt.) Victor Rodney Stokes White, S. Staffs. R. Spec. Res. and R.F.C.—While acting as observer on an offensive patrol he and his pilot shot down an enemy scout in flames. Later, while on a reconnaissance with three other machines, he and his pilot engaged eight enemy aeroplanes and shot down and destroyed one of them. On another occasion they destroyed one of three hostile scouts and also a hostile two-seater machine.

Lt. (Temp. Capt.) David Sidney Hall, Arg. and Suth'd Highrs. and R.F.C.

While leading back his formation of five machines from a bombing raid he was attacked on eight different occasions by numerous enemy scouts. He himself shot down one in flames and another out of control, while his observer shot down two in flames. He has at all times completed the task allotted to him and set a splendid example.

Capt. Frederic Hope Lawrence, Worc. R., Spec. Res. and R.F.C.

While leading a patrol of eight scouts, which were protecting a number of bombing machines, he attacked 10 enemy machines, driving one down in flames and preventing the bom

ing machines being interfered with. On another occasion he attacked five enemy scouts, bringing one down in flames. He has brought down two other machines, and has at all times shown the greatest coolness and courage.

Temp. Lt. John Smith Michie, Gen. List and R.F.C.

On one occasion he attacked a hostile two-seater machine while it was leaving the ground and forced it to dive. He from a height of 150 ft. dropped his bombs on the machines on the aerodrome, destroying one. His machine was hit in the petrol tank and touched the ground, but he recovered and led his patrol back safely. On another occasion he attacked three hostile scouts, bringing one of them down. He has also carried out numerous actions on enemy troops and led many patrols with great success.

Sec. Lt. James Dennis Payne, Gen. List and R.F.C.

While on patrol with two other scouts he attacked a formation of seven enemy two-seaters, bringing down two himself while the two scouts brought down two more. Besides these, he has accounted for five other machines, and at all times shown the greatest gallantry.

War Office, April 8th.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing. Staff Capt.—Temp. Lt. (temp. Capt.) P. C. Hoyland, Gen. List, from an Adjt., and to retain the rank of temp. Capt. while so empld. (March 6th).

Wing Comdr.—Maj. A. S. W. Dore, D.S.O., Worc. R., T.F., from a Sqdn. Comdr., and to be temp. Lt.-Col. while so empld. (March 12th).

Sqdn. Comdr.—Capt. C. H. Gardner, R.F.A., T.F., from a Flt. Comdr., and to be temp. Maj. while so empld. (March 11th).

Flt. Comdrs.—From Flying Officers :—Capt. W. J. Cairnes, Leins. R., Spec. Res. (Feb. 1st). And to be temp. Capts. while so empld. :—Temp. Sec. Lt. R. P. Fenn, Gen. List (Feb. 22nd); Sec. Lt. H. J. Whittingham, Spec. Res. (March 11th); Temp. L. G. C. Cuthbertson, Gen. List (March 12th); Temp. Sec. Lt. J. E. Wight, Gen. List (March 13th); Temp. Sec. Lt. R. R. Bentley, M.C., Gen. List (March 16th); Temp. Sec. Lt. G. McPherson, Gen. List; Temp. Sec. Lt. T. Colville-Jones, Gen. List (March 17th).

Asst. Instr in Gunnery.—Graded as an Equipment Officer 3rd Cl.—Sec. Lt. H. J. C. White (Oct. 11th, 1917).

Equipment Officers, 1st Cl.—Sec. Lt. (temp. Lt.) S. L. Amor, Spec. Res., from the 2nd Cl. and to be temp. Capt. while so empld. (March 6th).

Schools of Instrn.—Sch. of Technical Training.—Co. Comdr.—Graded as an Equipment Officer, 2nd Cl.—Temp. Lt. H. R. Gregg, E. Surr. R., to be temp. Capt. (without the pay or allowances of that rank,) while so empld., and to be transferred to R.F.C. Gen. List (Feb. 4th).

Gen List.—To be temp. Sec. Lts. :—Cpl. A. Morgan from R.F.C. (Dec. 31st, 1917); Serjt. J. Drew, from R.F.C. (Jan. 7th).

To be temp. Capts. (with pay and allowances as Lt.) while acting as Adjts.—Lt. J. H. Clive, Lond. R., T.F.; Lt. E. R. W. Close, Notts and Derby. R., T.F.; Sec. Lt. D. I. V. Gatty, R.G.A., Spec. Res. (Feb. 9th); Temp. Lt. F. R. Bush, attd. Rif. Bdg. (Feb. 19th).

Memorandum.—Sec. Lt. (temp. Capt.) L. Luker to be Lt. while serving with R.F.C. (Jan. 1st).

FROM THE COURT CIRCULAR.

Windsor Castle, April 6th.

The following had the honour of being received by the King this morning at Buckingham Palace, when his Majesty invested him with the Insignia of—

The Distinguished Service Order and Bar.

Capt. James McCudden, R.A.F.

* * *

The King then conferred decorations as follows :—

The Victoria Cross.

Sec. Lt. (temp. Capt.) James McCudden, R.A.F.

A Bar to the Military Cross.

Capt. Harold Balfour, K.R.R.C. and R.A.F.
Capt. James McCudden, R.A.F.

The Military Cross.

Capt. George Hackwill, R.A.F.
Capt. Geoffrey Hooper, R.E., attd. R.A.F.
Capt. Frederick Huxley, A.F.C.
Capt. William Shakespeare, R.A.F.
Lt. John Bell, R.F.A., attd. R.A.F.
Lt. Jack Broadway, Dorset Regt. and R.A.F.
Lt. Archibald Heaven, R.A.F.
Lt. Eric Steele, Man. Regt., attd. R.A.F.
Lt. Frederick Woodcock, R.G.A. and R.A.F.
Sec. Lt. Albert Frost, R.W. Surrey Regt., attd. R.A.F.
Sec. Lt. Alfred Wright, R.A.F.

OFFICIAL COMMUNIQUES.

MILITARY.

G.H.Q. Communiqués.

April 2nd, 9.28 p.m.—On the 1st instant several long-distance reconnaissances and photographic flights were carried out by aeroplanes. Good visibility enabled much work to be done in conjunction with the artillery, and many hostile batteries were engaged by our guns with observation from the air.

Our low-flying aeroplanes were again active. Over 17 tons of bombs were dropped, and thousands of rounds of ammunition were fired from the air at the enemy's infantry and other targets on the ground.

Hostile aircraft were also active on the southern portion of our front, some of their two-seater machines firing at our troops with machine-guns from a low height.

Ten hostile aeroplanes were brought down and six others were driven out of control. Another German machine was brought down in our lines by our infantry, and two hostile balloons were destroyed by our aeroplanes.

Eleven of our machines are missing.

After dark, our night-flying machines bombed the enemy's railway stations, billets, troops, and transport, dropping many tons of bombs on Cambrai railway station, on a station south-east of Douai, and on the railway line south of that town, as well as on other targets.

All our machines returned.

April 3rd, 9.37 p.m.—On the 2nd inst., although the weather was fine in the areas behind the front, a heavy bank of low clouds hung over the lines and made reconnaissance work difficult.

The enemy's movements on the battle front were watched, however, by low-flying machines, and observation was carried out for the artillery. Hostile troops and transport on the roads were again harassed with bombs and machine-gun fire, over 1,000 bombs being dropped during the day.

The enemy's aeroplanes were fairly active between Albert and Moreuil.

Thirteen German machines were brought down and eight driven down out of control. Three hostile balloons were also destroyed.

Seven of our machines are missing.

At night rain fell continuously until 3 a.m., after which hour 4½ tons of bombs were dropped on hostile billets and troops, our aeroplanes returning to their aerodromes just as dawn was breaking.

During the last fortnight of intense fighting in the air, the assistance rendered by the personnel of the American Air Service attached to the Royal Air Force has been invaluable.

April 4th, 8.55 p.m.—The weather on the 3rd inst. was again unfavourable for flying, but this did not prevent our aeroplanes from making several flights to reconnoitre the battle front and to attack ground targets with bombs and machine-gun fire.

One fight took place during a clear interval between two very large formations of our own and the enemy's machines. Otherwise hostile aircraft were not very active.

Nine German machines were brought down and three others driven down out of control. One hostile balloon was also destroyed.

Five of our aeroplanes are missing.

April 5th.—On the 4th inst., rain and mist greatly interfered with operations in the air. Our aeroplanes, none the less, reported the progress of the battle south of the Somme, and fired into the enemy's troops.

Of the German machines which appeared on this part of the battle front six were brought down by our aeroplanes and one was shot down by our anti-aircraft gunfire.

One of our machines is missing.

Two of our aeroplanes which were reported missing in the communiqués of the last two days have since returned to their squadrons.

About midday on the 5th inst. our aeroplanes dropped 22 heavy bombs on the railway station at Luxemburg. Many of the bombs were seen to burst on the railway and a very large fire was caused.

The anti-aircraft fire encountered was considerable, but all our machines returned.

April 6th, 7.45 p.m.—On the 5th inst., with the exception of a few flights on the battle front, no flying took place owing to the weather. One hostile aeroplane was shot down by our infantry.

April 7th, 9.27.—During the morning of the 6th inst., owing to bad weather, there was only slight aerial activity.

About noon our machines, which had been watching the enemy's movements on the battle front since dawn, reported a concentration of hostile troops south of the Somme. Large formations of our aeroplanes immediately went out in the rain and dropped over 500 bombs on the enemy's assembled infantry, in addition to firing some 50,000 rounds at them with their machine guns.

In air fighting 12 hostile machines were brought down and 1

others driven down out of control. Two German machines also were shot down by anti-aircraft fire.

Sixteen of our machines have not yet been located. Many of these have undoubtedly made forced landings behind our lines owing to the difficulty of finding their aerodromes in the heavy rain.

Throughout the present battle the Canadians in the Royal Air Force have done most valuable work.

April 8th, 8.55 p.m.—On the 7th inst. visibility was good, enabling useful work to be done by our aeroplanes in co-operation with the artillery, but clouds prevented long-distance reconnaissance and photographic flights.

Several good targets were engaged by our low-flying aeroplanes, whose pilots dropped 10 tons of bombs and fired a great many rounds of ammunition upon hostile troops and transport on the battle front.

South of the Somme hostile aircraft were active.

Six of the enemy's machines were brought down in air fighting and nine others driven down out of control. In addition, two other German machines were shot down by our anti-aircraft guns.

Four of our aeroplanes are missing.

During the night five and a half tons of bombs were dropped by us on Douai railway station and Bapaume.

THE CASUALTY LIST.

NAVAL.

Reported April 4th.

Killed.—Johnson, E. W., Aircraftman, 1st Cl., F.17153; Lovelock, H. G., D.S.M., Actg. Air Mech., 1st Gde., J.26402 (Po.); Prior, G. W., Aircraftman, 1st Cl., F.31588.

Reported April 5th.

Accidentally Killed.—Love, Flt. Sub-Lt. H. E., R.N.

Accidentally Drowned.—Mallard, Flt. Sub-Lt. N., R.N.

Died of Injuries.—Oakeshott, Flt. Sub-Lt. L. E., R.N.

Connop, Flt. Sub-Lt. H. A., R.N.

Missing.—Stocker, Flt. Sub Lt. E. C., R.N.

Carroll, Flt. Sub-Lt. J. G., R.N.

MILITARY.

Reported April 2nd.

Previously reported Missing, now reported Killed.—Barbour, Sec. Lt. H. D., R.F.C.

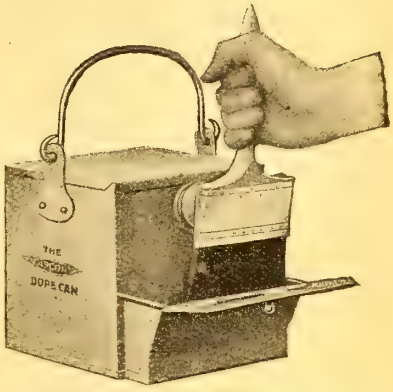
The "Ascol" Dope Can

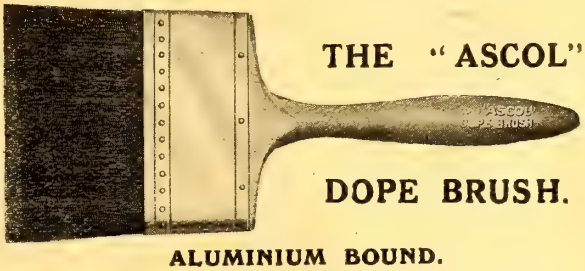


(REGISTERED DESIGN 663,563).

When not in use.

HAS been specially constructed with a view to economising Dope. The brush can be strained before being taken out of the can. The can is easily filled and is constructed to hold the right amount of dope for a morning's work. It is made for hard and rough wear, and will be found exceedingly handy, durable, and invaluable for doping purposes. Can be supplied with manufacturers' own name on can without extra charge.

120/- per dozen.
(Samples at same rate.)



Showing Brush being strained ready for use.

Ready for use.

"ASCOL" LEAFLETS.

Aircraft Manufacturers are invited to write for the Folder of "Ascol" Leaflets dealing with "Ascol" Specialities. They consist of "Ascol" Micrometers, Stools, Engine Brushes. Dope Brushes, Dope Cans, File Cleaners, etc,

THE "ASCOL" DOPE BRUSH.

ALUMINIUM BOUND.

Size - 2in., **2/6**; 4in., 5/-
(Samples supplied at List Prices.)

Specially designed after a careful study of the requirements of Aircraft Manufacturers. They are made of the finest bristles, which are set firmly in the handle.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

The Design and Construction of Internal Combustion Engines, with special reference to Aero Engines.—II.

BY C. SYLVESTER.

Author of "The Conversion of Electrical Machinery," "Testing Motors and Motor Starters," etc., etc.

Thermodynamics.

It is the aim of every designer of prime movers to produce as perfect a machine as is possible, especially in times like the present, when competition is so keen. The two outstanding features which will always recommend a prime mover in the market are:—

1. Low cost of erection and maintenance.
2. Low fuel consumption.

From these features it will be seen that the chief item to be taken into consideration by the designer is the efficient and economical conversion of heat into work.

Heat.

Before it is possible to carry out even the simplest designs it is necessary to have a good knowledge of heat, the methods used to convert it into work, and the technical terms which are essential to the correct understanding of the subject.

In these articles, although we are dealing with the design of internal combustion engines only, it may be said that the same rules follow for internal and external combustion engines. The only difference in the production of the heat is that with internal combustion engines the fuel is burnt inside the engine—to be correct, in the cylinder. And with external combustion engines the fuel is burnt outside the engine.

A steam turbine is a good example of the external combustion engine. Here the fuel is burnt under a boiler, and heat in the shape of steam is conveyed to the turbine by means of pipes.

Heat is sometimes termed temperature. That is, when referring to the amount of heat in a body it is said that the temperature is more hot or cold, as the case may be. Heat may be imparted from a hot to a cold body, but it does not follow that the amount of heat taken from the hot body is transferred to the cold body. Only a percentage of the total quantity will be transferred.

For instance, we will consider for a moment a steel kettle of water on a fire. In this case heat will be transferred from the fire to the metal of the kettle, and again from the metal to the water. Owing to the resistance of the steel and water to heat, a certain amount of heat units will be lost. If a copper kettle were used, owing to the greater heat conductivity of copper over steel a larger amount of heat would be transferred.

The ratio of the heat used and the heat transferred may be said to be the efficiency of the transfer. That is, we will presume that 50 units of heat are used, and 30 units are actually transferred, then the efficiency will be 30 divided by 50, this equals 60 per cent.

The British Thermal Unit.

We now have to consider the unit of heat known as "the British Thermal Unit." This is defined as the quantity of heat necessary to raise the temperature of one pound of water one degree Fahrenheit, the temperature of the water being at the time of maximum density—that is, 39.4 degrees Fahrenheit.

Here it will be seen that we have a comparison between heat and energy. On one hand we have a certain amount of heat, on the other we have the amount of work done by this quantity of heat. The mechanical equivalent to a "B.T.U." is 778lbs. raised one foot, and its electrical equivalent—one kilowatt-hour—is 3,411 B.T.Us.

In the above we are dealing with water, and one desires to point out that the same rules do not apply when dealing with, say, iron or steel. The amount of heat necessary to raise the temperature of the same weight of iron one degree Fahr. would be considerably less than one B.T.U. Here, again, we have "specific heat," which may be described as the amount of heat, in thermal units, necessary to raise any unit mass one degree Fahr.

Although the economical production and transfer of heat is the outstanding aim of the designer, it may be also said that it is the limiting feature of design, since the metals used in actual construction must be of such material strength as to be able to resist, as much as possible, the action of, not only the quantity of heat, but the expansion and contraction that naturally follows the heating and cooling of metals.

It is not possible to produce an alloy or metal that will not expand or contract under the influence of heat, but as some metals expand more or less than others, those materials which expand least should be used in the construction of parts that are subjected to increase of temperatures, providing, of course, that the mechanical strength, the nature of the metal, and the heat-resisting properties are satisfactory.

Comparative Temperatures.

The subject of heat is as interesting as it is extensive, but for our purpose it is not necessary to have more than a good general knowledge of the subject. To further this end and to simplify the subject it is well to study the diagram in Fig. 1, which is almost self-explanatory. This, with a few brief comments on high and low temperatures, will give the student a clear understanding of the relative terms.

The base line of Fig. 1 is "absolute zero," that is, —273 degrees Centigrade. Thermodynamically speaking, at this temperature everything is dead, or at least it is without motion or energy. This condition has never really been reached, but it has been very nearly approached. In this state, barely 1.6 degrees from absolute zero, hydrogen is frozen and helium gas becomes liquid.

At —200 degrees air is liquid, but certain forms of bacteria have been known to survive this temperature. At a temperature of —40 degrees other forms of life exist. In the Arctic regions, where the temperature never rises above —5 degrees, but is often as low as —40 degrees, bird life exists

At 37 degrees Centigrade, the temperature of warm-blooded animals, life thrives on this planet, but if we go a little higher, say to 63 degrees, the boiling point of water, then all life ceases to exist.

At 525 degrees all matter commences to assume a visible glow, and at 800 degrees all magnetism, and, therefore, the source of electrical energy, ceases to exist.

When a temperature of 1,000 degrees is reached, thirty of about fifty known metals are molten, while at 2,000 degrees nearly all substances known to us are gaseous or molten. At 2,700 degrees all matter in the air is vaporised or is liquid.

If we ascend another 300 degrees we approach the temperature at which tungsten melts, and at about 3,700 degrees carbon, which has no true melting point, commences to evaporate.

Above these temperatures there are only two of the fundamental properties of matter that remain constant and unmodified—inertia and weight. The kinetic energy of a unit mass of matter moving with a given velocity remains the same as at ordinary temperatures. That is, the earth will attract the mass with the same force, no matter what the temperature may be.

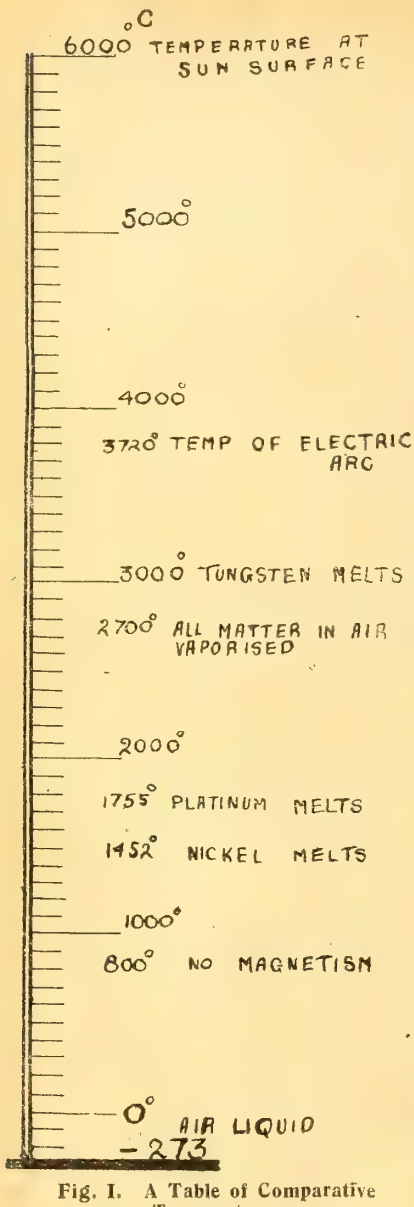

Fig. I. A Table of Comparative Temperatures.

The Part Played by the Heat.

From the above it will be seen that the effect of heat on metals and gas plays a very important part in the design and construction of internal combustion engines. As far as the metals are concerned, mechanical strength, together with the expansion and contraction and the suitability of these metals for their respective functions, have to be carefully considered.

With gases it is essential that the laws governing their expansion should be clearly understood, as the volume that a gas occupies depends upon the temperature and the pressure to which it may be subjected. These laws are explained by Charles and Boyle as follows:—

Charles' Law.

All gases expand equally when heated at constant pressure, and for every degree Centigrade, the expansion is 1/273 part of its volume at 0 degrees Centigrade.

Boyle's Law.

Boyle's law states, "The product of the pressure into the volume of a given mass of perfect gas remains constant, so long as the temperature of the gas is unchanged."

Expansion of Gas.

The expansion curve, Fig. 2, clearly illustrates the relation between the volume and the pressure of a certain mass of gas maintained at a constant temperature. In this diagram at the point A, P and V represent the respective pressure and volume of a mass of gas.

If the pressure falls to P_1, then the volume is increased to V_1.

The internal energy of a gas depends upon its temperature, and it may be said that a gas may be heated in two ways:—

1. At constant pressure, the volume varying.
2. At constant volume, the pressure varying.

Here, again, we have specific heat at constant pressure, and also specific heat at constant volume. The former may be said to be the amount of heat necessary to raise the temperature of one pound of gas one degree, "the pressure remaining constant," and the latter is the amount of heat necessary to raise the temperature of one pound of gas one degree, "the volume remaining constant."

Fig. II.

A Simple Example.

When gas is heated at a constant pressure the temperature increases, but work has to be done before the volume will increase. This is quite clear if we glance at Fig. 3 which represents a cylinder with one end open. In this diagram Pn. is a piston, the original position of which is indicated by the dotted lines. We will now presume that the space P encloses a given volume of gas.

If this gas is heated with the piston firmly held in its original position, no external work will be done. The heat given to the gas, however, raises the temperature and pressure thus increasing the internal energy. Now if Pn. be released it will move towards the end of the cylinder as shown, the actual distance depending upon the pressure of the gas.

In this diagram the cylinder is shown open at one end to avoid air compression, and it must be presumed that the piston is frictionless.

The specific heat of a gas at constant pressure is greater than the specific heat at constant volume, therefore to maintain a constant pressure the volume must increase.

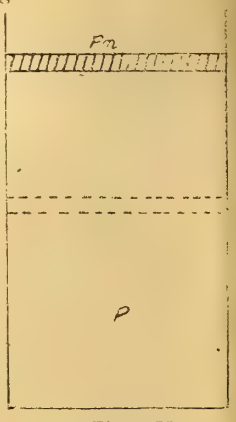

Fig. III.

If it were possible for a gas to expand without doing external work, or without taking in or giving out heat, then there would be no change in its temperature.

In Fig. 3 the actual power in foot pounds may be expressed as P x V, that is, where P is the pressure in pounds per square foot, and V is the volume in cubic feet.

In these articles it is not necessary to go into intricate mathematical details concerning "*Isothermal*" and "*Adiabatic*" expansion. Just sufficient details to give the student a clear understanding of these terms will meet the case.

Isothermal expansion may be best defined as expansion where there is no change of temperature. That is, the amount of work done will be equal to the heat supplied.

When referring to *Adiabatic* expansion it may be said that the internal energy of the gas is converted into work, and as the energy is expended the temperature is lowered.

From this it will be seen that, as isothermal expansion occurs at a constant temperature, and adiabatic expansion is in proportion to the internal heat units, if curves are taken of the respective expansions, the adiabatic curve will fall below that of the isothermal, that is, for a mass of gas of a given volume and pressure.

(To be continued.)

CO-OPERATIVE RESEARCH.

Coventry, March 24th, 1918.

Sir,—I am very interested in the series of articles which have been running in The Aeroplane on Co-operative Research, and I quite agree with every word that has been written. It is high time that a Research Association were formed of men who thoroughly understand their business. There could only be one result, and that is efficiency in every branch of aero work.

The high status of the general engineering trade has only been reached through research carried out at a time when it was necessary. As an example I suggest the steam engine. Time has proved that the old triple expansion sets manufactured by the immortal Bellis and Morcom are worse than useless when compared with the present-day turbine. Yet, the steam engine was very welcome as a prime mover, and it was only research in the right direction that enabled us to throw it on one side and adopt something better.

Thus it is with aero work. I really believe that the present design of aero engine and plane can be considerably improved.

C.S.

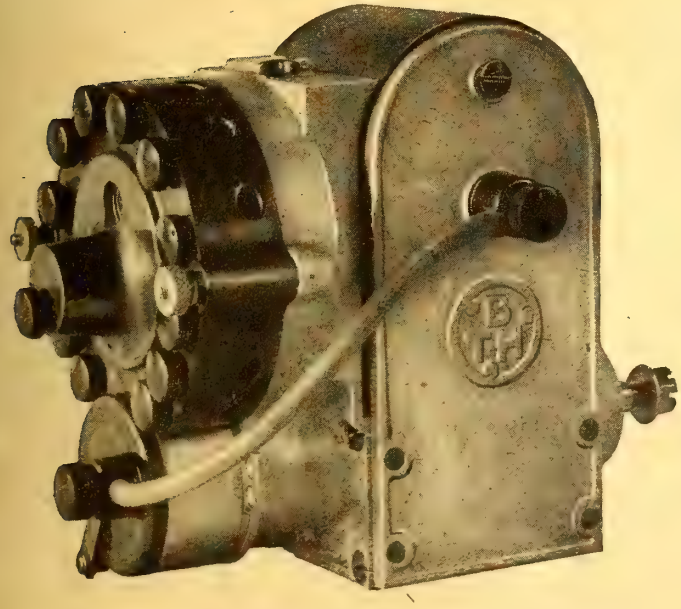
PRESENTATION AEROPLANES.

The Manchester Chamber of Commerce has given an aeroplane to the Empire of India. The machine, which is named "Manchester," was presented on March 2nd at a gathering in the city which included Lord Desborough, president of the Imperial Fleet Committee. He said that the Committee owed its inception to the fact that a number of public men saw the vital importance of flying some time before it seized the imagination of the people and the Government. They wanted to present to the great self-governing Dominions and India the nucleus of an air fleet, so that they might be prepared for contingencies. [It occurs to one that the nucleus will be very small by the time the "Manchester" reaches India after service at the front for three years or the "duration of the war."—Ed.]

A telegram was read from the Viceroy of India stating that in India scope for air activity and usefulness had greatly developed. Our aviators' operations had shown how aircraft could be used in frontier warfare.

Where absolute reliability is essential

B.T.H. Magnetos
are specified.



OUR extensive and varied experience in the manufacture of high quality electrical apparatus has been drawn upon in the design and manufacture of

B.T.H. Magnetos

with the result that they are to-day the equal of any magneto in the world, and their absolute reliability has been proved in service under the most difficult conditions.

Although our present output is requisitioned for war purposes, supplies will be available after the war for those desiring the highest quality magnetos of British manufacture, which will give economical and thoroughly satisfactory service.

Member of the British Ignition Apparatus Association.

FLYING IN DENMARK.

The Aeroplane's Danish Correspondent writes:—

Earnest work with flying-boats in Denmark has been known for several years, but being carried out by the Royal Dock Yards, and the good results standing to the credit of its sub-director, Mr. H. C. Christensen, particulars have not been available.

Some illustrated records have now been published from which it is permissible to state that the two original Donnet-Levique flying boats proved rather unsatisfactory, the planes changing in shape and angle of incidence, owing to unsuccessful design and inferior materials. Wherefore one of them was rebuilt and accompanied the submarines over a respectable distance in the spring of 1914.

A side elevation of the Danish Naval Flying Boat.

During the summer a new flying boat was built, where only the boat shape and the motor installation were maintained. The area of surface was increased from 21 square metres to 30 square metres, the wing curve improved and the whole construction lightened by the employment of hollow spars and supporting ribs, as well as the resistance being reduced to furthest extent. This resulted in an increase of the useful load, comprising pilot, passengers and fuel for 1½ hours, to the same number of passengers and 3½ hours' fuel. The gliding capacity was improved, too, and the speed was equal to that of the smaller type.

This flying boat "Maagen (Seagull) II." undertook daily patrol flights in all weather conditions during autumn, 1914, and put up both Danish distance and altitude records. In spite of holidays and periodical engine overhauls the first two flying boats built at the Royal Dock Yards were in service on 160 days during the latter nine months of 1914.

From the experience gained the Dock Yards developed a new type, striving foremost at a quicker rise from the water, a higher stability and an increase of speed to be obtained from a special hull-shape and from an improved plane design and general mounting. The first tests with "Maagen III.," illustrated herewith, in December, 1914, resulted in following performances, with the same horse-power—80 Gnome—compared with the before mentioned flying-boat.

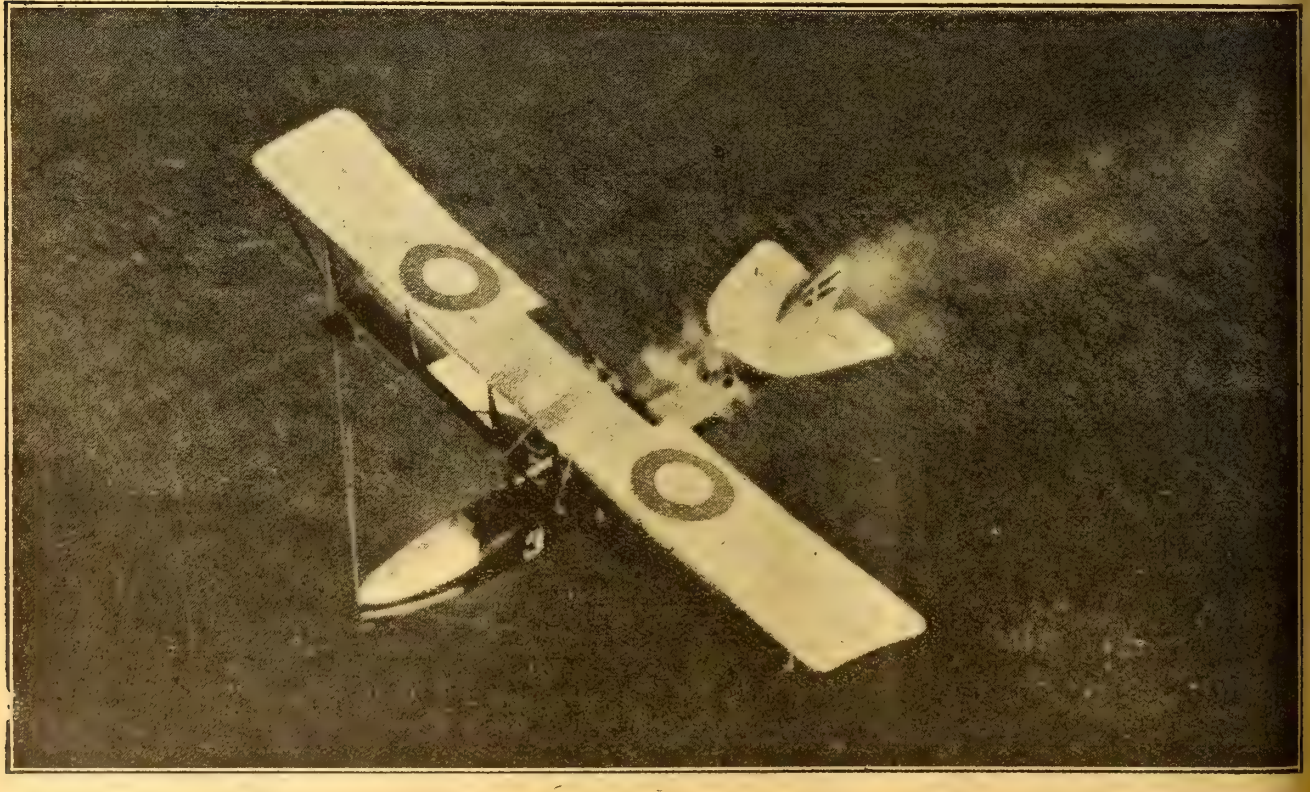
The speed was increased by 12 kilometres per hour, the climbing capacity to 1,000 metres was reduced in time from 16 minutes to 8¾ minutes, the rise taking place after a start of 15 metres' length against 40-50 metres formerly. These results were largely owed to the figures suggested by the scientific research of Eiffel and the British National Physical Laboratory.

Later developments in models and horse-power have been along the lines followed too in the belligerent countries, but here it is not yet permittable to publish particulars.

AIRSHIPS AT A DISCOUNT.

From the "Times" of March 13th:—

The last annual report of the German Airship Company, of Frankfurt-on-Main, seems to show that the company has almost entirely abandoned the construction of airships.



According to the "Frankfurter Zeitung" the year's profits on construction have fallen from £6,795 to £2,794, "because the company had to abandon for the most part its former branch of construction." The airship sheds belonging to the company are valued at only £7,800, as compared with £16,350 a year ago. It is stated that "since the autumn of 1917 the company has devoted itself to a new field of work, which promises reasonable profits."

THE AERONAUTICAL SOCIETY OF GREAT BRITAIN.

Mr. W. H. Barling, B.Sc., A.F.Ae.S., will read a paper on "Timber, its Identification and Mechanical Properties" before the Aeronautical Society on Thursday, April 11th, at the Royal Society of Arts, Adelphi, at 8 p.m.

THE LINEN INDUSTRY.

The already numerous war anxieties of Ulster linen manufacturers have been added to by the extraordinary delay of the War Trade Department in London in issuing export licences, and one of the largest firms announces that owing to the delay and consequent congestion in the warehouses they will be closed until sufficient licences are obtained to justify a resumption of work.

A Danish Naval Flying Boat, photographed from another aeroplane.

Britain Supreme in the Air!

ROLLS-ROYCE AERO ENGINES

like Rolls-Royce Cars are the best in the World. By their wonderful achievements they are making Britain and her Allies Supreme in the Air.

Describing the historic flight from London to Constantinople in thirty hours the "Autocar" says:

"The fact must be recorded that the Engine never failed for a moment throughout the entire journey to Constantinople. Great therefore as was the reputation of the Rolls-Royce Engine before the flight, the epic achievement described added new laurels to its wonderful career."

Trade Commissioners.

Can their Services be Turned to Account by the Aircraft Industry?

Some few years ago the British Government made the surprising discovery that the interests of our industries in the Empire Overseas were worth safeguarding.

Until that time the foreign manufacturer desirous of cultivating our markets in his own interest could always depend upon the active help of the representatives of his Government on the spot. Not so the Britisher, who was obliged to shift for himself and to do his business with anyone left available after the astute foreigner had nobbled nearly all the most capable local men.

To remedy this state of affairs, the Government, in a fit of unwonted generosity, provided sufficient money to pay the salaries—strictly moderate—of no less than four Trade Commissioners who were supposed, between them, to cover and to be thoroughly familiar with the business community and methods of an Empire which, despite the efforts of our politicians, is still somewhat larger in extent than Upper Tooting.

The experiment was successful. The Trade Commissioners found more than enough work to do and realised that, were their numbers multiplied, there might be a chance of getting some of it done.

Consequently, after a few years of appreciative observation of its handiwork, and stimulated by the war to fresh exertions, the Government decided to increase the service of Trade Commissioners very materially—I believe the total is presently to rise to as many as twenty, and on that assumption I leave my readers to estimate how many square miles must come within the jurisdiction of each man.

The result of this calculation will, I think, serve to corroborate my impression that the Trade Commissioner who goes for broad principles and indulges in a wide outlook has a better chance of cutting some ice than the man who specialises in details.

This, I gather, is the collective view of the Board—largely consisting of real business men—responsible for selecting candidates. Thus it seems probable that the enlarged service will consist mainly of men possessing breadth of view and of education, and therefore competent to exert influence in the less hide-bound Government circles of the Oversea Dominions.

From the point of view of the Aircraft Industry, this is all to the good. The Industry does not seek to peddle its wares. It does not need inquiries to be made, on its behalf, into the status and honesty of small oversea traders. Aircraft cannot be sold like soap or gramophones.

Now I suggest that the first thing we have to do is to become quite clear as to what we do want.

Is there any information, that a Trade Commissioner might gather, which would be of real use to us?

If there is, then we ought to tell him so, and to tell him what we want him to find out for us, and why. Give him a chance of showing intelligence, and give him special opportunities of directing that intelligence on to the development of the Aircraft Industry.

I take it that one of our biggest potential markets in peace-time lies in the inauguration and maintenance of passenger and mail services in and between countries where other forms of transport and communication are not all they might be. If this be so, we want to teach the Trade Commissioner, and through him the Governments of those countries, to view the problem of express passenger and mail services in terms of aircraft.

This is a point of view that is still novel, despite the lessons of the war.

Take Australia, for example. Australians have reconciled themselves to the idea that the journey from Melbourne to Perth cannot occupy less than a certain number of days. Nobody troubles himself over developments which are dependent on reducing the journey by 90 per cent. But it is time to review the whole position.

How could Australia benefit, directly or indirectly, by bringing her chief centres much closer together?

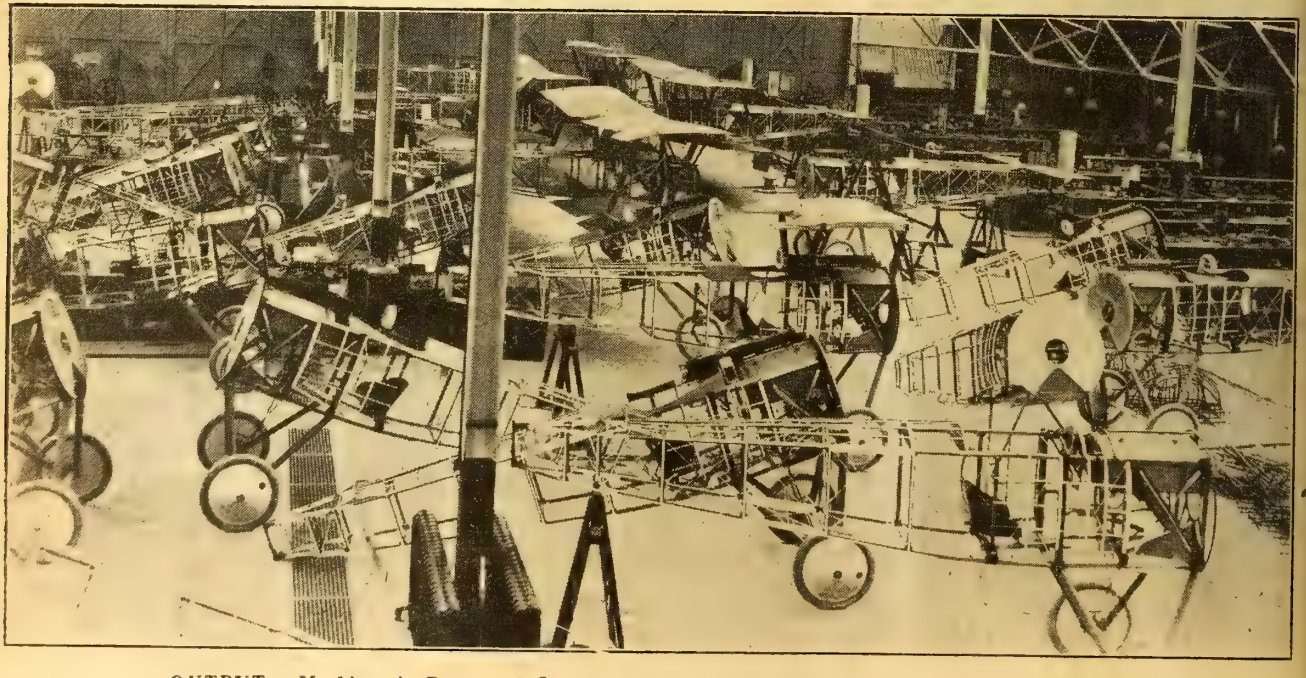
I do not know. I doubt if anyone knows. But I suggest that nobody has bothered about what has been assumed to be an impossibility.

Now it is nothing of the kind. It is the point of view that needs adjusting, if aircraft are to come promptly into their own.

The Trade Commissioner can effect the adjustment if we give him the material for the work, and imbue him with the Industry's own knowledge of what it can undertake and successfully perform, and at approximately what price the thing can be done.

Would it not be worth while to prepare a little informative statement for this particular purpose, and to arrange to keep well in touch with the Trade Commissioners, reminding them periodically of our requirements, and thus keeping our industry well up the list of those which they will try specially hard to help?

No man can be equally interested in everything. The Trade Commissioner, like anyone else, will find that he can do the best work for those industries whose needs he understands—that is to say, for those who take the trouble to explain their needs to him.



On the other hand, those which neglect him are pretty certain to be neglected by him.

Surely, then, it is up to us to ask him to inculcate our point of view into all and sundry during his travels, and to let him know what sort of information we want on such subjects as the inadequacy and slowness of railway services, the lack of roads, the loss of business due to poor postal facilities, the need for prospecting undeveloped areas, and so on.

With such information in our possession we could prepare schemes for aerial services that are actually needed, and get straight into touch with the right officials—indicated by the Trade Commissioner in each case—before whom to put them.

Out of this real business should result.

The "Guardian Angel" Parachutes

THE GUARDIAN ANGEL PARACHUTES
TRADE MARK
(REGISTERED)

THE CLASS OF OUR LIFE-SAVING EQUIPMENT.

The basic characteristics of our Parachutes, which differentiate them from all others, and for which we hold master-patents, are automatic (i.e., compellative) opening, and static and kinetic control (i.e., control at rest and in action) of all their component details. The ordinary parachute is under no sort of control, and what we have accomplished is to convert this most insubordinate Apache of the Air into a staid servitor, incapable of acting in any other than the designed way. We have made the Parachute into an automatic machine, so that failure to open and entanglement of rigging has become a physical impossiblity. Every Type of Parachute made by us possesses these paramount and indispensable principles of machine action. The aviator makes his jump, and the Parachute automatically does the rest.

THE RANGE OF OUR LIFE-SAVING EQUIPMENT.

Life-saving Parachutes for school machines on the Training Grounds.

Life-saving Parachutes for heavy bombing machines, fighters, and scouts.

Life-saving Parachutes with minimum weight and without additional air resistance for the fastest machine that flies, and capable of release from any vertical or horizontal angle, or when flying upside down.

Solo-Parachutes for use from Airships and Observation Balloons, with a high but constant-speed initial-drop from a fired gas-bag, automatically opening into the low-speed descent required for a safe landing.

Basket-Parachutes for instantly detaching the basket containing two observers, their instruments and records, from a fired gas-bag, with high-speed initial fall, changing automatically to slow-speed descent for the safe landing. Parachute instantly released on landing, to avoid dragging the basket.

Variable-speed Parachutes, to permit a sudden high-speed drop, controlled by the Parachutist, to escape from an enemy aeroplane, and to stop on any portion of the grade of descent to avoid an objectionable landing. This variable-speed apparatus is applicable to the whole range of our Parachutes.

Non-spinning shock-absorber slings, taking all shocks off Parachute and man.

Aviator's Harness, distributing the stresses over those parts of the body best able to sustain them, and instantly releasable when alighting on land, on a roof, in a tree, or in water.

OUR EQUIPMENT IS THE RESULT OF ENGINEERING SCIENCE APPLIED TO DIFFICULT AIR PROBLEMS. WE BELIEVE THAT ITS EXTENDED USE WILL DOUBLE THE FLYING LIFE OF OUR FIGHTERS AT THE FRONT.

RELIABILITY—First. RELIABILITY—Second. RELIABILITY—ALL THE TIME.

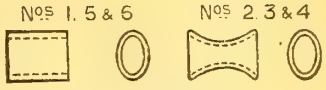
Allen's Steels

For Motor Cars
For Aeroplanes

Write for this Book.

IN Aircraft and Aeroplane-part manufacture the precise **character** of the Steel used makes all the difference. Endless trouble and loss are avoided by using for each part the one Steel which has **all** the qualities required for that part, and has been worked-out with knowledge of the practical engineering requirements.



Allen's Catalogue D (3rd Edition) contains valuable information on Steels for Aircraft and Motors.

WRITE FOR IT NOW.

Manufacturers of Steel of every description, including

HIGH GRADE NICKEL STEEL & FORGINGS

for Naval and General Marine Purposes.

Special Heat Treated Alloy and other Steels for Aircraft and Automobile Purposes

IMPORTANT SPECIALITIES:

S.S.G. **A SPECIAL NICKEL CHROME GEAR STEEL.**
FOR AIR OR OIL HARDENING. When treated this steel has exceedingly tough properties and is specially suitable for Gear Wheels, Connecting Rods, etc.

S.G.W. **A NICKEL CHROME STEEL IN FOUR GRADES.**
Eminently suitable and strongly recommended for Gears, Crankshafts, and other highly stressed parts, and having exceptional machining qualities. Combines unusually heavy shock-resisting and wearing properties with silent running.

G.P.S. **A HIGH GRADE ALLOY CASE HARDENING STEEL**
for severely strained parts, such as Gear Wheels, Gudgeon Pins, etc.

Continental Steel Works and Novo Steel Works, Sheffield.

Barimar Repairs are Permanent

IF there is one outstanding merit in Barimar Scientific Welding Service it is the permanency of Barimar repairs.

Barimar aims first at efficiency of service, for that is what counts in the long run. Price is measured only by service, so it pays to give just enough to buy security and worth.

Barimar repairs all metals under a guarantee of satisfactory service.

Cylinders, Crank and Gear Cases, Crank Shafts, Radiators, Lamps, Chassis Frames, Machinery Parts, Fly-wheels, Engine Cases, Boilers, Ship and Railway Work, Frost-cracked Cylinders and Radiators get special attention. We never fail on Aluminium work.

Do you want a copy of our
NEW MANUAL ?

"The Welding Test" is published at 6d., but we have a few copies left and shall be pleased to present one to any reader of "The Aeroplane" who has a fractured metal part to repair. Ask for Manual "B.C." and mention "The Aeroplane," please.

Send Your Repairs to Barimar

Strip all fittings, label with your name and address, send by passenger train if weight permits. Goods rail consignments must be carriage paid. Advise us by post when goods are sent.

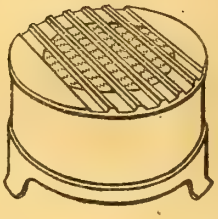
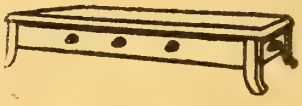
Six-Cylinder Crank Case after repair by Barimar with welded parts machined, lined, and cleaned up. No distortion took place and the welded portions could not be seen. A permanent repair.

BELLING
ELECTRICAL ACCESSORIES



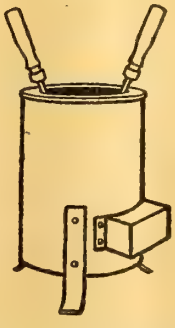
AIRCRAFT Manufacturing Purposes.



ELECTRIC FIRE.
Office Pattern. List No. 617.
An ideal fire for small offices, waiting-rooms, passages, etc. We have also supplied a large number to Aerodromes for general heating. Numerous other designs are available.
Price **35/-**
Dimensions—Height 17⅜ in., Width 17¾ in., Depth 5¾ in.

ELECTRIC AIR WARMER.
List No. 960.
A reliable low temperature heating appliance, suitable for work rooms, etc. Can be used in any position without risk of fire.
Price **25/-**
Dimensions—Length 15½ in., Width 6½ in., height 4⅜ in.

ELECTRIC BOILING RING. List No. 7.
This will do all the same operations as an ordinary gas ring. Used for heating glue pots, and when loaded at 250 watts can be attached to any electric lampholder.
Price **15/-**
Diameter 7 in.



ELECTRIC HOT PLATE. List No. 18
Useful for keeping food warm, and also for drying purposes of all kinds.
Price **100/-**
Size 36 in. by 18 in.

ELECTRIC IMMERSION HEATER.
A reliable appliance for heating water, oil and other liquids. Can be easily fitted to existing tanks, etc.

ELECTRIC ENGINE WARMER.
For placing under engine in cold weather to prevent freezing. They are quite gas and fireproof.
Price **40/-**
Size 12 in. by 7 in.

ELECTRIC SOLDER POT. Type A.
This is the latest system for heating ordinary soldering irons, and consists of a pot of molten solder into which the irons are placed for a short time till heated.
Price **65/-**
Dimensions—Outside diam. 8 in., inner pan 5⅛ in. diam. at top, Depth 7 in.

All the above prices are subject to an advance of 25 per cent.

Our Catalogue illustrates many other special appliances we make for Manufacturing Purposes, Munition and Factory Work, Hospitals, Mess Rooms, etc.

ALUMINIUM CASTINGS

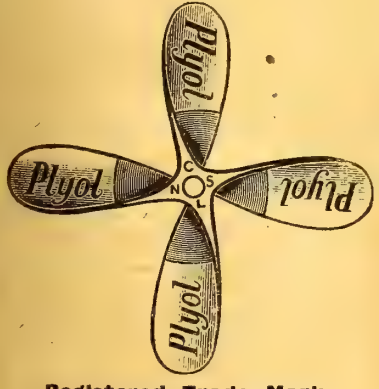
OF EVERY DESCRIPTION.

We make a Speciality of Aeronautical and Automobile Work.

We are making many thousands of **Aluminium Die Castings** weekly under the celebrated **Cothias** process—in many cases **entirely eliminating** machining operations, and we hold the sole manufacturing rights in the British Empire for this process.

Chemical and Physical tests are made on our own premises, and our **Castings,** both **Sand** and **Die,** are produced under the most up-to-date and scientific methods.

Sole makers of the **Birmal Aluminium Pistons,** thousands of which are running to-day in a highly satisfactory manner under the most severe conditions.



Highest Class Castings to Government Specifications. Prompt Delivery.

CONTRACT WORK

The Three "P.'s"

Precision, Promptitude, and Price—these are the Three Dominant Factors in the choice of an organisation to do your contract work for you.

We suggest ourselves. There are reasons for the suggestion.

First, with regard to Precision—our organisation and system of production ensures that you get what you want always.

Secondly, you are assured of Promptitude because our organisation is big enough and efficient enough to deal with your requirements without delay. You get what you want, when you want it.

Thirdly, as to Price—let us quote you, and you will find we can show you advantages.

THE AIRCRAFT TRADER

MARKET TOPICS.

(Prices are for quantities on usual terms.)

COPPER.—The American position.—The output of Copper is apparently well maintained, although it is not quite sufficient to meet all demands, and there is a feeling in certain quarters that an increase in the official price would have a beneficial effect on output.

The fuel and transport difficulties have eased considerably, and very little trouble is now being experienced.

Home Position.—There is very little change here. Supplies are well maintained and are entirely under official control.

TIN.—Stocks are very low and supplies are scarce; there is, however, a distinct sign of improvement. The Metal Exchange Committee, which is controlling this market, have the situation well in hand, and the control scheme instituted by them is working satisfactorily.

Prices have declined to a fairly reasonable figure and buyers are eager to procure the small quantities which are being offered.

There is an agitation for an all round increase in prices. This appears to be inevitable and it is more than likely that the Ministry will give their decision during the next fourteen days.

LEAD.—The position is unchanged. Supplies are not difficult to procure, and there appears to be plenty of old Lead available, due apparently to the authorities having paid special attention to the collection of Scrap Lead.

STEEL.—Although the demand for Steel continues to increase, supplies are fairly easy to procure. This, of course, does not apply to High Speed or Cast Steels. High Speed Steel is very difficult to procure, and there does not appear to be any indication that the situation is likely to become easier. Prices remain unaltered.

TIMBER.—The position of the Timber market is far from satisfactory. There is hardly any Silver Spruce coming into the country, and, apparently, one of the substitutes is not giving the satisfaction expected and large quantities of this wood have been imported on Government account.

The whole situation is in the hands of the authorities, and it is hoped that the results of the next four months will justify their apparent optimism. The American authorities appear to have investigated the Timber question very exhaustively, and one is indebted to the "American Lumbermen" for the chart which is reprinted giving detailed comparisons of the properties of various woods tested with the object of ascertaining the possibility of their use on aeroplanes.

It will be observed that the woods which compare very favourably with Silver Spruce, which is generally accepted as the ideal wood for aeroplane construction, are: Douglas Fir, Sugar Pine, Yellow Poplar and Cottonwood.

Other woods which compare fairly well with Silver Spruce are: Cypress, White Pine and Basswood. There is a huge demand for Douglas Fir in U.S.A. for aeroplane work, and it is reported that the United States Government are also asking all firms holding stocks of Sugar Pine to report them at once.

One or two good shipments of Mahogany and Walnut have been received during the past ten days. The Timber Controller has issued a new order and schedule of prices for Home Grown Timber. There is not, however, any alteration in the prices of English Ash.

FABRIC. — Supplies at present are fairly good. There is, however, some doubt about the certainty of future supplies, and it is understood that the Government are making provision for supplies of Cotton to be available in the event of Linen not being procurable. The whole situation hinges round the flax crop, and this in turn depends upon the weather. Special exertions are being made for a bumper crop.

The anxious period will, however, be between now and October, when the new crop of flax should be available. It is to be hoped that the Powers That Be have had sufficient forethought to conserve the stocks of Linen by using Cotton wherever practicable and laying by stocks to meet the huge demands which will be made for Fabric this summer.

CABLE.—The Ministry of Munitions has now fixed the prices of Flexible Steel Wire Rope, and a schedule of same is shown above on this page.

OFFICIAL PRICES OF STEEL CABLES.

Flexible Steel Wire Rope. (Spec. 2W., 2/11/17.)	Spec. item Nos.	Minimum Breaking Strength.	Maximum Diameter.	Construction.	Weight of 100 ft.	Issue Prices. Mat. issued up to and including 4/3/18.	Mat. issued on and after 5/3/18 & until further notice.

LEGISLATION PENDING CONCERNING PATENTS AND TRADE MARKS.

The President of the Board of Trade received recently a large and important deputation, organised by the London Chamber of Commerce, representative of the principal Chambers of Commerce of the country, the Federation of British Industries, the London and Eastern Associations of Controlled Firms, the Institution of Electrical Engineers, the Chemical Industries, the Newspaper Proprietors' Associations, and others, for the purpose of making representations concerning the new Bills to amend the Patents and Designs Act, 1907, and the Trade Marks Act of 1905, which were introduced in the last session of Parliament.

Sir George Croydon Marks, in introducing the deputation, said they were of opinion that the position of patentees had not been fully appreciated by those who had drafted the Bills. The proposals in reference to the trade-marks had created alarm, not only in this country, but in America, where it was felt that the sweeping reforms proposed would amount to almost confiscation of the established rights and interests that had been built up in this country in accordance with the provisions and the safeguards of the existing legislation, under which it was believed that the heavy expenditure incurred would be protected for the interests of those who had created the industries associated with the trade-marks in question.

The President, in reply, said the measures introduced were in the nature of "war-time" measures, and were designed solely for the protection and betterment of the industries, and without the slightest intention of hampering or restricting trade or commerce. Abuses had crept up in the past that our enemies had been most assiduous to take advantage of. For example, they had endeavoured to build up by the use of trade-marks as the names of different products perpetual monopolies that would prevent any person or any trader in this country from being able to supply those products. Thus, while if a patent were granted there would be but a limited monopoly for fourteen years, when the process would become public property; yet by the astute coining of words to describe a product that which was in effect created was a perpetual monopoly.

In reference to a suggestion that had been made for the introducing of a short non-contentious Bill to extend the life of patents for the period of the war, sometimes that which appeared a non-contentious Bill provoked a great deal of opposition, and he thought there would be no greater difficulty in carrying through legislation to bring about all the desired reforms in connection with our patent procedure than in carrying through a Bill dealing with only a portion, namely, the difficulties which had arisen in regard to the lapsing of patents that could not be worked during the war. All classes of the community suffered and had to make sacrifices, and it would be impossible to place inventors and patentees, however important their inventions might be, in a privileged position. Provision had been made in the Bill for extending the life of all patents, and special provisions for extension were proposed when it could be shown that direct losses had resulted due to the war, while a corresponding benefit had been given to the nation in connection with the industries at the expense of the patentee. He did not wish to indicate the character of the amendments that might be entertained, but he wished the deputation to clearly understand that the one object in view of his department was to assist the industries and to develop the resources of the country.

Sir George Croydon Marks, in thanking the President, assured him that the deputation highly appreciated the sympathetic manner in which he had listened to their views and the hint that had been given concerning the possibility of amendments that could be introduced to the existing Bills.

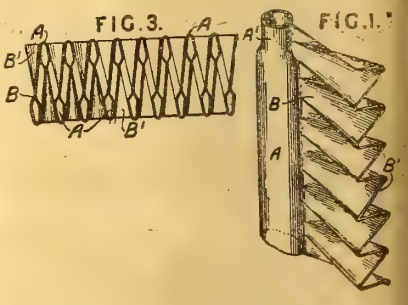
PATENTS INDEX.

The subjoined list of recent inventions has been specially compiled by The Aeroplane from the current Official Patents Records :—

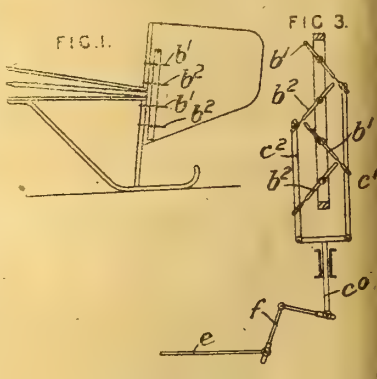
Patent Applications.

Allen, R. Gun mountings for aircraft. No. 5498. March 28th.
Armstrong, Whitworth & Co., Sir W. G. Covers for holes in fabrics of airships. No. 5393. March 27th.
Athawes, F. A. Aeroplane trapper. No. 5177. March 23rd.
Bairstow, W. Struts for aeroplanes, etc. No. 5547. March 30th.
Barnholdt, C. F. Control of aeroplane engines, etc. No. 4991. March 21st.
Brereton, H. T. Aeroplane clinometer. No. 5022. March 21st.
Bridger, D. H. Engines for aeroplanes, etc. No. 5101. March 21st.
Brook, C. F. Clinometer for aircraft, etc. No. 4799. March 19th.
Calthrop, E. R. Parachutes. No. 5247. March 25th.
Calthrop, E. R. Parachutes. No. 5248. March 25th.
Chamier, F. W. Airships. No. 5499. March 28th.
Clark, L. F. Automatic level for aerial machines. No. 5214. March 25th.
Cook, C. W. Aeroplanes, etc. No. 5077. March 22nd.
Dawson & Co., J. Building up wood structures, such as ailerons, etc. No. 5295. March 26th.
Dawson & Co., J. Building up planes of aeroplanes, etc. No. 5566. March 30th.
Done, J. S. Appliance for lifting and moving aeroplane cases, etc. No. 5068. March 22nd.
France, A. G. Turnbuckle or wirestraining device for aeroplane wires, etc. No. 4901. March 20th.
Gow, J. J. Waterproofing-solution for aeroplane wings, etc. No. 4957. March 20th.
Gow, J. J. Waterproofing-solution for aeroplane wings, etc. No. 4958. March 20th.
Healey, A. E. Device for detecting and locating sounds of aircraft, etc. No. 5295. March 26th.
Hyatt, N. L. Aeroplane propelling-devices. No. 4849. March 19th.
Jensen, C. A. A. Means for directing airmen. No. 4871. March 19th.
Kennedy, C. J. H. Mackenzie-. Holding and releasing means for use in aircraft. No. 5165. March 23rd.
Kennedy, C. J. H. Power plant for aircraft, etc. No. 5321. March 26th.
Kitchen, J. G. A. Aircraft. No. 5370. March 27th.
Lee, W. Device for indicating inclination of aircraft, etc. No. 4980. March 21st.
Lenton, H. H. Clinometers for aircraft. No. 5389. March 27th.
Lenton, H. H. Instrument for determining relative positions of aeroplanes. No. 5390. March 27th.
Lewis, F. J. Aeroplane and motor-car combination. No 4881. March 20th.
Lloyd, H. M. Aeroplane propelling-device. No 4849. March 19th.
Lock, W. H. Planes and ailerons for aeroplanes, etc. No. 5134. March 23rd.
Macfie, R. F. Apparatus for indicating land speed and angle of drift on aircraft, acting also as a bomb sight. No. 4823. March 19th.
Miller, R. Sight for aerial guns. No. 5172. March 23rd.
Mooney, D. J. Aircraft. No. 5012. March 21st.
Nieuport & General Aircraft Co. Applying dope, etc., to surfaces of part of aircraft. No. 5471. March 28th.
Page, F. H. Aircraft. No. 4732. March 18th.
Parnall, G. G. Internal-combustion turbine engine for aircraft, etc. No. 4974. March 21st.
Pearce, P. M. Wood splice for aircraft. No. 4912. March 20th.
Roberts, C. R. Aero-engine. No. 5269. March 26th.
Roe, A. V. Strainers or turnbuckles for tie-rods, etc. No. 4927. March 20th.
Sabel, W. J. Means for indicating inclination of flying-machines, etc. No. 5438. March 28th.
Schurr, A. E. Petrol, etc., tanks for aeroplanes, etc. No. 5263. March 28th.
Shute, W. O. Device for detecting and locating sound of unseen aircraft, etc. No. 5295. March 26th.
Smith, R. Clinometer for aircraft, etc. No. 4906. March 20th.
Smith, R. A. Means for stabilizing balloons towed by vessels at sea. No. 4967. March 21st.
Sopwith Aviation Co. Clinometers. No. 5481. March 28th.
Taylor, W. T. P. Instrument for locating aircraft by day or by night. No. 5124. March 23rd.
Thomas, G. H. Means for continuously indicating relative position of aircraft to vertical. No. 5297. March 26th.
Thomas, G. H. Internal-combustion engines for aircraft. No. 5305. March 26th.
Williams, G. Level indicator for flying-machines, etc. No. 4898. March 20th.
Williamson, J. W. Heel indicators for aeroplanes. No. 5374. March 27th.
Wirtz, L. Manufacture of propellers for aircraft. No. 4737. March 18th.



Complete Specifications Accepted, prints of which can be obtained on and after April 11th, 1918.

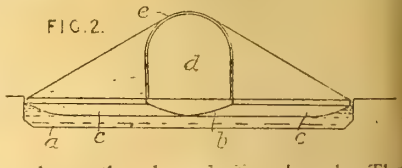
113,979. Oct. 16th, 1916. Emmons, R. A. Aeroplanes.
103,646. Dec. 28th, 1916. Beld, C. M. B. van den. Sighting-devices for anti-aircraft guns.
114,057. April 14th, 1917. Lowes, T. T. Aeroplanes.



Abridgments of recently published Specifications.

112,666. Radiators for Internal-combustion Engines. Lamplough, H., The Old Tan House, Bray-on-Thames, Berkshire.

A gilled tube A for use in the radiators of internal-combustion engines is formed from a metal strip bent along its longitudinal axis and with its edges united to form a longitudinal gill B. The tube A is of wedge shape, as shown in section in Fig 3, and is formed by pressing the strip around a mandrel. The gill B is corrugated by means of dies and is soldered along its edge, the corrugations being deep at the outer edge B^1 of the gill and gradually becoming shallower towards the tube. The tubes have circular necks A^1 for securing to end-plates, and are assembled in a double row with the gills of each row projecting towards the other row, the gills thus forming a spacing means between the tubes. The gills of one row may be soldered to the tubes of the other row by dipping or otherwise.

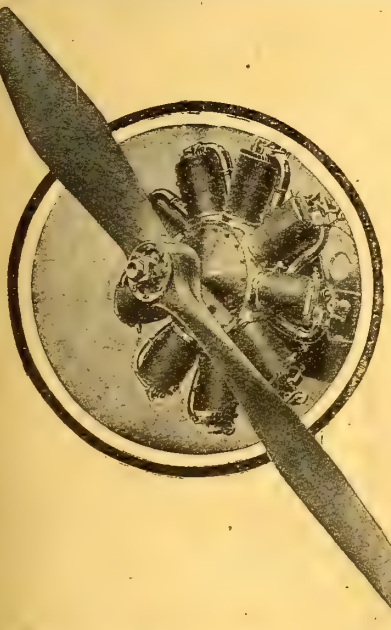


112,775. Aeronautics. Maiche, C., 19, Rue Auguste-Beau, Courbevoie, Seine, France. Jan. 2nd, 1918, No. 122. Convention date, Jan. 26th, 1916. Not yet accepted. Abridged as open to inspection under Sect. 91 of the Act.

Planes, Arrangement of; Stopping Way; Parachutes.—A braking device for aerial machines comprises a series of planes arranged behind the centre of gravity and adapted for use also to counteract the sinking of the nose of the machine or, as in the case of a nose-dive, to have a parachute action. Fig. 1 shows a series of planes b^1, b^2 arranged behind the tail plane and serving as auxiliary supporting-planes, but capable of being adjusted to the position shown in Fig. 3 to act as a brake. The planes are adjusted in pairs in opposite directions by means of bars c^1, c^2 actuated by connexions c^3, f, e.

112,806. Aircraft Sheds. Little, J. R., Morden, Duddingston Road, Portobello, Scotland.

A movable floating shed for aircraft consists of two pontoons b, c at right-angles, the main-pontoon b forming the base or floor of the shed and carrying a superstructure e which has a sliding, hinged, or other door d at each end. The pontoons float in a reinforced-concrete tank a, and wheels or rollers may be fitted to their ends. The whole shed and pontoons may be turned by capstans and cables, and a wind vane or sail may be provided on one side of the shed.



A CHANGE OF ADDRESS.

On account of the increased demand for workshop and practical training for service requirements, the Motor Training Institute, Ltd., have transferred the whole of their instruction to increased accommodation at their works and garage, 21A, Loudoun Road, St. John's Wood (five minutes from Marlborough Road Station), which will in future be the registered address of the company, and to which address all communications should be sent.

CURRENT TOPICS.

ROLLS-ROYCE, LTD.

The meeting of Rolls-Royce, Ltd., was held at Derby on March 22nd. Mr. Ernest Claremont (the chairman of the company) presided, and in moving the adoption of the report and accounts, he said: The date of this meeting is later than that of last year, when we had to hold our meeting without having the accounts before us. It will be necessary later, when the accounts are ready, to hold another meeting. We are fortunate, however, in being able to foresee that the profits will not be less than last year, and to so conclude that the same dividend can be safely declared. Beyond that I am quite unable to say what the profits will be. So far during the war our profits have been small, compared with peace time, and we have had no excess profits to pay. The delay in completing the balance-sheet is due to our inability to fix the values of buildings and plant, provided solely for the purpose of the war.

The Share Bonus.

Apart from the cash dividend, the directors are recommending the distribution of bonus shares, "share for share." That is to say, for every share you now hold you will receive another. Such distribution is, of course, subject to the approval of the Treasury. You will understand that the distributing of these shares has merely the effect of declaring that the various reserves which have been created in past years will now irrevocably be retained in the business.

No Amalgamation Contemplated.

The increase of the nominal capital of the company, to allow of the creation of the bonus shares, amounts to £200,000, and as our capital to-day is £200,000, the figure in future would be exactly doubled—i.e., £400,000. As mentioned in the directors' report, the company's energies continue to be fully engaged on the production of munitions of war, and I have no doubt will continue to be so whilst the war lasts. I take much pleasure once more in expressing, on behalf of the Board, their appreciation of the whole-hearted efforts of the company's staff, from Mr. Royce, our engineer-in-chief, and Mr. Claude Johnson, our general managing director, downwards. I have been told by a shareholder that there is a rumour of the company amalgamating with another company, and to prevent any misunderstanding I should like to state that nothing of the kind is in contemplation.

The motion was carried unanimously. A dividend of 10 per cent. in cash was declared, and the proposed distribution of bonus shares was unanimously approved. The retiring directors and the auditors having been re-elected, a vote of thanks to the chairman closed the proceedings.

THE COWPER COLES AIRCRAFT CO., LTD.

Reference has already been made in these columns to the litigation pending in the law courts connected with the disputes which have arisen between the directors of this company, and I have now been favoured with a copy of the transcript notes taken at the hearing in the Chancery Division before Mr. Justice Sargant on March 15th last dealing with the Motions precedent to the trial.

Whilst the voluminous shorthand notes make remarkably interesting reading, the matter, particularly at this stage, has not sufficient general public interest to warrant being gone into here in any detail. The company is a private one, and the public investor fortunately is not involved. Consequently, for the present, at any rate, one may dismiss the subject, at the same time reflecting that it is a pity that in such a period of trouble the entire energies of the Board are not consecrated to producing aircraft to fight the country's enemies instead of fighting among themselves.

THE BRITISH ALUMINIUM CO., LTD.

The Chairman, presiding at the eighth Ordinary General Meeting of shareholders, in the course of his speech made some remarks of particular interest to the Aircraft industry in his review of post-war trade. After referring to the past year's trading he added:—

The uses to which the metal is being put at the present time, while largely of a destructive character, will considerably extend the field in commercial enterprise after the war. There is no doubt that the enormous strides which have been made in the development of aircraft, both airships and aeroplanes, have, in a sense, been due to the use of aluminium in either pure or alloyed form, and I think there is every likelihood that the metal will play as important a part in future commercial enterprise as it is doing to-day in the war. There is also a large field in connexion with motor-cars, agricultural and commercial vehicles, the chemical and brewing trades, and the electrical industry, particularly for transmission lines, where the metal will prove a strong competitor with copper. There were indications of this trend even before the war, which, of course, has meantime been arrested. It may be interesting to note, in connection with the rapid development of the use of the metal, that the total world's consumption to-day is approximately five times the consumption of ten years ago. This rapid increase in its uses has necessitated extensive developments in its production during recent years, and such developments have been made, or are in contemplation, all over the world. The British Government have recognised that this is a key industry, and that it is essential for the future welfare of this country and its industries that the production should be substantially increased.

Extension of the Works.

We have, as you know, had under construction certain hydraulic works for the provision of additional water supply to a reservoir from another catchment area. The Board of Trade and the Ministry of Munitions have made their own investigations into the matter, and are satisfied that the scheme which the company has put forward will make the most economical use of the power available, and they have signified their approval and promise of support in the application for the necessary powers.

The shareholders have already authorised the application at meetings which were held in January last, and, if the application is successful, the powers should be granted during the present year. The scheme, which is a large one, will take some considerable time to develop, and will involve fairly large capital expenditure. The provision of the necessary capital is a matter which will require most careful consideration, but is not one which calls for decision in the immediate future. It is not contemplated, neither will it be necessary, that the whole amount involved shall be issued at one time, although it will be prudent to make provision so that the capital is available as and when it may be required in the course of the development.

Capital and Labour.

Last year I drew attention to the position the company had acquired since its reorganisation in 1910, and this position has been still further strengthened in the accounts which are now submitted to you.

For some time after the war we shall have a period of inflated costs of production and rationing of raw materials, due largely to the shortage of shipping, and it may be that there will be a period of uncertainty before industry gets into its proper stride in the pursuit of ordinary commercial enterprise. It will be necessary in the national interest that industry shall flourish and progress in order to meet the load of taxation which has been placed upon the country in consequence of the war, and in order to give constant and profitable employment to the men who will be released from the Navy and Army.

I believe that if industry is freed as far as possible, and as quickly as possible, from Government interference and control of its policy, it will rapidly adjust itself to the altered conditions, and will flourish and make progress because of the lessons which have been learned during the war. There is, in my opinion, the basis for a better understanding between Capital and Labour, but that can best be accomplished by heart-to-heart talks between the parties involved, without the necessity of Government interference.

It is the opinion of all large employers of labour that the men are entitled to better wages than they obtained in pre-war days, in order that they may obtain better food and a higher standard of living. Better housing accommodation and education are national matters which cannot be dealt with by industry as such, but proper schemes providing for development along rational lines will, I feel sure, obtain the hearty support of all industrial companies.

In return for better wages and improved conditions the men must understand that they will have to give a better or increased

output, otherwise these conditions cannot continue, as the product of industry has to be sold in competition with all the other countries of the world.

Its accomplishment means hard work for everybody, as our competitors are all equally well equipped, and in some cases, particularly America, better equipped than we are with such fundamentals as money and machinery.

The future of the aluminium industry is certainly encouraging, although it must have the usual ups and downs of trade. The company will take its place in this development, and its strong resources and sound financial position will materially assist it to this end.

BONUS SHARE ISSUES AND THE TREASURY.

Under the heading of "Capitalising Reserves" the case of companies issuing fully paid shares to its shareholders to represent the accumulation of profits was fully discussed from the points of view of the private interest of the investor, and more particularly pointing out the loss incurred to the national revenue by distributions in such form. The article in question terminated as follows:—"At a time like the present it is indeed difficult to understand why the Treasury gives its sanction to such issues." In these notes details of the project to issue fully paid shares to the shareholders in Rolls-Royce, Ltd., are published.

Since, no doubt owing to the publicity of such comments having been brought to the notice of the responsible officials, it is interesting to note that the Treasury Committee are refusing to sanction such issues on the grounds "that the issue of bonus shares in existing circumstances is not in the public interest."

The question naturally arises as to the probable effect of the Treasury decision upon the market value of the shares of such companies as had announced to the public their intention to allot bonus shares. This, of course, is a side of the question that will not affect nor influence the Government official, but it has its importance nevertheless.

The Government restriction of all such issues is, however, a decided step in the right direction, as it is no secret that there are companies (as well as many firms) who will stop at nothing to evade taxation, more particularly with special regard to excess profits duty.

These bonus share distributions are quite fictitious, for the reason that they bring no new working capital into the company, and consequently cannot be urged as necessary for development or as serving any other legitimate purpose. G.A

COMPANIES ANNOUNCEMENTS.

NEW COMPANIES REGISTERED.

Adastral, Ltd.—Private Company. Registered March 19th, to carry on the business of manufacturers and dealers in metal aircraft components, and of metal parts for ordnance, ship-building, railway, or other engines, etc. Nominal capital, £5,000 in 4,500 £1 shares and 10,000 1s. shares.

Mackinnon and Thomas, Ltd.—Private Company. Registered March 21st. Capital, £3,000 in £1 shares. Manufacturers of and dealers in animal-drawn and motor vehicles, internal combustion, steam, electrical, gas and other engines, aircraft, motor boats, submarines, torpedoes, motor and other cycles, munitions, tools, etc.

The subscribers (each with one share) are:—
P. W. Moll, 28a, Basinghall Street, E.C.2, accountant.
Lucy Newmark, 110, Greencroft Gardens, N.W.6, accountant's clerk.

The first directors are:—A. E. Thomas (managing director) and D. D. H. O. Mackinnon. Qualification: 100 shares (managing director 200). Registered office: Lorne Gardens, Park Street, Regent's Park, N.8.

Omegar Lamp Works, Ltd.—Private Company. Registered March 22nd. Capital, £2,000 in £1 shares. Manufacturers of and dealers in electric lamps, motor and aircraft accessories, etc. The subscribers (each with one share) are:—
J. A. Scoular, 83, Merton Road, S.W.19.
Mary Scoular, 83, Merton Road, S.W.19.
Margery Scoular, 83, Merton Road, S.W.19.

The first directors are:—J. A. Scoular and Mary Scoular. Qualification, £50.

MORTGAGES AND CHARGES.

Aeroplane and Motor Bodies, Ltd.—Registered March 8th, 1918. Charge for securing all monies due or to become due to the London Provincial and South Western Bank, Ltd., charged on certain contracts.

Grahame-White Aviation Co., Ltd. (formerly Grahame-White, Bleriot and Maxim, Ltd.).—Registered March 16th, 1918. Agreement and Deed of Charge for securing advances not exceeding £320,000 to the Minister of Munitions charged on lands, leasehold properties, factories, sheds, workshops, offices, hangars, warehouses, stores, dwelling houses and other buildings, etc., plant, machinery, fixtures, fittings, etc., and general charge.

Davidson Aviation Co., Ltd.—Registered Feb. 28th, 1918. £15,000 debentures secured by general charge.

Portholme Aircraft Co., Ltd.—Registered March 12th, 1918. Charged on leasehold property in Huntingdon, £18,000.

Whitehead Aircraft (1917), Ltd.—Registered March 15th, 1918. £300,000 debentures, secured by a general charge.

SATISFACTIONS.

Peter Hooker, Ltd., Walthamstow.—Satisfaction filed March 12th, 1918. £775. Registered Nov. 15th, 1915, and £625 registered March 24th, 1916.

COUNTY COURT JUDGMENT.

Registered February 18th, 1918, against The Aeronautical Institute of Great Britain, 3, Arlington Street, Piccadilly, described as Society for Promotion of Aeronautics, for £19 3s. 6d.

ANSWERS TO CORRESPONDENTS.

Inquiries on any subject affecting or relating to Investments, Stocks, Shares and Securities of Aircraft and kindred companies will be answered in these columns (free of charge).

"Miss E. A. P., Suffolk."—You say you have read the articles published on the subject; there is nothing more to add at the moment.

"S. G., Dennistoun."—The income from "royalties" paid to company forming part of the regular trade or business of the company must be included in its profit, and is taxable after allowing for percentage abatements. If, however, the "royalty" is receivable by a private individual not forming part of his regular trade, business, or profession it would not be taxable.

"Prob. Flight Officer, H.S.M.," "Fuselage," "One Wing," "Clericus," "Mdme. la Veuve":—Want of space prevents replies in detail, but all the points raised are dealt with in the articles concerning this issue. G. A.

QUEEN ALEXANDRA'S VISIT.

Queen Alexandra and Princess Victoria spent the afternoon of April 4th in a visit of inspection to the aeroplane works of Messrs. F. W. Berwick and Co., Limited, in the West London area.

They were received on arrival by Mr. F. W. Berwick, managing director, Mr. Alexander Keiller, Mr. James Greig, and Mr. Lionel Goodricke, directors.

In the machine shops processes were seen connected with the drilling out of cylinders for aeroplane engines, and the cutting and grinding of various component parts. Queen Alexandra and the Princess frequently paused in their inspection and talked to the workers. The Royal ladies talked freely with the girl workers, and Queen Alexandra told some of them, as she had told the workers at other factories, how fine she considered the spirit which had prompted them to work through the holidays.

Having witnessed the making of aeroplane parts, the visitors went into a department packed with completed or nearly completed aeroplanes, and saw the method by which the 230 h.p. engines are finally fixed in position.

PERSONAL NOTICES.

NAVAL.

Deaths.

DIXON.—Flt. Sub-Lt. H. Dixon, D.S.M., R.N., was killed whilst flying at Ayr, N.B., on April 4th. He was 19 years of age.

GOODWIN.—Flt. Sub-Lt. Godfrey John Whitehouse Goodwin, R.N., who was killed on active service on March 12th, was the eldest son of Mr. and Mrs. John G. Goodwin, Rockside, Matlock, and was born Aug. 1st, 1898.

LOVE.—Flt. Sub-Lt. Harold Ewart Love, R.N., who was killed in an aeroplane accident in the East on March 28th, was the only son of Mr. and Mrs. Alfred James Love, "Forest Dene," 113, Poppleton Road, Leytonstone, E.11. He was 19 years of age.

MALLARD.—Flt. Sub-Lt. Norman Mallard, R.N., was drowned on March 30th whilst flying off the south-east coast. He was the only surviving son of Mrs. Mallard, of Westcroft, Ilkley, Yorks. Educated at Christ's Hospital, he joined the R.N.A.S. last July, on his eighteenth birthday, and was gazetted four months later.

Marriage.

MACLAURIN—GOODALL.—On March 27th, at Bembridge, I.W., Flt. Comdr. Clarence MacLaurin, of Quebec, Canada, was married to Frances Luisa (Pitita) Goodall, only daughter of Mr. and Mrs. J. M. Goodall, The Nest, Bembridge, I.W.

Birth.

ROSS MUNRO.—On March 29th, at 29, Elgin Mansions, the wife of Flt. Sub-Lt. Keith Ross Munro, R.N., youngest son of Mr. and Mrs. William Ross Munro, of Ross Roy, Indooroopilly, Brisbane, Queensland, of a daughter.

MILITARY.

Deaths.

BRICE HALLEY.—Sec. Lt. Clifford Richard Brice Halley, R.F.C., who was previously reported missing on Oct. 2nd, 1917, and is now officially reported killed in action on that date, was the only son of Mrs. Brice Halley, "Nut-Hall," Avenue Road, Crouch End, and of the late James Brice Halley, formerly of 15, Finsbury Circus, E.C. He was 19 years of age.

COLLIER.—Lt. Sidney Collier, M.C., Man. Regt., attd. R.F.C., was the youngest son of the Rev. and Mrs. S. F. Collier, of The Olives, Victoria Park, Manchester, and was killed in France in a fight in the air. He enlisted in Sept., 1914, in the Man. Regt., obtained a commission in Oct. of the same year, went to Egypt in April, 1915, and fought through the Gallipoli campaign, in which he was wounded, and in which he obtained the Military Cross for gallant conduct in the field, and was also twice mentioned in despatches. After the evacuation of Gallipoli he was on the Palestine front for a short time, returning with his regiment to France last year. A few months ago he joined the R.F.C., and after a brief training in England returned to France in March this year. He was 22 years of age.

CURTIS.—Sec. Lt. Ralph Luxmore Curtis, R.F.C., who was reported missing on Sept. 21st, 1917, is now officially reported to have died of wounds on that date, was the eldest son of Mr. and Mrs. W. Curtis, Berwick Ponds, Rainham, Essex.

ERSKINE.—A correspondent writes: "A message has been received by his squadron from the Austrian Flying Corps stating that Capt. Ralph Erskine, R.F.C., who was killed on January 1st last, was buried by them with full military honours at S. Fior di Sopra, four miles N.E. of Conegliano. Capt. Erskine was last seen chasing an enemy 'plane down and close on to its tail. It is not known whether he succeeded in bringing his opponent down; but his own machine was shelled by anti-aircraft guns and crashed out of control."

GORDON.—Capt. Cecil Philip George Gordon, South Staffs. Regt., attd. R.F.C., who was accidentally killed whilst flying at Gloucestershire on March 21st, was the only son of Col. Philip Cecil Harcourt Gordon, Army Medical Corps. He was 24 years of age.

GRANT.—Lt. Eric Duncan Grant, A.F.C., who was killed in a flying accident on April 4th, was the eldest son of the late Alexander Grant, of Melbourne, Victoria, and of Mrs. Alexander Grant, of 249, Cromwell Road, S.W. He was 20 years of age.

HALL.—Capt. D. D. G. Hall, M.C., Yorkshire R. and R.F.C., who died of wounds received while flying on March 26th, was son of Mrs. Upton Gaskell, and was 23 years of age. He had his commission in May, 1915, and was appointed temporary captain in July, 1917.

HOWELLS.—Lt. Edmund Sydney Howells, R.F.C., who was killed accidentally while acting as flying instructor on March 27th, was the eldest son of the Rev. E. Howells, B.D., vicar of Milford Haven. He was educated at the King's School, Worcester, where he represented the school on the river, and was passing from the Sixth Form to Oxford when the war broke out. He received a commission in the Welsh Regiment directly from the O.T.C., and served with it in France, being wounded in 1916. On recovery he returned to his regiment on another front, where he was transferred to the R.F.C., and served for some time in Egypt. Last year he was recalled to act as instructor at home.

HAY.—Lt. Hay, A.F.C., was flying off the Scottish coast on April 7th when his machine fell into the sea and he was drowned.

HUMPHREY.—Sec. Lt. Ernest Graham Humphrey, R.F.C., who died of wounds on March 29th, aged 21, was the son of the late Rev. W. J. Humphrey, formerly principal of Fourah Bay College, Sierra Leone, and of Mrs. Humphrey, of 23, Hereford Road, Acton, W. He was educated at Bedford Modern School, where he gained both entrance and leaving exhibitions. In October, 1914, he entered the City and Guilds (Engineering) College, South Kensington, and passed the intermediate B.Sc. (Engineering) Examination of London University in the following year. He joined the O.T.C. at school, transferred to the Senior Division at Kensington, and in 1915 obtained a commission in the South Staffordshire R. In July, 1916, he was sent to France, and subsequently was attached to the R.F.C. as observer. He had been wounded on two previous occasions.

JONES.—Lt. Cotterell Jones, R.F.C., has been killed through his aeroplane catching fire during a flight. The accident took place in the South of England.

JONES.—Lt. Evan Davies Jones, R.F.C., who was killed on April 2nd, aged 25, was the youngest son of Sir Evan Jones, Bt., of Pentower, Fishguard, Pembrokeshire, and 6, Addison Road, W. He was educated at Haileybury and Trinity College, Cambridge, where he graduated B.A. in 1915, and M.A. in January of this year. He was commissioned in the Royal Fusiliers on Aug. 14th, 1914, and subsequently transferred into the R.F.C., obtaining his pilot's certificate in September, 1917.

KENNEDY.—Capt. Douglas Stewart Kennedy, M.C., R.F.C., who was previously reported missing on March 12th, is now reported killed in action. He was the younger son of Mr. and Mrs. James Kennedy, Chaigmore, Broughty Ferry.

PAGE.—Sec. Lt. Dudley A. Page, Cheshire R. and R.F.C., who was previously reported missing, is now reported as having died of wounds on Aug 14th, 1917, whilst a prisoner of war. He was the younger son of the late Mr. Arthur Page and Mrs. Page, 140, Hill Lane, Southampton.

SPEAR.—Sec. Lt. Spear, R.F.C., a young Scotsman who came to England with the Canadians, was killed while flying in the north-eastern counties on April 1st.

WELCH.—Lt. George Frederick Welch, Indian Army, attd. R.F.C., who was killed on Feb. 11th, 1918, at Lahore Cantonments, Punjab, India, the result of a flying accident, was the only child of the late F. Welch and of Mrs. W. Ferguson Ducat, of Calcutta. He was 26 years of age.

WYATT—SMITH.—Sec. Lt. John Drummond Wyatt-Smith, Gen. List and R.F.C., who was killed on March 17th, aged 19, was the second son of Mr. and Mrs. R. Wyatt-Smith, of Gunton, O.R.C., South Africa, and Church House, Merrow. He was educated at Packwood Haugh and at Sherborne School, where he was a school prefect, head of his house, cadet officer, in the football XV., and captain of the XI. playing at Lord's last summer for the Public Schools. He joined the R.F.C. in August and obtained his "wings" early this year. He had only been a few days at the front.

Engagements.

GLOVER-SUMMERS.—An engagement is announced between Capt. J. W. Thomson Glover, Indian Infantry, attached R.F.C., son of the late David Thomson Glover and Mrs. Thomson Glover, Richmond, Surrey, and Cicely Phyllis, daughter of Mr. and Mrs. F. B. Summers, Froyle Place, Alton, Hants.

HUNT—WEEKS.—The marriage arranged between Lt. Arnold Hunt, R.F.C., son of Mrs. John Hunt, and Nancy Doreen, daughter of the Rev. C. C. Weeks, captain, R.A.M.C., and Mrs. Weeks, and granddaughter of the late Rear-Admiral Weeks, R.N., will take place at St. Hilda's, Crofton Park, on April 27th, at 2.30.

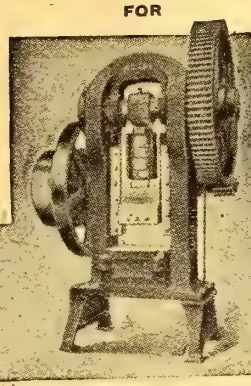
NICHOL-GELLATLY.—The marriage arranged between Capt. Frank Nichol, M.C., Loyal North Lancs. and R.F.C., youngest son of Dr. and Mrs. Nichol, of 1, Ethelbert Crescent, Margate, and Buddie, younger daughter of Mr. and Mrs. Gellatly, of Margate, will take place at St. Paul's Church, Margate, on Saturday, April 20th, at 1.30. No invitations will be sent, but all friends will be welcome at the church.

Marriages.

BISHOP—FREEMAN.—On March 30th, at St. John's, Palmer's Green, Capt. Percy Bishop, M.B.E., R.F.C., youngest son of Mr. and Mrs. Frank Bishop, of Hillingdon, Uxbridge, was married to Dorothy, youngest daughter of Mr. H. Freeman, The Cedars, Winchmore Hill, by the Rev. d'Arcy Preston, M.A.

SCOTT-HERVEY.—On April 2nd, at Selborne Parish Church, Capt. Frank Pilkington Scott, R.F.C., was married to Osyth, youngest daughter of the late William Hervey.

Capt. J. L. Trollope, R.F.C., was reported as missing about March 28th or 29th. Will any relatives of officers reported missing about the above date kindly communicate with Mrs. Howard Trollope, Banstead, Surrey?



Though it is not customary in this paper to give special publicity to the doings of individual pilots, it seems desirable to

Davis High-Speed Steel Furnaces

The Davis "D.H.S.T." series of Gas-Fired Furnaces have been specially designed for the hardening of modern High Speed Steel Tools, and to provide the maximum of convenience and efficiency at the least practicable fuel cost.

The fixing element consists of Davis PATENT Air-Blast Burners, for gas at ordinary main pressure and air at 3 lbs. per square inch. Two chambers are provided, each fitted with rise-and-fall door complete with counter-balance gearing and actuating levers. A pre-heating temperature of 1000°C is attainable in the upper chamber, the lower one reaching 1500°C; whilst the flame does not impinge on the work.

Illustration shows the D.H.S.T. 200 Series (working spaces from 11 ins. × 9 ins. × 4½ ins. to 21 ins. × 18 ins. × 9 ins. Prices from **£39** complete. Write for lists F18 A. B. & C. (gratis.)

THE DAVIS FURNACE COMPANY

Dept. —. THE DIAMOND FOUNDRY, LUTON, BEDS.

publish an account of an exploit by Capt. J. L. Trollope, R.F.C., firstly, because the bringing down of six enemy aeroplanes in a day is in itself a record which one believes, is unequalled by any other pilot in any of the belligerent flying services, and, secondly, because this officer is, unfortunately, reported as missing, and so the publication of his gallantry cannot be regarded as an advertisement. The following account is taken, with due acknowledgments, from the officially approved report of the Special Correspondent of the "Times" newspaper at G.H.Q. :—

"Capt. Trollope was out with a formation when they saw four German fighting aeroplanes trying to interfere with some of our observing machines. Capt. Trollope attacked one of the enemy, and fired into it from close range, when the German aeroplane fell all to bits in the air.

"The other three Germans scattered and got away, so, going on, Trollope soon espied two more enemy two-seaters below him, close to the ground. He dived at them, and engaged them one after another, and both went down and crashed, the fighting being so low that in each case their striking the earth was clearly visible. Capt. Trollope then climbed up to rejoin his formation, which was again engaged with another party of the enemy. He entered the mêlée, and used up what ammunition he had left, and came home for more.

"Having replenished, Trollope started out again, and met a party of three of the enemy trying to cross the battle line. He went for one of them, but his gun jammed, and he had to draw off till his gun got going again. Then he turned and attacked another of the enemy who was nearer than his original antagonist, fired into him at point-blank range, and the enemy went down spinning and then broke into pieces.

"Turning from his last victim, Capt. Trollope then went after the third of the enemy party, caught it up, attacked it, and the German broke into flames in the air. This made five of the enemy shot down in a single day, and Trollope turned for home. But on the way he saw another enemy scout attacking one of our slower machines.

"He went to the rescue, and tackled the enemy, who went down spinning, and the other pilot saw it crash hopelessly into the ground. It was altogether a most brilliant performance, and that so gallant a man should now be missing will be a matter of universal regret."

* * *

Will repatriated officers and men who may have seen Lt. Streather, R.F.C., in Germany, please write to his mother at D'Arcy House, Finchley Road, Golders Green, N.W.?

AIR FORCE.

Deaths.

BURTON and PAYNE.—Lt. Burton, R.A.F., an Australian, and Lt. Payne, R.A.F., came into collision while flying at Montrose on April 4th. Their machines spun to the ground, and both aviators were killed.

CHRISTIE.—The death in hospital is announced of Sec. Lt. David Christie after a flying mishap on the north-east coast.

ENGLAND, HACKMAN, and CRAIGIE.—A triple flying fatality occurred near Chichester on April 7th. Sec. Lt. Norman Herbert England, R.A.F., and Sec. Lt Clifford Hackman, R.A.F., were in a dual control machine, and Sec. Lt. Victor R. Craigie, R.A.F., was in another machine. About 300 feet from the ground the two machines came into collision and fell. When assistance arrived, it was found that Mr. Craigie and Mr. Hackman were dead. Mr. England died on the way to the hospital.

HUGUENIN, SEIFERT, and KRAUTMAN.—On April 3rd, at an aerodrome in Lincolnshire, one machine crashed into another which was stationary on the ground, and Lt. S. Huguenin, an American, recently of Wisconsin, U.S., Corporal B. J. Seifert, and Pte. N. Krautman were killed. A fourth man was badly injured.

MOORE.—Lt. J. G. Moore, who recently arrived from India, was killed in a flying accident on April 2nd at an aerodrome in Lincolnshire.

TUCKER and DUNLOP.—Two young flying officers, Sec. Lt. H. C. Tucker, R.A.F., and Sec. Lt. H. S. A. Dunlop, R.A.F., were killed on April 4th while flying in the East Midlands. Their machine nose-dived and fell. Mr. Tucker was an experienced aviator, and was acting as instructor. Mr. Dunlop came from Scotland.

Engagements.

COOK—DISNEY.—An engagement is announced between Capt. Charles Cook, R.A.F., and Miss Disney, only daughter of Norton Disney, of The Hyde, Essex.

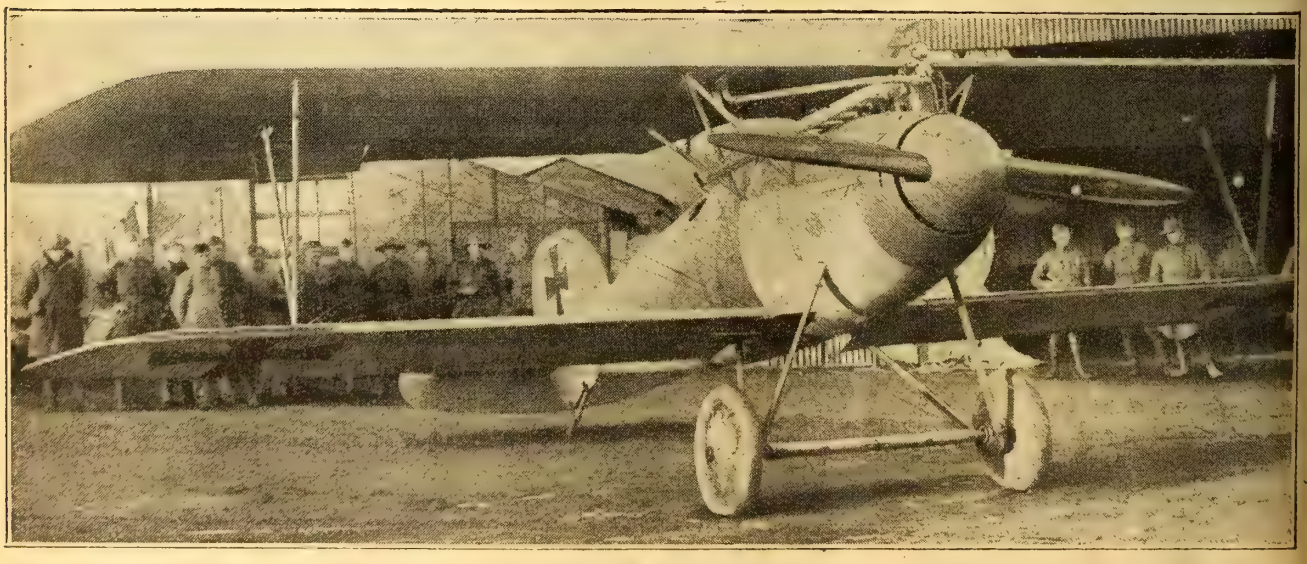
GROVER—PATTERSON.—A marriage has been arranged between Lt. George W. M. Grover, R.A.F., only child of the late George Grover and Mrs. P. Samuelson, and Josephine W. (Joan) Patterson, twin daughter of Mr. and Mrs. W. R. Patterson, of Sorrento Lodge, Ryde, lately of 40, Cleveland Square, Hyde Park, London.

Marriages.

GREEN—ROSKILLY.—On April 2nd, at the Catholic Apostolic Church, Camberwell, Capt. John Spencer Green, M.C., R.A.F., eldest son of Mr. and Mrs. E. S. Green, of Herne Hill, was married to Beatrice Louise, eldest daughter of Mr. and Mrs. E. A. Roskilly, of Forest Hill.

HEBDEN-PHILLIPS—PEARS.—On the 6th inst., at Holy Trinity Church, Tulse Hill, Sec. Lt. Evelyn Henry Hebden-Phillips, R.A.F., second son of Mr. and Mrs. Cornelius Hebden-Phillips, of Dover and Sudbury, Canterbury, was married to Muriel, only daughter of Mr. and Mrs Ernest Pears, 77, Christchurch Road, Tulse Hill, by the Rev. H. Woffindin, M.A., Vicar, assisted by the Rev. F. McConnell, M.A.

LIVINGSTONE—COOPER.—On 2nd inst., at St. John the Evangelist, Edinburgh, Capt. Alexander F. Livingstone, R.A.F., eldest son of the late Frederick Livingstone and Mrs. Livingstone, 33, Queensborough Terrace, Hyde Park, was married to Jeanette Margaret Graham, younger daughter of Alexander H. Cooper, W.S., 54, Manor Place, Edinburgh, and West Glenturret, Perthshire, and the late Mrs. Cooper, by the Rev. Canon Terry.



WAIN—FORREST.—On April 4th, at St. George's, Hanover Square, by the Rev. F. Monteath Jackson, R.N., Capt. William Donston Wain, R.A.F., was married to Nesta Sybil, daughter of the late Robert Forrest and Mrs. Forrest, New Court, Marlow, Bucks

FOREIGN COMMUNIQUES.

FRANCE.

Official Communiqués.

April 2nd.—Last night two groups of German aeroplanes crossed our lines flying in the direction of Paris, and were signalled by our watching posts. The alarm was given at 3.3 a.m. Our batteries opened a violent fire against the enemy machines, which were compelled to turn back. Some bombs were dropped in the outskirts, but there were no casualties and

no serious damage was caused. The "All Clear" signal was given at 4.20 a.m.

April 3rd.—On March 31st and April 1st our squadrons dropped 12,000 kilogrammes (about 12 tons) of explosives on the railway lines and cantonments of Ham, Chauny, Noyon, etc. A great fire broke out at the railway station of Chaulnes.

Enemy cantonments in the region of Roye were plentifully bombarded with machine-guns from a low altitude.

Our avions de chasse fought numerous engagements, in the course of which eight German machines were brought down, while two others were destroyed by means of anti-aircraft guns.

April 4th.—Army of the Orient.—"Allied aviators carried out successful bombing raids, notably on Berat (Albania)."

April 5th.—On April 3rd five enemy aeroplanes were brought down, one of them by our machine-gun fire. In addition a German captive balloon was set on fire by one of our machines. During the night of the 2nd and during the day on the 3rd our bombarding machines made numerous raids. Twenty-three thousand kilogrammes (about 23 tons) of bombs were dropped on enemy cantonments, railway stations, and other establishments. Fires were observed, especially in the railway stations of Laon and St. Quentin.

It is confirmed that five more enemy aeroplanes were destroyed by our pilots on March 27th, 31st, and April 1st, and 2nd.

April 7th.—On April 6th seven German aeroplanes and two captive balloons were brought down by our pilots.

Our bombing machines dropped 5,000 kilogrammes (about five tons) of projectiles on the stations and contonments in the Roye region.

Army of the Orient.—Two tons of explosives were dropped by Allied aviators on enemy establishments.

April 8th.—Army of the Orient.—Enemy cantonments at Demir-Hissar were bombed by British aircraft.

GERMANY.

Official Communiqués.

April 2nd.—Yesterday 22 enemy aeroplanes and five captive balloons were shot down. Lt. Kroll won his 23rd aerial victory.

By the energetic carrying out of long-distance observation from the coast as far as south of the Somme, Aerial Detachment No. 3, under the command of First Lt. Friecke, rendered extraordinary service.

April 3rd.—Rittmeister Baron von Richthofen won his 75th aerial victory.

April 7th.—In aerial battle 18 enemy aeroplanes were yesterday shot down. Rittmeister Baron von Richthofen gained his 76th and Lt. Udet his 24th aerial victory.

April 8th.—Rittmeister Baron von Richthofen achieved 77th and 78th aerial victories.

ITALY.

Official Communiqués.

April 2nd.—Along the whole front the bad weather hinder aerial activity.

April 4th.—Our aviators set fire to an enemy captive ballo in the vicinity of Valdobbiadene (north of Montello). Duri the night they bombarded the railways in the Val Lagarina.

April 5th.—British aviators brought down three ene machines above Cismon (Brenta); a fourth was compelled to la near Strigno (Val Sugana).

TURKEY.

Official Communiqué.

April 4th.—As reprisals for the attacks carried out on Ma 25th by enemy aeroplanes against the open town of Esine, n aeroplanes bombed, during the night of April 1st-2nd, the p establishments in the island of Tenedos.

BULGARIA.

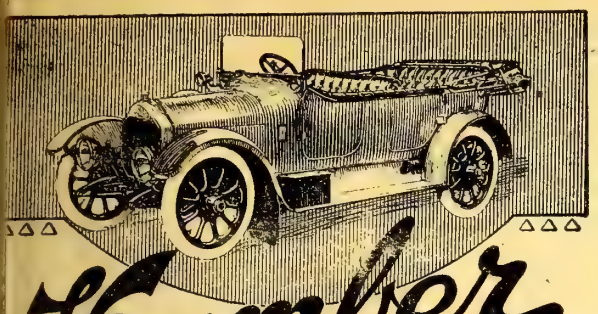
Official Communiqué.

April 5th.—In the Tcherna bend a French aeroplane brought down in an air fight, and fell behind the Bulgar lines.

THE WAR IN REVIEW.

The "Times" correspondent, writing from Paris on April says:—

The battery of 210 mm. (8.4 in.) guns which bombards P consists, or consisted—for one gun has already ceased to exi of at least two, and perhaps four, pieces.



Directly a shot is fired French heavy batteries concentrate the emplacement, while aviators rain bombs on it. M. Cha Nordmann, the astronomer, states in the "Matin" that the which bombarded Paris last week has been move l a distanc a mile and a quarter from its original station. It is now miles from the capital. As these guns are mounted on rails change of position presents no great difficulties.

On the other hand, from the French standpoint, it is extren difficult to spot their position by photographs, because of enemy aeroplanes which hover round. Moreover, the gun last week—"Bertha," as it is called—is eight miles within German lines, and in order to find high ground from whic bombard her the French heavy guns must be placed some t

ACCURACY

to the ten-thousandth part of an inch

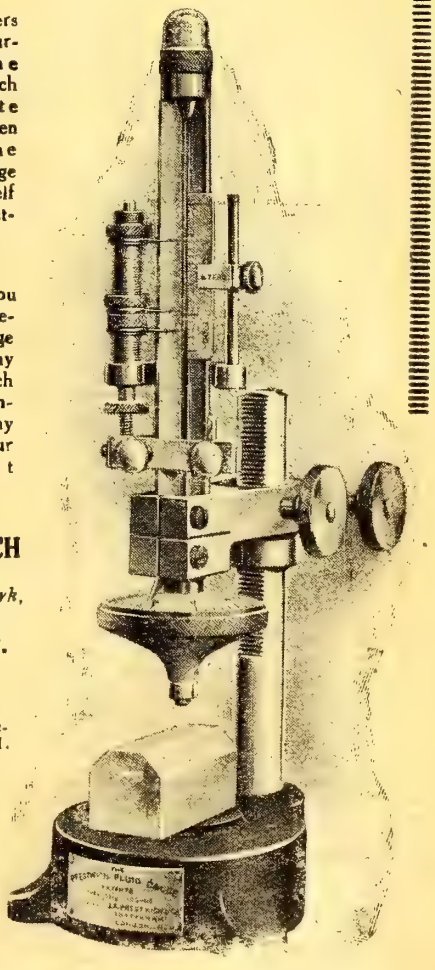
WITH EASE

Micrometer and Special Gauges wear quickly and are subject to misuse producing inaccuracies which pass unnoticed, but often lead to disputes between viewers and inspectors.

These difficulties are overcome by the use of The Prestwich Fluid Gauge, which has no wearing parts, and entirely eliminates the sense of touch. The Prestwich Gauge shows immediately if the work is "within the limits," it magnifies an error 1,000 times, thus limits of $\frac{1}{1,000}$" are visible to the eye as 1", and can be noticed by the most unskilled operator.

The Prestwich Fluid Gauge
Accuracy to the ten-thousandth part of an inch with ease

indicates the exact amount of any error and readings may be taken to $\frac{1}{50,000}$ part of an inch, at the rate of 60 per minute if necessary.



Think what this means when a quantity of work has to be gauged to a standard. Think of the saving in time and money made possible by the use of the Prestwich Gauge in your factory.

Hundreds of users have been surprised at the simplicity to which their intricate gauging has been reduced. The Prestwich Gauge will prove itself a profitable investment for you.

May we send you full particulars regarding the Gauge itself, and the many adaptations which have been constructed? Why not write for our illustrated booklet to-day?

to four miles in the rear of the French front. It is, therefore, no easy task to silence "Bertha." Gas shells have proved most effective in such work hitherto.

M. Nordmann thinks it probable that a decoy gun is fired simultaneously with the big piece. Needless to add "Bertha's" position is carefully hidden. She lives in a tunnel, and never fires at night, lest the flash might betray her

* * *

A message from Paris, dated April 5th, states that in the recent French raids on Karlsruhe bombs fell on the station, which was severely damaged. Forty persons were killed and about 100 wounded. At Trêves a munition factory was blown up. There were a number of victims and much damage was done.

At Metz-Sablons the French bombs damaged eight locomotives and hit a munition train, which was blown up. A gasometer was also blown up. Several wagons loaded with explosives caught fire, and 50 people were killed.

* * *

Mr. Patrick Devitte, the "Daily Express" correspondent at Geneva, writes on April 5th:—

According to news received at Basle the British air raid on Cologne caused 248 deaths. Half of this number were soldiers who were in the troop train which was damaged by the aviators' bombs. The train was standing in the station waiting to start for the Western Front. The raid caused an indescribable panic, which lasted for 12 hours.

* * *

At a ceremonial presentation of War Medals at the Scala Theatre at Milan recently the High Commissary made his first speech on the matter which he is appointed to manage, to wit the supplies of aeroplanes and the means to use them efficiently for the extinction of the Boche peril.

His Honour said that the dominating force in the air is not that of the enemy on this front. He then told us that a Caproni had bombed Metz. Mentioning the silk scandal, he said according to the papers, that "we still have silk for our wings but the enemy has not."

* * *

A long Rome semi-official of March 23rd, dealing with dirigibles, says in concluding:—

"Altogether between the 11th and 19th of March our dirigibles and those of the Royal Navy dropped about 14 tons of high explosives on exclusively military objectives in zones protected

by noteworthy A. A. forces. This growing activity in face of the growing difficulties of dirigible action (height questions?—T.S.H.) shows the courage, skill and self-sacrifice of the valiant dirigibists and the progress made in the use of airships.

* * *

The conferring of the Gold "for valour" medals on Lt.-Col. Piccio, Maj. Baracca and Capt. the Prince Ruffo di Calabria, by the still convalescent Gen. Rossi, appears to have been a great moment for all present, among whom were the Officer Commanding the French troops of the district, the representative of the Allied Nations, and Maj. R. C. Whitehead, M.C., R.F.C.

* * *

It is reported by the Christiania journal, "Tidens Tegn," that a Zeppelin was lost outside Jæderen, Norway, apparently after having been hit by a British warship.

* * *

A Danish seaplane was lost on April 6th in the Kattegat, and two officers were killed.

* * *

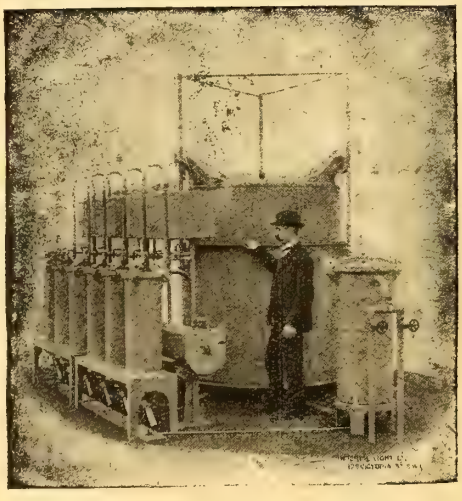
Secretary Daniels, of the U.S. Navy, in a speech at Cleveland, Ohio, said:—

"Aviation bases have been established in Europe, and members of the Naval Flying Corps have been for months in active service. The first of the regular armed forces of the United States landed in France were naval aviators, who arrived on June 8th. Our aviators are co-operating with those of England, France, Italy, and Portugal."

* * *

The "Times" states that Mr. Baker, United States Secretary for War, has accepted the offer of the Eastman Kodak Company, of Rochester, N.Y., to provide without charge temporary accommodation for an army school of aerial photography where a thousand men can be trained every month. It is hoped that 4,000 or 5,000 men will be trained before August

A ROYAL VISIT.



On Monday, March 25th, Her Majesty Queen Alexandra, accompanied by Her Royal Highness Princess Victoria, and attended by the Honourable Charlotte Knollys, the Honourable Violet Vivian and Sir Arthur Davidson, visited the works of Handley Page, Ltd. The party was received by Colonel Davson, representing the Air Council, Mr. F. Handley Page, and Mr. Theodore Handley Page. An inspection was made of the works, especial interest being taken in the work of women.

DEFERRED CONGRATULATIONS.

The following telegram received from the Secretary of State for the Air by the Regent Carriage Co., Ltd. :—

Secretary of State for Air and Air Council ask me to convey to your firm, your staff and workers their sincere thanks and appreciation of your able efforts during the past 6 months, which have enabled the Royal Air Force in the field to receive such satisfactory supply of aircraft equipment, and to make good their losses so well, through the unexampled fighting of last months.—(Signed) General Alexander, C.S.D. Aero Supply.

THE PEMBERTON-BILLING LIBEL CASE.

Those who are interested in the career of Mr. Pemberton-Billing, M.P., on account of his services to Naval and Military aviation may be desirous of following in detail the libel action in which he is now involved, especially as it is likely to have far-reaching results. A verbatim report of the case is to be published week by week by "The Vigilante," and copies may be obtained for 6d. post free from the offices of the Society of Vigilantes, 5, St. James's Place, S.W.1. As the newspaper reports are necessarily curtailed, and frequently edited with bias, the verbatim report is likely to be of historical value.

WAR SAVINGS AND THE R.A.F.

The number of War Savings Associations in the Army is creasing. Between Dec. 1st, 1917, and Feb. 28th, 1918, a per of three months, the men of the 1st Corps of the British Ex ditionary Force in France invested £253,120 in War Savi Certificates. It is officially stated that in order to stimulate sav in the Army permission has been given to name aeroplanes a the regiments whose War Savings Associations subscribe £2,500 that is necessary to purchase one.

This idea seems to provide an interesting sentimental link tween the Royal Air Force and the British Army, which is dominant parent, and, at the same time, the object which protects

THE SHEMUS.

The new women's service, which has been formed to rele men in the Royal Flying Corps, will be known as the Wome Royal Air Force. Unofficially it may become known as eit the Shemus or the Penguins. The objection to the w Penguin is that it is already applied to gentlemen otherw known as "Tarmac pilots."

Lady Gertrude Crawford, who has been appointed as head, will be known as Chief Superintendent.

1131

The terms of service and conditions are based on those of the W.A.A.C. and the W.R.N.S., and recruits must enrol for the duration of the war. About 300 officers are required, who will be enrolled by the Professional Registry, Queen Anne's Chambers, and the ranks will be recruited by the Ministry of Labour Employment Bureaux or recruiting offices.

The uniform has not yet been decided upon, but it is practically settled that it shall be of khaki and similar to that of the W.A.A.Cs. At present the force will be largely immobile, but a mobile section will be formed, and the ranks will live in hostels at the stations to which they are attached.

Lady Gertrude Crawford is the daughter of the fourth Earl of Sefton and sister of the present peer. She married in 1905 Lt.-Col. J. H. Crawford, Indian Army. She is a master turner, and has been engaged in practical munition work since the early days of the war, having been associated with Lady Moir in an enterprise to bring educated women into munition factories.

THE INVASIONS OF ENGLAND.

The Commissioner of the Police states that when an air raid warning is received between sunset and the time fixed for drawing blinds, all lights must at once be obscured.

In view of the coming into force of "Summer" Time t following new times for drawing blinds in London are issued :-

	p.m.
April	9. 0
May	9.30
June-July	10. 0
August 1st-15th	9.30
August 16th-31st	9. 0
Sept. 1st-15th	8.30
Sept. 16th-29th	8. 0

Lights must remain screened till an hour before sunrise Summer Time in each case.

MORE AIRCRAFT PAY

In regard to a recent claim made to the National Engineeri Federation by the National Federation of General Workers Committee on Production has approved of the payment of 1 per cent. to plain-time workers in federated establishmer throughout the kingdom who are wholly engaged in the ma facture of aircraft or aircraft parts.

ON THINGS BEHIND THE SCENES.

Amongst the soldiers this is muttered,
That here you maintain several factions;
And, whilst a field should be dispatch'd and fought,
You are disputing of your generals,
One would have lingering wars with little cost;
Another would fly swift, but wanteth wings;
A third thinks, without expense at all,
By guileful words peace may be obtain'd.

—*Henry VI.*

In a brilliant letter published in the "Morning Post" on April 10th, Lord Esher showed how in Wellington's time faint-hearted politicians, place-hunters, and intriguers for and on behalf of themselves or the King's enemies hampered the Armies in the field by their squabbling. By way of showing that even a hundred years and more ago such intrigues and treacheries were not new, Lord Esher quoted the wonderfully apt passage from *Henry VI* which appears at the head of this column.

The fact that Shakespeare should have put such words into the mouth of the Messenger to the War Office from the B.E.F., of 1422 A.D., shows that even at the end of the Sixteenth Century these things were not new, and were considered fitting to the early years of the Fifteenth Century.

The astonishing appositeness of the quotation at this particular moment is increased when one recalls the opening of the Messenger's speech to the assembly at Westminster:—

My honourable lords, health to you all!
Sad tidings bring I to you out of France,
Of loss, of slaughter, and discomfiture.

and his closing words:—

Awake, awake, English nobility!
Let not sloth dim your honours, new begot:
Cropp'd are the flower-de-luces in your arms;
Of England's coat one half is cut away.

Those who will take the trouble to read the first part of Shakespeare's play, entitled "King Henry VI," will find much more of a like nature, showing how we in this country have changed not at all since the days when the weak King Henry VI lost all that had been won by King Henry V at Agincourt. Then the intrigue and graft and treachery was carried on by territorial lords instead of by financial magnates and politicians. Truly history is the greatest plagiarist of all authors.

Union Which Is Not Strength.

We have been told, ever since, under pressure from that well-meaning but mistaken body the Parliamentary Air Committee, the weakest of our Premiers, Mr. George, decreed the unification of the two Flying Services into the Air Force, that union would mean strength, that removal of competition would prevent intrigue, and that perfect internal peace would permit the combined Air Force to meet all assaults with ease.

And the truth is that never since flying began has intrigue and jealousy been so great a danger to our strength in the air as it is to-day.

Some few days ago an amazingly fatuous circular was sent out to the press from some department of the Air Ministry, prating about the unity and brotherly love which would follow on the amalgamation of the staffs in the Hotel Cecil. It was said, for example, that by amalgamating two departments the best man in both would be available as chief of the combined single department. Only an utter innocent or an astounding hypocrite could have delivered himself of such a dictum.

The Hôtel Bolo.

It is not without reason that the Hotel Cecil has won for itself among Service people who, for their sins, have dealings in it the nickname of the "Hotel Bolo." The name was given long ago, before the passing of the lamentable Air Force Bill. The explanation given by the Service people themselves was that everybody in the place was either actively interfering with the progress of the war, or else was merely looking on as a neutral.

Naturally the statement was an exaggeration, as such jests are bound to be, but there was enough truth in it for the name to stick to such an extent that when other premises were commandeered in order to house the ever-growing staff of meddling and muddling officials the extensions of offices were duly labelled "Bolshevik Mansions," "Soviet Chambers," and finally, as a last blow, "Trotsky Rents."

The Beauties of Competition.

How this Utopian unification works in practice may best be understood from a simple illustration concerning a purely imaginary department.

Let us suppose a special department dealing exclusively with brass tacks, just as other departments deal with aero-engines, fabric for wing-coverings, dope, timber, etc.

In the old days the Brass Tack Dept. R.N.A.S. was in open competition with the B.T.D. R.F.C. Lieut. Jones, R.N.V.R., B.T.D. R.N.A.S., was all out to get the best possible brass tacks in the largest possible quantities for R.N.A.S. aeroplanes and seaplanes.

Capt. Smith, R.F.C., O.C., B.T.Dept., Royal Flying Corps, did likewise, but was probably hampered by the fact that the Royal Aircraft Factory's "experts" advised the Technical Dept. R.F.C. that tacks of duralumin or of manganese-bronze—with .004 per cent. of chromium as an added alloy—were preferable. Also probably the Aeronautical Inspection Dept. rejected 95 per cent. of his manganese-chromium-bronze tacks because the heads were two four-thousandths of an inch under or over size, and the radius from shank to head was not strictly to gauge.

Consequently Lieut. Jones, R.N.V.R., practically

made a corner in brass tacks, and when the R.F.C. found itself without any tacks at all with which to keep the fabric on its wings or the three-ply on its fuselages, it then went to the Air Board and begged that the Air Board would use its influence with the Admiralty to allow some of Lieut. Jones's brass tacks to be allocated to the R.F.C. And so the R.F.C. got what it wanted.—As a matter of cold plain history, something very like that actually accounted for the R.F.C. getting hold of a large supply of Sopwith "Pups" at a very critical moment in its affairs.

The Weakness of Union.

Now, however, we have a beautiful unified service. Lieut. Jones, R.N.V.R., becomes Capt. Jones, R.A.F. Capt. Smith, R.F.C., becomes Capt. Smith, R.A.F. The two Brass Tack Departments are amalgamated into one. Capt. Jones and his second and third in command are certain that they ought to run it, because they produced the brass tacks which saved both the Services in their hour of need. Capt. Smith and his subordinates are equally certain that they ought to run it, because they are used to handling the millions of forms invented by the A.I.D., and the Technical Dept., and the departments of the D.A.S., and the D.G.A.P. and the T.1 to T.*nth* departments, with which Capt. Jones, as a Lieut. R.N.V.R., never had to deal at all.

After all it is much more important to be able to fill up forms properly than it is merely to deliver the goods. At least so all Government Departments believe.

Anyhow, Capt. Jones and Capt. Smith, and all their subordinates, start out on a kind of electioneering campaign, all round the innumerable corridors and cubby-holes of the Hotel Bolo, to canvass for the help of those having influence with the High Authorities, to the end that their gang may be made chiefs of the B.T.D., R.A.F.—or of the B.T.D., Aeronautical Supplies Dept., Air Ministry, as one supposes it would be. This canvass, and the various squabbles involved, makes it impossible to fill in forms, or sanction contracts, or anything else.

And so all the Brass Tack Industry finds itself without orders from the Air Ministry, and turns its plant over to making a different type of brass tack, to the orders of the newly formed Ministry for Providing Furniture in Government Offices, or something of that sort which has been started to provide a well-paid job for one of Mr. George's friends, or for someone who happens to know rather too much about someone or other in or connected with the Government. As a humorous M.P. put it not long ago, the best way to get a good job is either to have a friend on the Front Bench in the House of Commons, or else to "know where the baby is buried."

However, to revert to Captains Jones and Smith, R.A.F., the net result of the unifying of their departments is that they and their staffs are so busy trying to avoid being pushed out of their cosy office over to a nasty place called France, where there is a war on, that the R.A.F. doesn't get its brass tacks. And as Shakespeare said:—

"'Another would fly swift, but wanteth wings."

Then probably the D.G.A.P. steps in, throws them both out, and appoints a capable business man to do the job. And the business man has to spend a solid six months learning his new work. After which he has to get the Brass Tack Industry back again to its old organisation for turning out aeroplane tacks instead of upholstery tacks.

In fine, we have abolished healthy competition between two Services, and have instituted a system in which internal disagreements absorb more energy than did the clean competition which existed before.

The Danger of Single Departments.

Even the cleverest man makes mistakes, so, quite apart from all these evils of intrigue and internal squabbling, there is the constant danger that a mistake in one department may land us without aeroplanes of the quality necessary to meet the enemy in the air with success.

The mere existence of an "opposite number" in a rival service was a kind of insurance policy against the danger of such mistakes.

Both the R.N.A.S. and the R.F.C. made the most astonishing blunders in the choice of machines and engines, but they never both made the same mistake at the same time. Consequently, one was always able to save the other from complete disaster. Under the present unified system the Technical Department is quite likely to turn down the very machine or engine which would save the situation. One has only to look at the mess which has been made of the supplies of timber and of linen fabric to see the danger of allowing any one department to handle either designs or supplies entirely by itself.

It is not even safe to have a single string of departments arranged in series, on the theory that when a design has passed by the Technical Department its defects may be discovered by the Supply Department or the Equipment Department. That merely means more and more delay in getting the design through. The only safe method is parallel departments actually in competition.

The Vital Necessity of Competition.

Even in operations the same argument holds good. It was the R.N.A.S. people at Dunkerque who developed the use of the big bombing machines for night work, and the smaller and faster bombers for day work. If it had been entirely in the hands of the R.F.C. people at home, everyone would still be bombing on Feeplanes and R.Es. simply because there would have been no "opposite number" to apply the spur of competition.

In fact, but for the spur of competition applied by the R.N.A.S. the R.F.C. would probably have nothing to-day except F.Es. and R.Es. and B.Es., for it was the R.N.A.S. which produced all the first Sopwiths, and Nieuports, and Handley-Pages, and le Rhônes, and Rolls-Royces in the field. The R.F.C. was thus spurred on to produce the later Bristols, de Havillands, and Martinsydes, and B.H.Ps., and so forth. The more one sees the more one is convinced that competition is vital to the welfare of the Flying Services.

ON DISPUTING OF OUR GENERALS.

To-day, at what is probably the real turning-point of the war, we find ourselves, as in the days of Henry VI, disputing of our generals. Again we are shown that this precious R.A.F. combination, so far from bringing unity, peace, and efficiency, has only brought additional intrigue, disunion, and discord.

On Sunday last everyone concerned with Service aviation was staggered by the announcement that Sir Hugh Trenchard had resigned the post of Chief of the Air Staff and that Major-General F. H. Sykes, C.M.G., had been appointed in his stead.

It has been known to all who have been at all closely in touch with affairs behind the scenes that intrigues between several different factions have been going on ever since the Air Ministry was formed, the objects of the intrigues being to put this, that, or the other

individual or faction into power. In fact it has been more more or less a case of Captain Jones *versus* Captain Smith all over again, only very much higher up.

Rumours and More Rumours.

It has been said that there was an intrigue among the soldiers to "out" Lord Rothermere. Also that there was a scheme among the older hands of the R.N.A.S. and R.F.C. to get rid of Lord Rothermere and Sir Henry Norman, and put in a soldier as Air Minister. Another yarn had it that another clique backed by Mr. Bonar Law was busy trying to get General Henderson made Air Minister. Yet another story said that the Navy people were out to capture the administrative control, and that the soldiers would resign if they did so:—Some colour was given to this story by the mysterious appointment of certain elderly Naval officers to high commands over big districts where their subordinates will all be experienced and energetic young soldiers to whom Naval notions of administration must be alien.

Another story again insisted that Lord Rothermere was going anyhow, that Sir Henry Norman was to take his place, and that all the Service people objected more or less unanimously. Still another story said that Sir Henry Norman had displayed remarkable ability and a wonderful grasp of the problems of Service aeronautics, and that many of the Service people were strongly in favour of his taking over complete control of the Air Ministry.

There were all the usual party cries that somebody must go. "Rothermere must go," because he cannot grasp the ideas or needs of aviators. "Henderson must go," because he is too closely connected with political people. "Norman must go," because he is too fond of interfering with the various interests, both civil and Service, of producers and users. "Trenchard must go," because he rides rough-shod over everybody else's ideas. And so forth and so on, *ad nauseam*.

The Evils of Intrigues.

It was all very paltry, very disgraceful, and above all very dangerous at this critical stage of affairs, for all these rumours dispersed outwards among the training brigades and the active service squadrons, and gave rise to a feeling of unrest and uncertainty at the very time when everyone should have been working at the highest pressure sustained by the feeling that all was well at Headquarters and that the people at home were concentrating their utmost energy on the needs of the people in the field. Instead of this feeling that all is well it has come about that:

"Amongst the soldiers this is muttered,
That here you maintain several factions
And, whilst a field should be dispatched and fought,
You are disputing of your generals."

Of General Trenchard.

So far it has not been made known what Sir Hugh Trenchard is to do, now that he has ceased to be C.A.S. Doubtless his next appointment will be announced in due course. He is too big a man to be quietly Stellenbosched, and he is too energetic a man to be kicked upstairs to oblivion by promotion to higher rank without a command.

Major-General Sir Hugh Montague Trenchard, K.C.B., D.S.O., was born on February 3rd, 1873. He entered the Royal Scots Fusiliers through the Militia in 1893, and became captain early in 1900. He had meantime seen service in South Africa with the Imperial Yeomanry, Bushmen's Corps, and afterwards with the Canadian Scouts. While serving with the latter he was dangerously wounded. In this war he qualified for the Queen's medal with three clasps and the King's medal with two clasps.

He became brevet major in 1902, and served with the West African Frontier Force between 1903 and 1910. Here he rose to be commandant of the North Nigerian Regiment in 1908, having previously been mentioned in dispatches and having gained the D.S.O. in 1906. With the West African Frontier Force he received a medal and three clasps.

Towards the end of 1912 he became Chief of Staff, with the grade of squadron commander, at the Central

THE MEN WHO DO THE WORK.—A group of fighting pilots and machine-gunners at the Front. Each of them is guaranteed to have brought down at least three Huns.

Flying School, Captain Godfrey Paine being Commandant, and was promoted a year later to assistant commandant.

At the outbreak of war in 1914 he became Commandant of the Military Wing R.F.C. In 1915 he was promoted, first, lieutenant-colonel (January 18th), then colonel (June 3rd), with, later, the temporary rank of brigadier-general.

He held this rank from August 25th, 1915, to March 23rd, 1916, when he became major-general (temp.).

In June, 1915, he became A.D.C. (extra) to the King and brigade commander a month later.

After a long period of distinguished service in France he became a member of the Air Council as Chief of the Air Staff when the Council was constituted last January, and has thus been intimately associated with the task, now, unfortunately, only too complete, of amalgamating the two Flying Services in the Royal Air Force.

General Trenchard made the R.F.C. what it is. By sheer magnetic personality and strength of character he held together the *moral* of the Corps in 1915 and 1916, when, thanks to General Henderson's disastrous error in staking the welfare of the Corps on the supply of aeroplanes and engines designed by the Royal Aircraft Factory, the Fokker and the Albatros machines in turn fairly dominated our aviators at the front. Even now we have not recovered from General Henderson's mistake, for we are landed with vast quantities of obsolete and obsolescent R.A.F. machines and engines as a result, when the same labour and material could have produced much greater numbers of much better aeroplanes.

Yet despite these drawbacks General Trenchard made the R.F.C. into the finest fighting machine in the world, not excepting even the German Army. He has made mistakes, as every other great man has made them. He has broken good men and he has promoted men who afterwards turned out to be failures. But such mistakes have been rare, compared with similar mistakes made by others.

His enemies—who are not a few—say that General Trenchard is a Bismarck, and uses Prussian methods. Those who know him best know that his kindness of heart is his greatest weakness. The fact remains that the R.F.C. in the field worship him, and that his appointment as Chief of the Air Staff was the one thing which gave the Corps hope for the future of that much disliked hermaphrodite affair which is called the R.A.F.

If General Trenchard leaves the R.A.F.—unless, that is to say, he can induce the Army Council to slap the faces of the politicians by reviving the R.F.C. as a purely military concern—the effect must be very grave.

The R.F.C. has full faith in General Salmond, who is a most capable commander in the field and an able administrator at home, but when the Corps sees its idolised Chief turned out at the bidding of politicians it is bound to wonder what is to be its own fate as a fighting force, and who among its leaders is to be safe against intrigues.

While such things are permitted, it is little wonder that belief grows in the existence of a Hidden Hand which grips the Government and compels the removal of any man who seems to be in danger of winning the war against the German friends of our politicians and international Jew financiers.

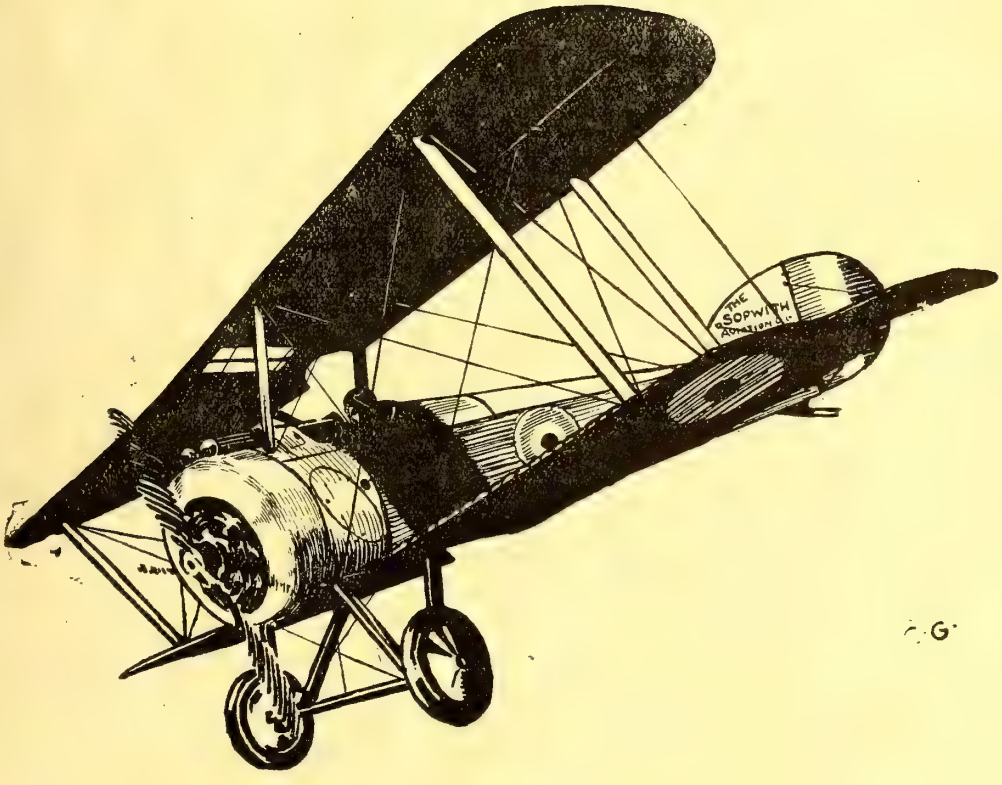
Of General Sykes.

General Sykes' will be a new name in these days to the great majority of Service aviators, yet he was one of the pioneers of Service aviation. He began his military career as a trooper in Lord Roberts' bodyguard in the South African war. Thence he obtained a commission in the 14th Hussars. He devoted himself to Staff work, and so has not held a command in the field as an Army officer.

His personal bravery is beyond dispute, as those who served with him in India can vouchsafe. He is credited with being one of the only two or three men who have ever walked from Pekin to Simla, via Tibet and the Himalayas—or by any other route, for that matter. He learned to fly on a Bristol biplane at Brooklands in 1911, his certificate being No. 95, dated June 6th, 1911, and though never claiming to be among the first-class pilots he has probably done vastly more flying as a pilot than anyone of his rank, except one major-general of the R.A.F. He did practically all the organisation work of the R.F.C., and commanded the Military Wing of that corps until the outbreak of war, when General Henderson took command in the field.

He went to France with the R.F.C. in 1914, as Chief of Staff to General Henderson, and it is said that he and his chief were by no means unanimous. Therefore it seems unlikely that his appointment as C.A.S. was made by General Henderson's political friends. It has, however, been rumoured for some time that General Sykes was coming back to aviation with greatly increased powers, though no hint was given as to the precise post.

In May, 1915, as a lieutenant-colonel in the Army, he went to the Eastern Mediterranean to report on the air work of the R.N.A.S., which at the time was fairly futile, thanks chiefly to mishandling of *matériel* and designs in the Air Department of the Admiralty. As the result of this report Colonel Sykes was appointed Colonel-Commandant Royal Marines, and Wing-Captain R.N.A.S., and was placed in command of all units of the Flying Services with the Mediterranean Expeditionary Force.



He held this command till the evacuation of Gallipoli in 1916, when he severed his connection with aeronautical affairs. Since leaving the R.N.A.S. General Sykes has been a Deputy Director of Organisation at the War Office, and of late he has been a member of the Supreme War Council at Versailles.

It is said by those who served with him that as an organiser he is altogether excellent. As a commander of men it is said by those who did not agree with him that he was too secretive, and that, by keeping his plans and theories and ideas too much to himself, he failed to arouse that enthusiasm and *esprit de corps* which is so necessary in business of this nature.

Nevertheless, General Sykes has the faculty of inspiring strong personal regard, and of getting a vast amount of good work out of his subordinates. He has an unlimited capacity for hard work, and never expects a subordinate to do more than he does himself. Moreover, he is quick to recognise and acknowledge keenness in others. Therefore one may regard his appointment as likely to maintain to the fullest degree the efficiency of the Air Force in so far as the organising work of the Chief of the Air Staff affects it.

Those who were closely in touch with General Sykes in the early days of the R.F.C. always speak of him as an officer of great foresight, and as possessing that gift of imagination which leads to the forming of new plans in time to forestall the enemy. These, at the present moment, are qualities which may well be of very high value to the Royal Air Force. Those who were concerned with military aeronautics before the war will recall certain lectures and remarks by Major Sykes, as he then was, at meetings of the Aeronautical Society, which displayed his foresight, and one may safely say that if the *matériel* of the R.F.C. had been developed along the lines which he then laid down, the Corps would have been saved many of the losses which it has

suffered during the war, and would have done even better work than it has done. At any rate, he will have the good wishes of all old-timers in his new task.

Of Sir Henry Norman.

The reason for Sir Henry Norman's appointment to the Air Ministry has not yet been disclosed. Nor has the reason for his visit to Germany on wireless affairs before the war been made public. Nevertheless, those in touch with the work of the Air Ministry are disposed to regard him as a distinct acquisition.

As a man of considerable means, he is not likely to be influenced by the desire for personal gain, as are so many politicians. As he inherited his wealth and did not make it himself, one may accept him as one who has come by his money honestly. And, incidentally, he is a gentleman by descent, which is somewhat unusual in political life in these days.

He is known as a man of considerable scientific knowledge, which he has acquired as an amateur and not under the necessity of making a living. Therefore his judgment is not likely to be biased by running in a groove, nor warped by too close an adherence to one side of a subject.

It is said that he has already gained quite a useful knowledge of practical aeronautics, as well as of the internal politics of aviation, so that, despite his short connection with the Air Ministry, he is far better qualified to deal with aeronautical matters than is anyone who has hitherto held a political appointment.

What may be Sir Henry Norman's ultimate goal in the Air Ministry one has not the faintest idea. Being a gentleman of means, and not a self-seeking politician, it is even possible that his goal may be simply the achievement of the highest efficiency and the best possible equipment in the Air Force. In such case he deserves well of the commonwealth.

ON A FIELD THAT SHOULD BE DISPATCHED.

Of the R.A.F. one may say that up to the present its sponsors, promoters, or whatever they like to call themselves, have arrived just so far as the mental point at which Mr. Pemberton-Billing had arrived in 1915, before he left a comfortable job and certain promotion in the R.N.A.S. to fight for a seat in Parliament and political martyrdom. He, at that time, believed in a single Imperial Air Service, under one big, strong man: a Service which would tell off individuals for sea, land, and air operations as requisite, drawing them all from a common pool. For all his war experience, as exemplified by his South African medal with its many bars, and his three mentions in dispatches in South Africa, and his clever organisation and carrying out of the raid on Friedrichshafen, and his consequent recommendation for the D.S.O. and Legion of Honour, and his letters of thanks from the Authorities, Mr. Pemberton-Billing's enthusiasm for flying led him to see the matter too narrowly at first.

Later on, very soon after he entered Parliament, and after many long arguments with people concerned with and for the Services, he came to the same conclusion as that which had always been maintained in this paper, namely, that a sailor is a sailor, and a soldier is a soldier, and that to achieve the highest efficiency the R.N.A.S. should be a part of the Navy, the R.F.C. should be a part of the Army, and that the Imperial Air Force—or R.A.F. if one pleases—should be kept entirely for air operations, such as bombing and air fighting, outside the operations of the Navy and Army.

So far as this common-sense conclusion our High Authorities have not yet attained. They have not even reached the point of splitting the Royal Air Force into three distinct wings, and giving separate existence to the Naval, Military, and Air Force people. At present the Force is a kind of conglommerate Trinity in which the personnel is as hopelessly muddled as it is in the Athanasian Creed.

None the less one is certain that, sooner or later—provided always that the British people are true to their King and themselves, and do not let the politicians sell them to the Germans, either for money or under fear of blackmail—the three Services must separate out, simply because an aeroplane or an airship is merely a vehicle, like a boat, or a motor-car, or a train, which carries a sailor or a soldier or an air-fighter upon his lawful occasions.

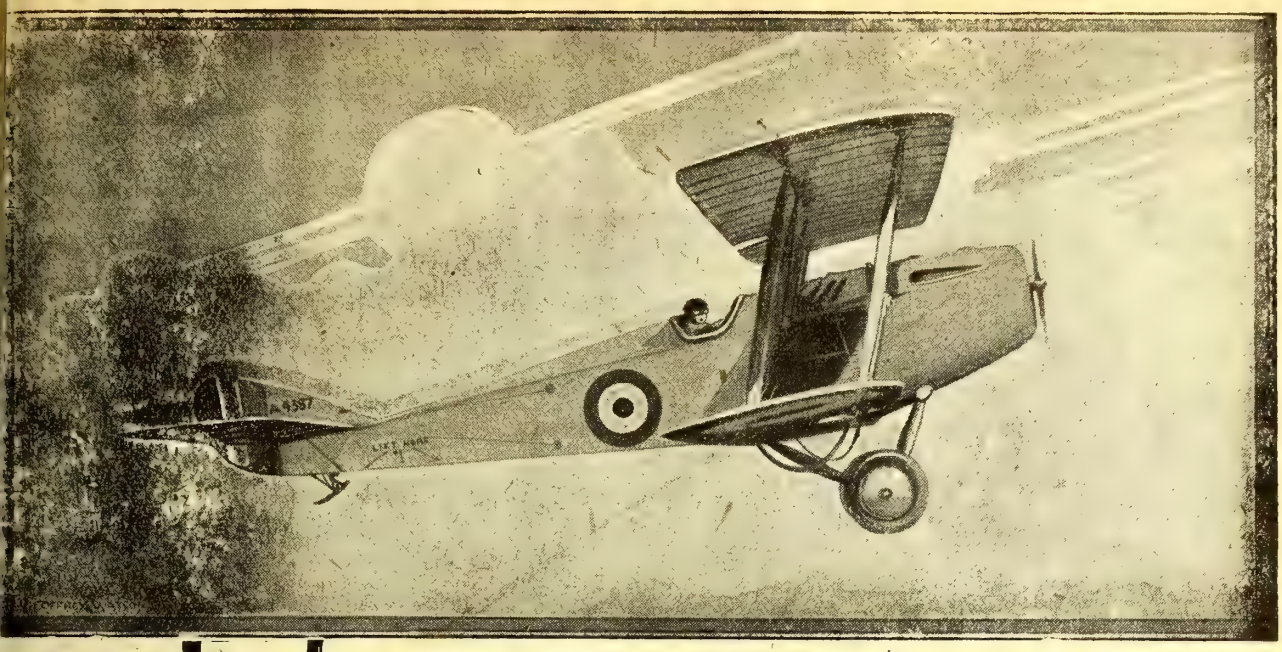
A New R.N.A.S.

It is already freely said that the Admiralty will before long take the R.N.A.S. back to the Navy's bosom, and that if it refuses to come back the Navy will start a new Air Service of its own. The sooner it does so the better, if half one hears is true about the abolition of seaplanes and flying boats because, forsooth, engines are now supposed to be so reliable that land machines can fly safely on sea patrols.

Years before the war this paper consistently pointed out that slightly modified land machines could be catapulted off the decks of ships. In fact, the first aeroplane in this country to alight on water flew off the deck of a ship. Also poor little Pégoud showed how easy it was for an aeroplane to hitch itself onto a wire when returning to a ship. Consequently one may easily obtain wrong ideas about the functions of seaplanes and seaplane carriers.

Therefore it is well to remember that there is not much chance for seaplane-carrying surface-ships when the water is full of submarines and the air is full of torpedo-seaplanes. Nor is there much use even for the ingenious seaplane-carrying submarine which Mr. Pemberton-Billing devised some years ago, when he was merely an aircraft manufacturer and not a social reformer, provided there are a few good, big sea-going flying-boats in the vicinity.

Consequently it becomes more and more obvious, if people will only take the trouble to think, that seaplanes, big and small, are the Navy's job and that no other Service has any business with them.



A New R.F.C. and R.A.F.

Similarly it is obvious that Army reconnaissance, photography, tactical bombing, infantry contact, and artillery observation are jobs for trained soldiers. Ground strafing may be anybody's job. Even seaplanes may take a hand in it at a pinch, as they have done in the Eastern Mediterranean and in Belgium. But the other work is the Army's affair.

Hun-stalking in the higher altitudes, and "dog-fights" in and around the ten and twelve thousand-foot levels, are more or less pure Air Force work, for those skilled air-fighters who are pleased to call themselves, in their grimly humorous way, "hired assassins" need have no military training. The long-range, or strategic, bombers need even less approximation to the manners, customs, and technical education of the Army.

If we are to make our Air Power supreme—as, before the war, we assumed our Sea Power to be supreme—these matters must be handled with intelligence.

"Lingering wars with little cost" cannot be carried on in the air. They were always the most expensive in the end, even on land or sea, as Shakespeare—or Bacon—well knew when he put those bitterly sarcastic words into the mouth of the Messenger from the British

MARTINSYDE

Aerodrome and Auxiliary Works:
BROOKLANDS.

Head Office & Works:
WOKING, Surrey.

Expeditionary Force which, under Lord Talbot, had been defeated in France at the opening of the reign of Henry VI.

He who "thinks without expense at all by guileful words peace may be obtain'd" is the same kind of monumental fool as our own Pacifists, or the Russian revolutionaries who deposed his Imperial Majesty the Tsar. Such an one would merely hand the country over, first of all to Bolshevism, and ultimately to the enemy.

He who "would fly swift, but wanteth wings," is the only one who thinks on the right lines. It is the task of the Air Ministry, and of all of us, to see that those wings are no longer wanting, and shall never be wanting in the future. Thus, and thus only, shall the muttering among the soldiers cease.—C. G. G.

THE NEW CHIEF OF THE AIR STAFF.

The Secretary of the Air Ministry forwarded the following notice to certain newspapers for publication on April 15th:—

His Majesty the King has been pleased to appoint Major-General F. H. Sykes, C.M.G., to be Chief of the Air Staff, Royal Air Force, on the resignation of Major-General Sir Hugh Trenchard, K.C.B., D.S.O.

THE OFFICIAL REASON.

On April 15th, Major J. L. Baird, the Parliamentary Secretary to the Air Ministry, replying to Mr. W. Joynson-Hicks, said that the resignation of Major-General Trenchard resulted from the fact that he took a view as to the powers and duties of the Chief of the Air Staff which the Secretary of State of the Royal Air Force could not accept.

He was authorised by the Secretary of State to say that personally he yielded to nobody in appreciation of Major-General Trenchard's high qualities, and much regretted that a difference of opinion on a point of principle should have arisen.

[The fact that General Trenchard has "made good" under the most adverse circumstances will incline all who have the safety of the Nation at heart to back his opinion against that of any civilian appointed by Mr. George. Sir Hugh's removal is the most fatal thing that can possibly happen, and at this particular time the change is absolutely criminal.

General Trenchard is too straight a man to suffer gladly these politicians, whose aim in life seems to be thinking out ways of losing the war as quickly as possible. Everyone who has anything to do with military aviation knows that General Trenchard is the only man who knows the job and who has the power and driving force to get things done. Both Services know him and trust him implicitly. All the country knows our politicians and distrusts them absolutely.—C. G. G.]

A WAY OUT.

The simplest way out of all the present disastrous squabbling over the affairs of the air seems to be for the Admiralty to revive the Royal Naval Air Service on its own account, and for the Army Council to revive the Royal Flying Corps as a purely military concern.

Officers and men of the R.N.A.S. and of the R.F.C. have, under the Air Force Act, the right to resign from the R.A.F. any time within three months from the first of April. If the Navy and Army act promptly, they can thus secure the pick of the personnel of both the Flying Services for their own separate aerial uses, leaving the rest for the Royal Air Force.

If the Aircraft Production Department of the Ministry of Munitions is so much under the influence of the Air Minister as to refuse to supply the necessary seaplanes to the Navy, and military aeroplanes to the Army, then it would be simple for the Navy to build its own machines in its dockyards, and for the Army to build its machines at Woolwich Arsenal, or at other purely military establishments.—C. G. G.

MORE RESIGNATIONS.

As this paper goes to press it is stated that Sir Godfrey Paine and Sir David Henderson have also resigned from the Air Council as a protest against the removal of Sir Hugh Trenchard, and that they have been allowed to go.

LORD ROTHERMERE'S VIEW.

Lord Rothermere has addressed the following letter to Colonel Faber, M.P. As some of his views are open to argument it has seemed well to insert comments where necessary:—

April 14th, 1918.

Dear Colonel Faber,—Regarding your call upon me last week, and your subsequent letter, I wish to assure you that the subjects we discussed are having my most earnest attention.

It is true that the number of Staff officers in the Home organisation of the Flying Service is nearly as great as the number of active airmen on the fighting fronts. It is deplorable, but I am not responsible for the system which engenders such a multiplicity of Staff appointments.

[The number of Staff appointments at the Air Ministry is due to the inefficiency of the whole Government system. The so-called Staff officers are not officers at all, but merely clerks in uniform. In actual fact the number of *pukka* officers employed on real Staff work is very small.]

A swollen organisation always means inefficient administration, but it is to be said for the present system that hastily improvised arrangements made in war time must always be somewhat cumbrous and will always leave plenty of room for criticism. There is much duplication, and a great many of these most excellent officers are engaged in filling up unnecessary forms and carrying out circumlocutory methods of conducting business.

Of course, the Hotel Cecil does not lend itself to efficient organisation. It is, as you know, a vast building with a multitude of small rooms. Supervision is difficult, and there is necessarily much interchange of correspondence which could be avoided if the Staff were accommodated in a building with a small number of very large rooms. However, I am afraid there is no remedy here, because it is impossible to obtain more serviceable premises.

Above all things, the Air Force needs a real Strategic Staff. Almost every move of the enemy on the front brings into existence some new aerial problem which requires instant examination and consideration. A small Strategic Council is now being formed, the members of which will be selected for their knowledge of aerial warfare and for their capacity to envisage some of the aerial problems which the coming months and years will force to the front.

[Hitherto there has been no need for a Strategic Staff, for the supply of machines has been inadequate for the Army's tactical work, and Naval strategy does not exist. If the Army's needs are now filled, then perhaps it may be possible to think of Air strategy. However, Lord Rothermere's reference to the enemy's moves on the front seems to pertain rather to tactics than to strategy; perhaps he is confusing the meanings of the two words, as so many journalists do. A Strategic Council on air warfare without General Trenchard seems rather like "Hamlet" without the Prince of Denmark, for there is none with so deep and wide a knowledge of the subject.]

I intend that the door shall be thrown wide open for promotion of any and every officer whose merit first from the disciplinary, and then from the flying or technical, point of view, entitles him to advancement. The Regular officer must always receive priority of consideration.

[This, at any rate, is a thoroughly sound rule.]

He is the backbone of the three fighting Services, but after all his claims have been met there should be wide scope for the promotion of Temporary and Special Reserve officers, for in the Air Force these officers comprise more than 90 per cent. of the entire staff. So far not one of them has risen to the rank of Brigadier-General on any of the battle fronts or in the training divisions at home.

[There seems no reason why any of the temporary officers should so have risen. They are all young men without military experience who joined merely as pilots. Many S.R. officers are Lieut.-Colonels, and one at least has been a Brigadier—so that Lord Rothermere is wrong in his facts. And a Territorial officer has done excellent Staff work as a Brigadier. In fact promotion in the R.F.C. has been very just, and as a rule very successful. One only hopes that some of the queer new appointments in the R.A.F. will prove to have been half as well judged.]

In regard to Staff appointments, I think that in the hurry of getting things done not sufficient consideration was paid, when selections were being made to the Home Staff, to the claims of wounded and incapacitated airmen. In future, when an appointment is to be made, war service will count first.

[One hopes that the claims of "incapacitated airmen" will not receive undue consideration. If a man is suffering from the effects of a wound or a crash, especially if his nerve is affected, he is the last man in the world to be fit for the mental strain and constant worry of Staff work. An office full of invalids does thoroughly bad work or none at all. It has been tried, and it has been found to be the worst form of false economy. It is cheaper and kinder to pay these officers to keep away from the office, except in the cases of trained Staff Officers.]

There is the other matter we discussed, which is of urgent importance, but which I would rather not further refer to in my letter. I recognise its gravity, and am taking immediate measures. It is a matter which, fortunately, concerns the Home organisation, and is therefore capable of direct handling. It has caused me a great deal of anxiety, and I am fully aware of my profound responsibility. I have received many letters on the subject.

You may be disappointed with my letter. War, however, is not the time to make charges, and for my part, whatever counsels are urged upon me, I cannot—as in the past, so in the future—act except after the most deliberate consideration, and then only with the most meticulous care.

Yours faithfully, ROTHERMERE.

ANOTHER AIR MINISTRY APPOINTMENT.

The Secretary of State for the Royal Air Force has appointed Brigadier-General Guy Livingston, C.M.G., to be Air Secretary to the Secretary of State, combining the duties with those of his appointment as Deputy-Master General of Personnel in the Air Ministry.

MORE AIR FORCE APPOINTMENTS.

A writer in the "Evening News" of April 15th says:—

"I hear that Maj.-Gen. F. C. Heath-Caldwell, C.B., is appointed for the flying command in the London district; Maj.-Gen. the Hon. Sir Frederick Gordon, K.C.B., D.S.O., to the York district; Maj.-Gen. M. E. F. Kerr, C.B., M.V.O., to the Salisbury district; Brig.-Gen. J. F. A. Higgins, D.S.O., to the Birmingham district; and Maj.-Gen. G. C. Caley, C.B., to the Glasgow district.

"Maj.-Gen. Heath-Caldwell was born in 1858, entered the Royal Engineers in 1877, and serveed in Egypt, the Soudan, and South Africa.

"Maj.-Gen. the Hon. Sir Frederick Gordon is the fourth son of the late Lord Gordon. He was born in 1861, and was in the battles of Tel-el-Kebir, El Teb, Tamai, and in the South African campaign. He has already been mentioned five times in this war.

"Maj.-Gen. Kerr served in the Egyptian and Soudan campaigns. He has the Royal Humane Society's medal for saving life at sea. He holds many honours from European Sovereigns. He took the flying certificate of the Royal Aero Club in July, 1914. He has published books and essays on Nelson, also on flying."

[Gen. Kerr is better known as Rear-Admiral Mark Kerr, R.N., and Gen. Caley as Commander Caley, R.N. As this information appears in the Harmsworth Press it is probably "straight from the horse's mouth," and it has probably been passed by the Censor. Otherwise one would hesitate to make public information which has not been published officially.—Ed.]

AN OFFICIAL EXPLANATION.

It was announced by the Press Bureau on April 15th that, owing to the peculiar circumstances in which the Royal Air Force has been formed while active operations are in progress, the number of senior officers in the Force has been found insufficient to provide for the administration and command of the large forces at home which have been transferred from the Navy and Army. Certain officers of high rank have therefore been temporarily lent to the Air Force by the Admiralty and Army Council to carry out these duties.

[This is precisely the kind of explanation which it was suggested in THE AEROPLANE of April 10th ought to be sent out to allay ill-feeling in the R.A.F.—Ed.]

A PRODUCTION APPOINTMENT.

Mr. Alan E. L. Chorlton, C.B.E., has been appointed Assistant Controller of the Department of Aircraft Production, to deal with the supply and production of aero engines, excluding Rolls-Royce engines.

Alan Ernest Leofric Chorlton, C.B.E., M.Inst.C.E., M.I.Mech.E., M.I.E.E., is also a Member of the Institute of Automobile Engineers, an Associate Fellow of the Aeronautical Society, a Member of the American Society of Mechanical Engineers, a Member of the Board of Inventions and Research, a Member of the Financial Committee of the Ministry of Reconstruction, a Member of the Civil Aerial Transport Committee, a Member of the Agricultural Engineering Sub-Committee of the Royal Society, and a Member of the Technical Committee of the Motor Industries.

He has been released by Ruston Proctor & Co., Ltd., of Lincoln, to join the Air Board. For some time past he had occupied the chief engineering post with that firm, where he organised a remarkable output of engines and aeroplanes combined.

For many years he has been closely associated with internal combustion engines, in connection with which he has produced many inventions, more particularly referring to large gas and heavy-oil engines, on which subjects he is a recognised authority of substantial reputation. He has contributed many papers to various institutions on internal combustion engines and pumps, particularly turbine pumps, as well as on works management and agricultural oil tractors.

He has on several occasions given evidence before Royal Commissions on engineering matters. He has lived and travelled in Russia, and has visited engine works in Germany for fifteen years, up to the outbreak of war, with a view of keeping up to date in connection with internal combustion engine matters. Therefore, one is justified in expecting great things from his advent to the Aircraft Production Department.

AIR FORCE PROCEDURE.

A regulation made by the Air Council states that in the case of an officer transferred from the naval or military forces to the Air Force the time during which he has held a commission in the force from which he is transferred shall, for the purpose of qualifying such an officer as president or member of a court martial, be aggregated with the time during which he has held a commission in the Air Force

* * *

An order is gazetted authorising general and field officers of the Royal Air Force to issue billeting requisitions.

AIR FORCE RANKS.

Various second lieutenants of the R.F.C. who apparently have not seen or at any rate have not read Air Force Memorandum No. 1 seem to be in doubt as to their rank in the Air Force. It is perfectly clear from appendices 1b and 1c that flying officers second lieutenant or lieutenant and flying officer observers second lieutenant or lieutenant come into the Air Force as lieutenant at 12s. a day, with 1s. a day additional for each completed year's service. When entitled to draw flying pay they do so at the rate of 8s. per day.

AIRCRAFT IN THE HOUSE.

On April 9th **Mr. Lloyd George**, in the course of his speech on the recent retreat in France, made the following references concerning aircraft:—

Owing to the growth of the strength of our Armies in 1917, when this battle began the combatant strength of the whole of the German Army on the Western front was only, approximately, though not quite, equal to the total combatant strength of the Allies. In infantry they were slightly inferior, in artillery they were inferior, in cavalry they were considerably inferior, and, what is very important, they were undoubtedly inferior in aircraft.

The Germans had, however, one or two important advantages. The first, the initial, advantage, which is always commanded by the offensive, is that they know where they mean to attack—they choose the ground, they choose the location, they know the width of the attack, they know the dimensions of the attack, they know the time of the attack, and they know the method of the attack. All that invariably gives an initial advantage to an offensive. The defence has a general advantage. Owing to air observation concealment is difficult. At the same time, in spite of all that, owing to the power of moving troops at night, which the Germans exercised to a very large extent, there is a large margin for surprise even in spite of air observation, and of this the enemy took full advantage.

Our aircraft strength is greater now than before the battle, and we all know what brilliant service our airmen have rendered in this battle. (Cheers.) Until the whole story of the battle is told it would be almost impossible for us to estimate the services they have rendered in retarding the advance of the enemy, in destroying his machinery, and in making it difficult for him to bring up his guns and ammunition. We feel confident that our armies, generals, and soldiers will be quite equal to the next encounter whenever it comes.

COMPARATIVE OUTPUTS.

Mr. F. Kellaway, Parliamentary Secretary to the Ministry of Munitions, outlined the progress made in the production of munitions in an address to the Bedford Women's Liberal Association on April 11th.

The increase for the first two months of the year compared with the first two months of 1917 was as follows: aeroplanes, 223 per cent.; aero-engines, 245 per cent.

The average weekly production of aeroplanes for this year equalled the average production for two months in 1915.

[Provided that Mr. Kellaway has not been doped with faked figures the results seem quite satisfactory.—Ed.]

SAUNDERS OF COWES

FOR nearly 90 years the firm of SAUNDERS has been established on the Thames and at Cowes, Isle of Wight. They have long been known as constructors of fast power boats, and are holders of all the world's records for speed.

¶ They are also pioneers in the design and construction of the *first successful Flying Boats in this Country*, which were taken over by the Navy *two years before the War*.

AIR FORCE MEMORANDUM NO. 4.

INITIAL ARRANGEMENTS WITH AIR FORCE AGENTS FOR THE ISSUE OF PAY AND ALLOWANCES OF OFFICERS, AND FOR THE TRANSFER FROM ADVANCE PAYMENT TO PAYMENT IN ARREAR.

NOTE.—These notes are issued in amplification of the information already given in the Air Force Memorandum No. 1. They relate to the transition only. The standing procedure for the issue of pay and allowances of Officers of the Royal Air Force is given in F.S. Publication No. 5.

1. On the formation of the Air Force the pay of all officers will be issued monthly in arrear. The change from payment in advance in the case of officers at present serving with the Army will take effect from the outset, and the first monthly issue of pay will accordingly be made to *all* officers on the last day of the month in which the transfer takes place.

2. Following the general practice of the Army, payment will in all cases be made through duly appointed Air Force agents, as follows :—

(*a*) Staff, Flying and Observer Officers,
through Messrs, Cox and Co.,
109-111, St. Martin's Lane,
London, W.C.2.*

(*b*) Technical and Administrative Officers,
through Messrs. Holt and Co.,
3, Whitehall Place,
London, S.W.1.

These agents will be authorised to credit each officer at the end of each month with the amount of pay due, including flying pay, and technical pay. The agents through whom an officer receives his pay will—

(*a*) Accept his instructions as to how the amount is to be dealt with, and

(*b*) Be prepared to carry out the functions of banker and agent for the officer, if so desired.

3. It will be clearly understood that Air Force officers are perfectly free to keep their banking accounts with any banker they may select, and it will be open to them to instruct the agents to remit their credits regularly to any other banker, if they so prefer. All officers whose agents are now changed (paragraph 2), or for whom an agent is now being appointed for the first time, must instruct their agents at once as to this, and commanding officers of all units of the existing Flying Services should take immediate steps to see that this is done. The agents are themselves addressing a circular on the subject to all officers concerned. In the case of units in the United Kingdom, instructions should reach the agents on or before March 31st, if possible. (No action under this paragraph is necessary on the part of officers of the R.F.C., whose pay is, *and will continue to be*, issued by Messrs. Cox and Co., under paragraph 2 above.)

4. In order to meet any inconvenience which may be caused to an officer transferring from advance payment to payment in arrear, the agents have been instructed to make an advance (after the date of transfer) to any such officer, at his request, up to the extent of one month's pay. This advance will be made free of interest, and will be recoverable within six months; as a general rule officers may find it desirable to arrange to refund the advance by monthly abatements from pay.

Certain officers who will be entitled in ordinary course to a gratuity payable on discharge, under the existing pay regulations for the Army, may have the amount of the advance charged against the final gratuity if they signify to the agents that this is their desire, and in these cases no recovery of the advance will be required.

Requests for an advance under this paragraph should be made to the appropriate agent at once.

Officers transferred from the Royal Naval Air Service are not affected by this paragraph.

5. In cases where increased rates of pay will be due on transfer to the Air Force, these rates will, as far as possible, be issued from the commencement. In some cases, however, the full increase cannot be given pending individual assessment; *e.g.*, in the case of technical officers (especially of those coming from the Navy), the service pay of the rank will be given plus the minimum rate of technical pay, 2s., unless the existing pay of the officer is already higher.

6. The normal rule for Royal Air Force Officers serving in H.M. ships will be that they may receive payment from the R.N. paymaster in return for cheques drawn on their agents or

* Special note should be taken of the new premises which Messrs. Cox and Co. have opened for the Air Force.

An official photograph of a British fighting pilot and his armament. The Lewis Gun on top may be seen connected with the telescope-sight below. The curious-looking rings on the upper plane are merely the usual aileron levers of the Nieuport biplanes, and are not some new form of frightfulness. The tube which operates these levers is seen in front of the ∧ -shaped centre struts, and at this angle look like a strut to the muzzle of the Lewis Gun.

ROLLS-ROYCE

Supremacy in the Air

Rolls-Royce Aero Engines like Rolls-Royce Cars are the Best in the World

"It is no flattery to state that whatever our superiority in the air may be, it is largely owing to the good fortune which led the authorities to select Rolls-Royce Engines for the most important aircraft." *"The Liverpool Courier," March 14, 1918.*

ROLLS-ROYCE, LTD., *Contractors to H.M. Government,*

AND AT DERBY, PARIS, NEW YORK, MADRID, BOMBAY, ETC

ROLLS-ROYCE

bankers up to certain limits. Similarly, officers serving with an expeditionary force may draw pay from field cashiers in return for cheques on the agents under the conditions laid down by the War Office for Army officers. As it will not be possible for such officers at the more distant stations to instruct their agents as in paragraphs 3 and 4 for some short time after the creation of the Air Force, the transition procedure in their case will be as follows :—

All officers whose agents are changed, or for whom an agent is now being appointed for the first time, will instruct their new agent as in paragraph 3, as early as practicable. They will meantime obtain any necessary cash locally in the manner just stated.

As regards the advance referred to in paragraph 4, the agents will be instructed to assume in such cases that the advance is desired, until the officer's wishes are known. Officers transferred from the Royal Navy who, subsequent to the date of transfer, may have received from a Naval paymaster advances on account of their pay according to Navy practice, should liquidate these advances in due course by giving the paymaster a cheque drawn on their agent or banker.

7. Children's allowance to officers eligible for the allowance will be credited through the Air Force agents concurrently with (and in the same manner as) pay, and will be dealt with in accordance with the officer's instructions to the agents.

All other allowances will be claimed through the Commanding Officer of the unit to which the officer belongs, in accordance with the instructions referred to in the prefatory note to this leaflet. These allowances, when passed for payment, will be issued through the agents in the same way as pay.

8. Any claims for allowances which may be outstanding in respect of service prior to the date of transfer should, however, be forwarded to the usual Admiralty or War Office paying officer, and as far as possible should be rendered before the formation of the Air Force.

Air Ministry, March 21st, 1918.

R.N.V.R. OFFICERS' PAY AND ALLOWANCES.

Among the various little matters which still remain to be adjusted so that officers of both Services may come into the R.A.F. under absolutely fair conditions the question of pay and special allowances to R.N.V.R. officers demands attention.

A lieutenant, R.N.V.R., receives approximately £275 per annum which is rather less than one would pay to a first-class mechanic in a workshop in these days, and is, of course, only about half what a really clever piece-worker can earn in many of the heavy engineering trades.

When the R.N.V.R. lieutenant attains to the proud dignity of Lieut.-Commander, and ships his extra half stripe, he receives no more pay, and his special allowance of something like £2 per month for each of his children is reduced by half, apparently on the theory that in order to uphold the proud position of a two-and-a-half-striper R.N.V.R. a man must be an independent gentleman of considerable means, who therefore does not require what is commonly known as "kid allowance."

The assumption that all R.N.V.R. officers are well-to-do is confirmed by the fact that the kit allowance for an R.N.V.R. officer on joining is £15, which of course just about pays for his boots and overcoats.

Now when these officers turn over to the R.A.F. they will have to obtain a complete new kit, even down to their boots and socks. Apparently the only articles of their clothing which will be wearable in the R.A.F. will be their underclothes and ties.

It is true that they are supposed to be allowed to wear out existing uniforms, but this is in fact not very helpful because an officer naturally renews his uniform as required, piece by piece, buying perhaps a new overcoat at one time, or a new jacket at another, whereas in the case of all the officers dressed in blue when once they have to get into khaki they will have to buy everything new at the same time, which on the very lowest estimate will entail the outlay of about £40. It will be interesting to know how the Authorities expect a man to lay out £40 or £50 in a new kit, maintain himself as befits an officer and gentleman on the balance of his £275, possibly having to support a wife and family at the same time, and still remain honest.

The case of the R.F.C. Equipment Officer, 1st Class, who is doing the same job as the two striper R.N.V.R. is very different. In the first place, his pay is about £450 per annum. In the second place, on joining, he was given a kit allowance of something between £35 and £50, and when he ultimately has to change his Army uniform for the costume of the R.A.F. he will have to buy comparatively few new things. His Field Service jacket may be altered into an R.A.F. tunic; he has to buy a new cap, poor wretch, but all his other clothing, boots, puttees, breeches, overcoats, shirts, collars, etc., remain the same, with the exception of his ties.

This means that the officer in blue who has been very much worse paid for doing exactly the same work and has originally been given a very much smaller kit allowance, and who after two or three years' Service is obviously several hundred pounds worse off than the R.F.C. Equipment Officer, is put to a very much greater expense in changing over. It seems therefore that purely as a matter of fair play the High Authorities should make some special allowance to R.N.V.R. officers who are taken over by the Air Force.

One knows of cases in which the work of one R.N.V.R. two striper or two-and-a-half striper would in the R.F.C. be divided up between at least three First-Class Equipment Officers, and there are even cases in which an R.N.V.R. two-and-a-half striper, on his 15s. a day or so, is dealing with contracts running into many hundreds of thousands of pounds per annum, while his actual subordinates, being technical officers, draw pay at the rate of several hundreds of pounds per annum more.

There are cases in which gentlemen have given up jobs worth £1,000 a year or more, on what would by now be profitable Government contracts, in order to take this paltry R.N.V.R. stipend and serve their country. It is equally true that the R.N.V.R. uniform in the case of some of those who are now officers of the R.A.F. covers gross instances of trench-dodging.

One therefore suggests that it would be very much for the good of the R.A.F. if those in high places were to investigate the circumstances under which all R.N.V.R. officers joined the Air Force in the first place, and if they were then to arrange for special pay and allowances in some sort of relation to their individual capabilities rather than according to their rank.

Such distinctions are made in the Army by having special allowances for Staff pay and so forth, and there is no reason why it should not also be done in the Air Force.

THE ROYAL AIR FORCE.

The Royal Air Force is now *in esse*, but is it too late therefore to correct some injustices which are made manifest by the publication of details of its organisation?

These are chiefly concerned with the proposed treatment of the R.N.A.S., which, for some reason or other, always appears to be treated as the Cinderella of the fighting forces. The new regulations, as they affect this very efficient body, have already caused considerable heartburnings among the personnel, and it would be well, before real harm is done, and disaffection aroused, to consider if it is worth while to let the Royal Air Force start its career free from any suspicion of jealousy or discontent in any section of its constituents.

On the surface it may appear that the R.N.A.S. is equally fairly treated with the R.F.C., but on examination the fallacy of this view is apparent. In the R.F.C. promotion has always been very frequent and free, and it is still going gaily on, but in the R.N.A.S. the scheme of promotion has occasioned brain storms among those who have tried to understand it. It is irregular, tardy, and, curiously, seems to favour pukka R.N. officers, men on home stations and those on the staff.

Then, to crown all, though the R.N.A.S. has carried on gallantly, being responsible for much good work, promotion practically came to a full stop at the beginning of this year.

Decorations continue to be given, but when such grounds as the following are given for the bestowal of a D.S.C.—"He has been eager and ready to go up at all times, and has shown no thought of personal danger" (of what man on war service could this not be said?), many good men are congratulating themselves on escaping such marks of distinction.

It is this condition of things which is at the root of the injustice which will be done to the R.N.A.S. if there is not some revision of the scheme of grading in the Royal Air Force.

Flight lieutenants and observer lieutenants who have worked keenly and gallantly on war service stations for two or more years (deserving promotion as much as any other officers with as much or less service, for every flying officer who has survived a year of war service may be reckoned, given equal opportunities, as good as any other officer) will be lumped with flight subs., observer subs., and warrant officers 1st class, in the rank of lieutenant, to take their chance then of a step to a higher rank in the "promotion by selection" scheme which is a feature of the Royal Air Force.

"Promotion by selection" is an excellent system, if selection is made on merit only, but it cannot be given a fair start in the Royal Air Force unless officers of the R.N.A.S. are at once put on an equal footing with officers of the R.F.C., in the matter of rank earned (if not gazetted) by war service.

An adequate way of dealing with the situation would be to grade as captains in the Royal Air Force all flight lieutenants and observer lieutenants, R.N., who have been in the R.N.A.S. since 1915, and who have been on war service for eighteen months. Their survival of war service for this period would be a perfect test of their capacity for the higher rank.

When lieutenants R.N.V.R. and assistant paymasters are to be graded as captains in the R.A.F. there seems to be no reason why the men who have fought so gallantly to establish our supremacy in the air should not be rewarded with at least similar rank.—M. F.

Pilot's Wonderful Escape Thanks to "TRIPLEX" SAFETY GLASS

Another Striking Example of "Triplex" Trustworthiness :-

DEAR SIRS,

.....While flying an Avro I crashed into a wireless car fitted with windows composed of your glass, hitting the car with such force as to completely smash in the whole of one side.

The sheet of glass was quite intact, but while being passed from hand to hand a few pieces were rubbed off.

The windscreen was also badly shattered but also held together in the same remarkable manner as the sheet of glass.

My goggles—also Triplex—were cracked all over and undoubtedly saved my eyes, since my face struck the forward edge of the cockpit with such force that it gashed my nose, necessitating seven stitches.

Yours, etc.,
XXXXXX XXXXX,
R.N.A.S.

Use "TRIPLEX" exclusively for GOGGLES, WINDSCREENS, WINDOWS OBSERVATION PANELS, Etc., Etc.

THE ROYAL VISIT.

The Special Correspondent of the "Times" writing in an East Midland County on April 11th, says:—

"The King and Queen arrived by the Royal train this morning at a little country station a few miles away from a great aerodrome where Prince Albert is serving as a captain in the Royal Air Force. The young Prince, who was on the platform to receive his parents, exchanged affectionate and homely greetings with them. He kissed the Queen's hand and then her cheeks and was asked to explain his new uniform.

"The visit to the aerodrome was the first the King has paid to the newly-constituted Air Force. When the Royal party reached the parade ground they found one section of the men drawn up for inspection, wearing the uniform of the Flying Corps, and another section in the uniform of the Naval Air Service. The rank and file have yet to merge their old identity in the tunic of the new organisation. But the King came to them as the General-in-Chief of the combined and united third branch of his armed forces. Prince Albert took his place as the officer in command of the Naval Boys, and the King, attended by Brigadier-General Briggs and Lieutenant-Colonel Talbot, walked round the ranks.

"The place is a wonderful centre of activity and inspires the fullest confidence in the efficiency and equipment of British aviators. The King and Queen, in the course of an hour, saw machines and buildings and apparatus which three years ago had not come within the vision of Englishmen. Special attention was given to a Handley Page machine which rested on the green slope of an extensive plain. The King, after donning a white coat, climbed into the pilot's seat and had explained to him the control and other mechanism. The Queen, too, showed great interest in the details of the aeroplanes, and afterwards they spoke to several American officers.

"The change over from Naval ratings to the formation of the Royal Air Force is not being accomplished without many slips of tongue and action. The whole language of the aerodrome has to be forgotten, and a new one learned. A mess deck is now a dining hall, and every convention of land service on a sea basis is scrapped. Some of the men are not yet quite happy about the downfall of tradition, but they appear proud, nevertheless, of the distinctive recognition which has at last been given to their work."

[It is interesting to learn that R.N.A.S. ratings are not in love with the change to the R.A.F. The censoring of the name of the aerodrome is merely silly. The Court Circular has mentioned the station to which Prince Albert is attached. The Royal Aero's Club lists of pilots' certificates mentions it over and over again. The Huns have made various futile attempts to bomb it. The whole description of the activities there points to one place, so why need the Censor make himself look more ridiculous than his Maker made him?—Ed.]

THE EYESIGHT OF PILOTS.

Sir,—Perfect vision means, not only perfect acuity of vision, but the proper co-ordination of the images from the two eyes in the brain, or on their passage thereto; that is, not whether a man is short-sighted or astigmatic only, but whether he has, or has not, in addition to satisfactory acuity, the power of invariably fusing the two images under all, and every condition of stress, this is stereoscopic vision.

Two eyes, working together equally, are necessary in order to judge distance, perspective, etc., promptly; if a man loses one eye, it takes him some time to learn how to pick up a tumbler, or to put one down near the edge of a table, without missing the edge, and dropping the tumbler on the floor; or to place a cup in a saucer, or pour a fluid from one vessel into another, etc.

Defective stereoscopic vision, or the impairment of the power of fusion, is considered generally to be the cause of most squints in children; in mild cases squints are said to be latent, and are not noticeable, except when the children are tired, or nervous, or ill, and many persist throughout life in this form; a latent squint is corrected under conditions by the person affected, keeping up, involuntarily, some automatic will-power over the muscles moving the eyes; and it is quite conceivable, as a result of the tension during flying being suddenly removed, that these muscles are no longer under control, and the images of the two eyes are not fused for the time being, one eye only being used, so the sense of judging distance is lost, hence the reason why some men are found constantly to crash on landing, and may account for certain collisions in the air.

There is another matter dealing with vision, other than acuity, which affects a pilot; a man with a short-focus (not short-sighted) eye, frequently has excellent distant vision, but finds difficulty in seeing very small print in a bad light, this man is constantly having to over-use his focussing muscles; under normal circumstances he can do this without ill effects, but under any sudden stress, for instance, rapid descent, and landing with a fast machine, the muscles will fail to act properly, the vision deteriorate without warning, and a crash results.

Further, vision cannot be considered perfect if there is any defect in the recognition of colours.

(Signed) "Oculos."

THE WOMEN'S ROYAL AIR FORCE.

Arrangements are now sufficiently advanced for recruiting for the Women's Royal Air Force, known as the "Penguins," to begin this week. A considerable number of women are already engaged on work at air stations. Some of these, hitherto employed by the Royal Naval Air Service, are members of the Women's Royal Naval Service, others attached to the Royal Flying Corps belong to the Women's Army Auxiliary Corps. Members of the Women's Legion of Motor Drivers have also been doing duty at air stations. These women will be invited to transfer to the "Penguins" under practically the same terms and conditions as those under which they have served in the organisations in which they are now enrolled. Those who do not wish to transfer will remain in their own corps and will be re-posted to branches of the Navy or Army.

The recruitment of "immobile" members (that is to say, women liable for service in their own locality only) will be proceeded with first. "Immobile" members will live in their own homes, and will receive an allowance in lieu of food and lodging in addition to the fixed rate of pay. "Mobile" members, on the other hand, must be prepared to go to (a) any part of the United Kingdom; or (b) any part of the United Kingdom or oversea, according to the terms of their enrolment, and will be boarded and lodged in Royal Air Force quarters. Further particulars regarding "mobile" members will be issued in due course.

The Women's Royal Air Force will consist of officers, subordinate officers, and members. Every class of women is appealed to except those already engaged on national work. All questions of welfare, discipline, leave, medical services, discharges on grounds of urgency or compassion, and promotions will be controlled by women officers. The selection of senior women officers is being proceeded with, and appointments, when made, will be notified in the "London Gazette." The selection of women as junior officers will be made, as far as possible, from "the ranks." All grades will have an equal chance of promotion, and all will be on the same footing as regards length of service, namely, one year or the duration of the war, whichever may be the greater period. All will be called on to pass a medical examination, and to furnish satisfactory references. No women will be considered for home service under the age of 18, or for service oversea under the age of 20. Applicants must be prepared to undergo a limited period of training if required.

The main categories of employment are four—clerical, household, technical, and general. There is room for every variety of clerk, and the need is specially felt in London, and at Stamford, Birmingham, Lincoln, Oxford, York, Grantham, Salisbury, and Glasgow. The domestic section comprises cooks, waitresses, laundresses, and general domestic workers, and for these there will be a steady demand for the messes of Air Force officers and men and for those of the "Penguins'" quarters. The technical section offers great variety of employment, ranging from motor driving and motor cycling to different branches of aeroplane repair. Photographers, tracers, colourists, fabric workers, metal workers, fitters and aeroplane riggers can all be usefully employed. The general section includes storehouse women, tailors, shoemakers, and others.

Full particulars regarding rates of pay and conditions of service and method of application for "immobile" members may be obtained from any Employment Exchange on or after next Friday. No women for the "mobile" branch will be enrolled at present. Candidates for posts as officers should apply to the W.R.A.F. Inquiry Office, 9-13, Wellington-street, Strand, W.C., which will be open on Friday, or to the Professional Women's Register, Ministry of Labour, Employment Department, 28, Broadway, Westminster.

MUSIC HATH CHARMS.

If any reader of The Aeroplane happens to have a really first class gramophone which can be spared, it would be an act of kindness to present it to the R.F.C. Central Hospital at Hampstead. One does not suggest that a machine of the usual squeak and crash type should be donated—that is to say, one of the kind which Mr. O. Henry described as "Giving an imitation of Sousa's band excavating a march from a tin mine." The kind which would really be acceptable would be one of those nice, soft-toned instruments such as may be purchased by any munition profiteer for a matter of £30 or £40.

Many of the wounded officers are sufficiently strong to be able to move about in the hospital, but cannot get about to theatres and concerts, and therefore would be glad of a little decent music from time to time. Here certainly is an opportunity for some well-to-do aircraft manufacturer to recognise his indebtedness to the people who have assisted him in his success.

NAVAL and MILITARY · AERONAUTICS ·

FROM THE "LONDON GAZETTE."

War Office, April 6th.

With reference to an award conferred as announced in the "London Gazette" dated November 26th, 1917, the following is the statement of service for which the decoration was conferred :—

The Military Cross.

Sec. Lt. (temp. Capt.) Frederick Sowrey, D.S.O., R. Fus. and R.F.C.

For conspicuous gallantry and devotion to duty in shooting down in less than two months two Albatros scouts and a Rumpler two-seater and a Fokker scout, and in two engagements flying very low and engaging and scattering hostile infantry.

War Office, April 9th.

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing.—Wing Comdr.—Maj. (temp. Lt.-Col.) J. A. Chamier, D.S.O., Punjabis, Ind. Army, a Comdt. (graded as a Wing Comdr.), Arty. and Inf. Co-operation School, and to retain his temp. rank while so empld., March 1st, seny. from April 29th, 1917.

Flt. Comdrs.—From Flying Officers, and to be temp. Capts. while so empld. :—Temp. Sec. Lt. D. M. McGoun, Gen. List, March 8th; Lt. F. G. C. Weare, E. Kent R., March 11th; emp. Sec. Lt. I. D. R. McDonald, Gen. List, March 15th; Lt. W. L. Wells, Middx. R., T.F., March 19th; Capt. (temp. Maj.) R. A. Archer, M.C., R.A., reverts from a Sqdn. Comdr., and relinquishes his temp. rank, March 16th, seny. from March 1st, 1916.

Adjt.—Temp. Lt. A. W. Brittain, Notts and Derby R., to be transfd. to R.F.C., Gen. List, and to be temp. Capt. (without the pay and allowances of that rank) whilst so empld., March 3rd.

Schools of Instrn.—School of Technical Training.—Co. Comdr.—(Graded as an Equipt. Officer, 2nd Cl.)—Temp. Lt. T. C. Martin, R. Fus., to be transfd. to R.F.C., Gen. List, and to be temp. Capt. (without the pay or allowances of that rank) whilst so empld., Dec. 11th, 1917.

Memorandum.—Temp. Capt. to be temp. Lt., Gen. List, for service with Ind. Army (on prob.) :—B. White, from R.F.C., Dec. 21st, 1917.

Air Ministry, April 9th.

R.A.F.—The following appointments are made at the Air Ministry :—

S.O., 1st Cl.—Capt. (temp. Maj.) A. B. Winch, and to be temp. Lt.-Col. whilst so empld., April 3rd

S.O., 2nd Cl.—The rank of Capt. L. W. W. Lees is as now stated, and not as in the "Gazette" of April 2nd.

S.O., 3rd Cl.—The initials of Capt. P. N. Logan are as now stated, and not as in the "Gazette" of April 2nd.

S.O., 4th Cl.—The surname of Sec. Lt. (temp. Lt.) G. F. Allison is as now stated, and not as in the "Gazette" of April 2nd.

Memoranda.—C. B. Heald (temp. Maj., R.A.M.C.) is granted a temp. commission as Lt.-Col, April 1st.

Capt. F. G. Wilson to be temp. Maj., without the pay and allowances of that rank, whilst specially empld., April 10th.

Temp. Sec. Lt. (on prob.) R. Wilde to relinquish his commn. on account of ill-health, April 10th.

War Office, April 10th.

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing—Sqdn. Comdr.—Temp. Capt. A. J. Evans, M.C., Gen. List, from a Flt. Comdr., and to be temp. Maj. while so empld. (Feb. 13th).

Flt. Comdrs., from Flying Officers, and to be temp. Capts. while so empld.—Lt. D. V. D. Marshall, A.S.C., T.F. (Feb. 1st); Temp. Lt. J. E. Addinsell, Gen. List; Temp. Sec. Lt. F. Hyde, Gen. List; Temp. Capt. L. V. A. Royle, M.C., Gen. List (March 16th); Capt. B. Weil, A.S.C., Spec. Res.; Temp. Lt. R. A. Preston, Gen. List, and to be temp. Capt. while so empld.; Temp. Capt. O. Horsley, M.C., Gord. Highrs. (March 17th). And to be temp. Capts. while so empld. :—Lt. E. D. Hall, Northd. Fus., T.F.; Temp. Sec. Lt. R. D. Starley, M.C., Gen. List; Temp. Sec. Lt. O. E. Carter, Gen. List (March 23rd).

Adjt.—Temp. Lt. (temp. Capt.) J. H. Jackson, Gen. List, ceases to hold his appt., March 6th.

Schools of Instrn.—Schools of Mil. Aeronautics.—Asst. Instr.—(Graded as an Equipt. Officer, 3rd Cl.)—Lt. H. E. Haslehurst, Lpool. R., a Flying Officer (March 18th).

School of Technical Training.—Asst. Instr.—(Graded as an Equipt Officer, 2nd Cl.).—Temp. Lt. H. E. Hotchin, Gen. List from Officer in charge of Stores (graded as Equipt. Officer, 2nd Cl.), Oct. 12th, 1917.

Gen. List.—Temp. Capt. F. A. Forde, Gen. List, relinquishes the rank of temp. Lt.-Col. on ceasing to hold the appt. of Comdt. Off. Technical Training Corps (March 11th).

War Office, April 11th.

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing—Sqdn. Comdr.—Lt. (temp. Capt.) C. A. Ridley, D.S.O., M.C., R. Fus., from a Flight Comdr., and to be temp. Maj. while so empld., March 19th.

Gen. List.—To be temp. Sec. Lt. :—1st Cl. Air Mech. C. M. Martin, from R.F.C., Jan. 5th.

* * *

The King has been pleased to approve of the following rewards for distinguished services in the Field in connection with Military Operations, culminating in the capture of Jerusalem. Dated January 1st, 1918 :—

The Military Cross.

Lt. (temp. Maj.) V. A. Beaufort, Devon. R. and R.F.C.
Temp. Capt. G. R. A. Deacon, R.F.C.
Temp. Sec. Lt. A. Hopkins, B.W.I. Regt., and R.F.C.
Temp. Lt. J. Kirk, R. Highrs. and R.F.C.
Temp. Lt. D. R. Mackie, R.E. and R.F.C.
Sec. Lt. H. L. C. McConnell, Ind. A. R. of O. and R.F.C.
Temp. Sec. Lt. J. H. Maingot, B.W.I. Regt. and R.F.C.
Capt. I. P. H. Preston, Gen. List and R.F.C.
Lt. A. H. St. Clair, Arg. and Suthd. Highrs. and R.F.C.
Capt. T. G. Thornton, York R. and R.F.C.
Capt. F. E. Williams, Welsh Regt. and R.F.C.
Lt. (temp. Capt.) G. H. B. Wilson, Gen. List and R.F.C

Australian Force.

Lt. C. Le B. Brown, F.C.
Lt. W. A. Coates, F.C.
Lt. H. L. Fraser, F.C.
Lt. O. M. Lee, F.C.

The Meritorious Service Medal.

No. 403988 (frmly 51031) 1st Cl. Air Mech. (A./Cpl.) H. Anthony, R.F.C. (Lower Edmonton, N.); 3206 S.-Maj. W. A. Bradwell, R.F.C. (Birdwell, nr. Barnsley); 1669 Flt.-Serjt. C. W. Etheridge, R.F.C. (Bishop's Waltham, Hants); 403891 (frmly 50948) Serjt. T. Evans, R.F.C. (Merthyr); 3090 Flt.-Serjt. C. C. Gissing, R.F.C. (Northampton); 1221 Flt.-Serjt. W. J. F. Golding, R.F.C. (Kensington); 9029 Flt.-Serjt. F. S. Hall, R.F.C. (Sittingbourne); 3552 Flt.-Serjt. J. S. Hunt, R.F.C. (Blandford, Dorset); 4256 Serjt.-Maj. T. J. Huxter, R.F.C. (Barry Dock, Glam.); 11895 Serjt. A. L. Payne, R.F.C. (Blackheath, S.E.); 404005 (frmly 51204) Cpl. C. H. Phillips, R.F.C. (Cardiff); 3030 Serjt. F. W. Pound, R.F.C. (Liverpool); 403005 (frmly. 65382) 1st Cl. Air Mech. J. Rankin, R.F.C. (Kilmarnock); 1527 Flt.-Serjt. F. O. Walker, R.F.C. (Chudleigh, Devon); 7643 Cpl. F. E. Wilson, R.F.C. (Great Yarmouth).

Australian Imperial Force.

Aus./108 Serjt. W. A. Beard, F.C.; Aus./455 A.-Serjt. O. H. Coulson, F.C.; Aus./124 A.-Flt. Serjt. J. H. Rogers, F.C.; Aus./320 Flt.-Serjt. H. L. Sleeman, F.C.; Aus./104 Flt.-Serjt T. Watkins, F.C.

War Office, April 12th.

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing.—Flt. Comdrs.—From Flying Officers.—And to be temp. Capts. while so empld. :—Temp. Lt. G. E. Gibbons, Gen. List; Temp. Sec. Lt. W. E. Theak, Gen. List, March 21st; Temp. Sec. Lt. F. S. McClurg, Gen. List, March 28th.

Schools of Instrn.—Schools of Mil. Aeronautics.—Asst. Instr.—(Graded as an Equipt. Officer, 2nd Cl.)—The rank of Capt. R. C. Morgan, Canadian Local Forces, is now described, and not as in the "Gazette" of Feb. 26th.

GALLAY ACHIEVEMENTS

Their excellence and the reasons thereof

1. Our **system of construction** is proved by Government test to be 15 per cent. more efficient than any other type with equivalent water space and air orifice.
2. It is **lighter** per B. Th. U. dissipated than any other type.
3. It is **stronger** and yields less to impact than any other systems and owing to homogeneity of structure it will stand greater stresses vertically, horizontally or frontal.
4. The strength is inherent and not dependent on **tanks** or **casings**. The latter can be entirely dispensed with.
5. Every particle of metal used in construction acts as a **cooling agent.**
6. Each **waterway** is **regular** throughout its length.
7. **Air resistance** is reduced to the **minimum,** no blobs of solder obstruct the air passages, a regular wind cutting edge is always presented.
8. We have **reduced** the **radiator factor** to limits hitherto considered impossible.
9. Our system is suitable for **pump** or **Thermo** syphon.
10. We are Aero engineers and our staff comprise **specialists** in each department.

WE WERE THE PIONEERS
OF
LIGHT, STRONG and EFFICIENT RADIATORS

GALLAY RADIATOR CO., LTD.,

L. T. DELANEY, Managing Director.

Telephone—4826 Mayfair. Telegrams—"Galyradico, Wesdo, London."

L.T.D.

The following extracts, dealing with the work of the R.F.C. in Italy, are taken from a dispatch from Lt.-Gen. Sir Herbert Plumer, K.C.B., dated March 9th, 1918:—

The work of the R.F.C., under Brig.-Gen. Webb-Bowen, during the period under review has been quite brilliant. From the moment of arrival they made their presence felt, and very soon overcame the difficulties of the mountains. They have taken part in all operations, and rendered much assistance to the Italians in the air. They have carried out a large number of successful raids on enemy aerodromes, railway junctions, etc., and have during the period destroyed 64 hostile machines, a large proportion of which were German, and nine balloons, our losses to the enemy during the period being 12 machines and three balloons, a record which speaks for itself. . .

The artillery has rendered very useful service. Our gunners soon became accustomed to the altered conditions, and carried out many successful destructive shoots. A comparison of the photographs of hostile battery positions when our artillery entered the line with the positions now occupied shows that the enemy batteries have been successfully forced back almost throughout the whole front. . . .

[Sir Herbert Plumer pays compliments to the work of the Intelligence Service and to the co-operation of the Intelligence, Artillery, and the R.F.C.]

AIR MINISTRY, April 12th.

The following appointments are made at the Air Ministry:—

R.A.F.—S.O. 2nd Class: Capt. H. Foord, and to be temp. Maj. while so empld. (April 1st); Capt. (temp. Maj.) W. J. C. Kennedy-Cochran-Patrick, D.S.O., M.C. (April 6th).

MEMORANDA.—Sec. Lts. are granted the rank of temp. Capts. (ad.) while empld. as Courts-Martial Officers: G. Johnson, A. W. Rippon (April 1st).

Lts. to be temp. Capts., without the pay and allowances of that rank, while specially empld.: V. J. Hammond, L. F. Jones, A. L. Harrow-Bunn, M.C., A. L. Wilson, R. M. Nicholls, F. Tymms, M.C., S. T. Fripp (April 1st).

Sec. Lt. (Hon. Lt.) R. Cook to be temp. Capt., without pay and allowances of that rank, while specially empld. (April 1st).

WAR OFFICE, April 13th.

The following extract is from a dispatch from Lt.-Gen. Sir A. A. Barrett, Commanding Northern Army, India, describing the operations against the Mahsuds in March-August, 1917:—

Gen. Beynon, who had the use of aeroplanes (still a novelty on the North-West Frontier), began his offensive on June 13th, and in a series of fine actions and marches compelled the Mahsuds in a fortnight's time to sue for peace.

WAR OFFICE, April 15th.

REGULAR FORCES—ESTABLISHMENTS—R.F.C.—MIL. WING—Flt. Comdrs.—From Flying Officers, and to be temp. Capts. while so empld.—Lt. M. R. N. Jennings, Spec. Res. (March 20th, seny. from May 27th, 1917); temp. Sec. Lt. A. K. Cowper, Gen. List (March 24th); Capt. (temp. Maj.) H. F. Glanville, W. Ind. R., reverts from a Sqdn. Comdr., and relinquishes his temp. rank (March 19th, seny. from Sept. 25th, 1915).

Adjt.—Temp. Sec. Lt. H. Waddington, Manch. R., to be transfd. to R.F.C. Gen. List, and to be temp. Capt. (with pay and allowances as Lt.) while so empld. (Feb. 21st).

Park Comdr.—Capt. (temp. Lt.-Col.) F. A. G. Noel, Spec. Res., from a Special Appt. (graded as a Depôt Comdr.) to relinquish the rank of temp. Lt.-Col. and to revert to the rank of temp. Maj. while so empld. (Jan. 17th, seny. June 8th, 1917).

SPECIAL APPT.—Graded as a Park Comdr.—Lt. (temp. Capt.) J. Pearce, K. O. Sco. Bord., from an Equipt. Officer, 1st Cl., and to be temp. Maj. while so empld. (March 18th).

SCHOOLS OF INSTRN.—SCHOOL OF TECHNICAL TRAINING.—Asst. Instr.—Graded as an Equipt. Officer, 2nd Cl.—Temp. Sec. Lt. A. Patterson, Gen. List, an Equipt. Officer, 3rd Cl., and to be temp. Lt. while so empld. (March 21st).

GEN. LIST.—3rd Cl. Air Mech. H. Pender, from R.F.C., to be temp. Sec. Lt. (Jan. 11th).

* * *

The following are among the Decorations and medals awarded by the Allied Powers at various dates to the British Forces for distinguished services rendered during the course of the campaign. The King has given unrestricted permission in all cases to wear the Decorations and medals in questions:—

CONFERRED BY THE KING OF THE BELGIANS.

ORDRE DE LEOPOLD.

OFFICIER.

Bt. Lt.-Col. (temp. Brig.-Gen.) T. I. Webb-Bowen, C.M.G., Bedf. R.

DÉCORATION MILITAIRE.

37208 Cpl. A. W. Daniells, R.F.C. (Goldsboro Road, S.W.).
12515 1st Cl. Air Mech. A. Langstaffe, R.F.C. (Boston).

CROIX DE GUERRE.

Temp. Lt. (temp. Capt.) C. B. Baker, Oxf. and Bucks L.I. and R.F.C.
Temp. Capt. K. F. Balmain, R.F.C.
Sec. Lt. W. D. Bostock, R.F.C. (Spec. Res.).
Temp. Capt. W. P. MacD. Brettell, R.F.C.
Temp. Lt. L. D. Brown, R.F.C.
Maj. A. D. Carter, D.S.O., New Brunswick R. (Canadian Forces) and R.F.C.
Capt. (temp. Maj.) J. A. Cunningham, R.F.A. and R.F.C.
Capt. E. A. Fawcus, Northd. Fus. and R.F.C.
Temp. Sec. Lt. C. R. H. Ffolliott, Linc. R. and R.F.C.
Temp. Sec. Lt. R. Harris, R.F.C.
Capt. (temp. Maj.) M. K. Horn, M.C., R.F.C. (Spec. Res.).
Lt. (temp. Capt.) R. H. Jarvis, M.C., R.F.C. (Spec. Res.).
Temp. Capt. G. Knight, M.C., R.F.C.
Lt. (temp. Capt.) J. McKelvie, R.E. and R.F.C..
Temp. Capt. L. Mason, M.C., R.A.
Temp. Sec. Lt. W. F. Mayoss, R.F.C.
Temp. Capt. A. D. Pearce, R.F.C.
Lt. R. C. Purvis, W. Rid. R., and R.F.C.
Temp. Sec. Lt. R. W. Rose, R.F.C.
Maj. H. S. Walker, Ches. R. and R.F.C.
Temp. Sec. Lt. W. Walker, R.F.C.
Bt. Lt.-Col. (temp. Brig.-Gen.) T. I. Webb-Bowen, C.M.G., Bedf. R.
43958 1st Cl. Air Mech. L. F. Bolton, R.F.C. (Westminster, S.W.).
10551 Cpl. E. Bradshaw, R.F.C. (Tonbridge).
88059 2nd Cl. Air Mech. F. Broscomb, R.F.C. (Hunslet, Leeds).
15422 1st Cl. Air Mech. B. Brown, R.F.C. (Bitterne, Hants).
3497 Cpl. W. J. Collett, R.F.C. (Leighton Buzzard).
8545 1st Cl. Air Mech. C. A. Davey, R.F.C. (South Norwood).

* * *

The following names should have appeared among the recipients of Military Medals on March 13th, instead of as "mentioned in dispatches":—

AUSTRALIAN IMPERIAL FORCE.

Aust./120 Serjt. B. F. Jones, F.C.
Aust./20 Serjt. R. Lonsdale, F.C.
Aust./1750 1st Cl. Air Mech. H. S. Raphael, F.C.

FROM THE COURT CIRCULAR.

ROYAL TRAIN, April 9th.

In the afternoon Their Majesties proceeded to Messrs. Robe and Co.'s premises, and after inspecting the works left for Lincoln Cathedral.

Sir Henry Fowler (Assistant Director of Aircraft Production) was in attendance, representing the Ministry of Munitions.

WINDSOR CASTLE, April 11th.

This morning The King and Queen visited an Air Station and were received on arrival by Brigadier-General H. D. Brigg and Captain the Prince Albert, R.A.F.

On the conclusion of the inspection Their Majesties left by special train for Windsor, reaching the Castle shortly after 6 o'clock.

WINDSOR CASTLE, April 13th.

The King, attended by the Gentlemen in Waiting, went to London this morning.

The following had the honour of being received by the King at Buckingham Palace, when His Majesty invested them with the Insignia of the Order into which they have been admitted:—

THE DISTINGUISHED SERVICE ORDER AND THE MILITARY CROSS—Maj. John Kinnear, The King's (L'pool Regt.) and R.A.F., and Capt. Clive Warman, R.A.F.

The King then conferred decorations as follows:—

THE MILITARY CROSS.—Capt. Malcolm Vyvyan, R.G.A., attd. R.A.F.; Lt. William Black, Cameron Highlds., attd. R.A.F. Sec. Lt. John Rodger, The King's Own (Yorks. L.I.), attd. R.A.F.

THE ALBERT MEDAL.—Lt. Frederick Smith, R.A.F. At an aerodrome a bomb accidentally exploded in the mouth of a dug-out forming a bomb store, which contained a large number of bombs packed in wooden cases and a quantity of rockets. Two men were killed by the explosion, and another man, who was severely injured, was thrown down into the store. Dense volumes of smoke issued from the dug-out, and there was great risk of a further explosion. On hearing a call for help, Lt. (then Sec. Lt.) Smith, accompanied by Serjt. William Ernest Rhoades—who has also been granted the Albert Medal—immediately entered the dug-out, and they succeeded in rescuing the injured man, who would otherwise have been suffocated

OFFICIAL COMMUNIQUES.

MILITARY.

G.H.Q. COMMUNIQUÉS.

APRIL 9th, 8.40 p.m.—With the exception of a few flights at a low altitude, no flying took place on the 8th inst. owing to mist and rain.

One hostile balloon was brought down.

None of our aeroplanes is missing. One of our aeroplanes which was reported missing on the 7th inst. has since been located.

APRIL 10th, 8.2 p.m.—During the morning of the 9th inst. the whole front was covered in mist, which prevented any of our aeroplanes leaving the ground.

The Design and Construction of Internal Combustion Engines, with special reference to Aero Engines.—III.

BY C. SYLVESTER.
Author of "The Conversion of Electrical Machinery," "Testing Motors and Motor Starters," etc., etc.

Internal Combustion.

We have dealt to some length with the laws of pressure, lume, and the expansion of gases. So much so that the ident will have a clear idea of the methods adopted for lculating the amount of work done. It is now essential that e various cycles of operation should be carefully considered. In practice it may be said that internal combustion engines e designed upon the known rise of temperature, and the nsequent rise of pressure which is the direct result of the plosion. This should be constantly borne in mind by the signer, because it is upon these factors that the mechanical sign of the engine and the necessary strength of the various rts are determined.

Cycles of Operation.

Internal combustion engines differ inasmuch as some operate on what is known as the "Two Cycle" plan, while others erate upon the well-known "Otto" or four-cycle plan. our-cycle engines are most generally used.

Two-Cycle Engines

In a two-cycle single-acting engine the exhaust gases are pelled through a number of ports in the cylinder walls. These rts are uncovered by the piston at the end of the stroke. If a o-cycle engine is designed double-acting, these exhaust ports e placed approximately in the centre of the cylinder. In this se the piston is made proportionately long, and the exhaust rts serve both ends of the cylinder in turn.

From this it will be seen that the action of the piston has actically no effect upon the clearing of the exhaust gases. he result is that they are got rid of by other means, usually a ecial air pump which supplies a scavenging pressure of about ght pounds per square inch.

Four-Cycle Engines.

The action of a four-cycle engine may be said to be as llows:—

The first stroke, termed the suction stroke, sucks petrol, gas, other explosive mixture and air into the cylinder.

The second stroke, termed the compression stroke, compresses e mixture into a very small space at the end of the cylinder, rmed the combustion chamber. Just before the piston reaches e maximum compression point the charge is fired or ignited.

The piston, having now passed the top dead-centre point, com-ences upon the expansion or working stroke.

The fourth stroke, sometimes termed the exhaust or scavenging. roke, merely expels the burnt gases out through the exhaust ort.

Fig. 4 shows the position of the piston in the cylinder at the mmencement of each stroke.

Valve Operation.

To enable the four-cycle operation to be carried out, it is apparent that means must be provided to allow the gas to enter the ylinder and for the exhaust gases to leave it. This arrangement is effected by means of inlet and exhaust valves, which are perated by means of a camshaft.

Referring again to Fig. 4 it will be seen that the cylinder receives its combustion charge once every two revolutions of the rankshaft. Thus the valves operated by the camshaft must pen once every two revolutions.

Briefly, the inlet valve is open at the commencement of the first roke, and it remains so until the completion of the stroke. It closed during the remainder of the two revolutions.

The exhaust valve opens when the piston has travelled almost 7/8 of the working stroke, and it closes at the end of the exhaust stroke. From this it will be seen that, in the whole of the four cycles, the exhaust valve remains open for a longer period than the inlet valve.

As stated above, the inlet and exhaust valves are operated by a cam shaft. That is, they are opened by cams fitted on a shaft. The closing operation is, however, effected by means of springs, which are compressed by the cams when the valves are opened.

In some types of petrol engines the inlet and exhaust valves are on one side of the cylinders. When this is so it is only necessary for one cam shaft to be fitted. If the inlet valves are fitted on one side of the cylinder, and the exhaust valves are on the other side, then it is necessary that two cam shafts should be fitted.

As previously stated, the speed of the cam shaft is exactly half that of the crank shaft, and to obtain this reduction of speed the two shafts are connected together with a two-to-one ratio of gearing. The type of gearing used depends upon the type of engine. Thus, when the cam shaft operates the valves by means of tappet rods, the gearing is of the spur type. If the valves are operated by a shaft fitted above the cylinder head the connection between the crank shaft and the cam shaft is effected by bevel gearing, the actual transmission being carried out by a vertical shaft. The design of valve springs will be dealt with when valve design is considered.

Vertical Cylinder Engines

Up to the present we have been considering the operation of one cylinder only. It is therefore necessary to point out that the number, type, and position of the cylinders depend upon the type of engine. Some types of aero engines are fitted with vertical cylinders, others with the cylinders arranged in the shape of a V.

In considering the six-cylinder vertical type engine, it may be said that the crank shaft is fitted with six cranks, which, for the purpose of illustration, are numbered 1 to 6 respectively. The setting of Nos. 1, 2, and 3 cranks are exactly 120 deg. apart, as are Nos. 4, 5, and 6. Nos. 1 and 6 are 0 deg. apart. Nos. 2 and 5 are the same, as are Nos. 3 and 4. This is made quite clear in Fig. 5, which shows cranks 1, 2, and 3 in section. Cranks Nos. 6, 5, and 4 are immediately behind Nos. 1, 2, and 3.

V Cylinder Engines.

Some types of engine are known as the V type engine. This means that the cylinders are set in the shape of a V. The Sturtevant model, 5A, 140 b.h.p., aero engine, is a typical example of the V type engine. The design of this engine will be fully dealt with in a later article.

The setting of the cranks of a V type engine depend upon the number of cylinders. From this it is not meant that a twelve-cylinder engine would be fitted with twelve cranks; it would have six cranks only, the setting of which would be the same as those on a six-cylinder vertical type engine. In this case two connecting rods are fitted on one crank.

In Fig. 6 we find the plan of a twelve-cylinder engine. Cylinders 1 and 12 have their connecting rods fitted to crank No. 1. Nos. 2 and 11 are fitted to crank No. 2, and so on.

It may be a little difficult to understand the exact position of the pistons in any or the whole of the cylinders at any one time. In order that this may be more clearly understood we will consider one pair of cylinders only. Since the two connecting rods are fitted to the same crank, it is clear that the only time

that the two pistons are in the same position in their respective cylinders is when the crank is exactly between the cylinders in either the top or bottom positions

This is shown in Fig. 7, where the crank is exactly between the two cylinders in the top position. From this diagram one can see that if pressure be exerted on piston No. 1 the direction of rotation will be as indicated by the arrow. At the same time, piston No. 2 is moving towards the cylinder head until the position indicated by the dotted line is reached. In this position No. 2 piston is in the position known as "top dead centre," but piston No. 1 has yet some distance to travel in the same direction before "bottom dead centre" is reached, namely, to the point indicated by the dotted line A.

If Figs. 5 and 7 are now carefully studied it will be seen that the position of the pistons in Nos. 6 and 7 cylinders are the same as those in Nos. 1 and 12, and that the difference between 1 and 12 and 2 and 11 will be 120 deg., that is, if we take two strokes as being equal to 360 deg.

Order of Firing.

The order of the firing of all internal combustion engines depend upon the crank setting. In a four-cylinder engine, where cranks Nos. 1 and 4 are set 180 deg. from Nos. 2 and 3, the order of firing will be 1, 2, 4, 3, or 1, 3, 4, 2. Six-cylinder engines usually fire in the order, 1, 5, 3, 6, 4, 2.

This applies to petrol engines only. Where large Diesels are concerned it is of the utmost importance that the order of firing should prevent two adjacent cylinders firing after each other. If this were allowed it would be found that a considerable amount of back pressure would exist in the main exhaust pipe.

It is therefore excellent practice to arrange the order of firing so that the exhaust gases from one cylinder do not affect, to any great extent, the exhaust gases from another cylinder in their passage to the silencer. It has been found from experience that the best order of firing of large Diesel engines is 1, 4, 2, 6, 3, 5.

Lubrication.

Lubrication in all types of internal combustion engines is a matter of great importance. In aero engines, where a pilot depends upon his engine to never exceed a pre-determined amount of oil consumption, this is still more important.

The majority of oil consumed by an aero engine is burnt by the heating effect of the cylinders, the remainder lubricates the crank shaft and connecting rod bearings, etc.

The oil supply to all bearings and gearing is forced, the pressure varying from five to thirty pounds per square inch, according to the type and b.h.p. of the engine. The circulation of the oil is accomplished by means of a pump, which draws the oil through a suction pipe to a filter. From here it is distributed by means of small pipes to the exact points where it is desired that the oil should be delivered. After doing its work the oil flows into the base of the engine, when the operations are repeated. For very large Diesels and oil engines the "splash system" of lubrication is adopted. This system may be described as a large bath of oil, the bath forming the base of the engine. As the crank shaft rotates the big-ends of the connecting rods dip into the oil, and splash it over the small-ends, and inside the cylinder walls.

(To be continued.)

THE MASS OF OFFICIALDOM.

The following letter deserves attention:—

Sir,—I must say I sincerely endorse the sentiments set forth under the heading "The Mass of Officialdom." The only way it seems is to hammer at them hard, week after week, until someone notices it and comments upon it.

Not only do these official pests affect the men physically (as is often noticed), from the directors to the boy who does everything, but in another and more destructive way; it affects them, and everyone, in a subtle, or psychical, sense—shall I say? It entirely takes the originality and ingenuity right out of the employers, and employed. I have noted dozens of cases.

England has always been more or less in the rut, but there is no excuse for making new ruts to get stuck in. No sooner does a man evolve an idea, than it is thunderously squashed by some meddling official, who would be far better employed picking weeds or filling sandbags, and whose sublime ignorance merely serves to keep him in his position. I have dealt with such, much to my sorrow.

I know of an ex-barman from the Vauxhall Bridge Road who is an inspector of aircraft material, and who meddles and muddles all over his district in a car, and has gallons of petrol to joy-ride the whole of his leisure hours.

Before I close, here is an actual chestnut which happened not far from here, and which I witnessed. We had eighteen extra long pistons standing on the bench with the rings off. An official examiner was there, and picked up one of the pistons and carefully examined it, remarking, "You have got some awful scratches in this 'shell.'" Of course I said "What 'shell'?" He then said "What's this, if it isn't a 'shell'? I thought they (indicating all the pistons) were 'shells'!"

Do you blame us for smiling? This is an absolute fact, and I could hardly credit the man's ignorance. That was in the early stages of the war. Now my ears and eyes are quite accustomed to this kind of thing. I could see an aero engine mistaken for a case hardening furnace, and simply yawn with boredom. Do you think such mis-management will win us the war? I don't!

The Commercial Attache.

Can He Help us, and if so How?

BY "MEDWAY."

In a recent note, I tried to show how we could, and ought to, make some real use of the services of our Trade Commissioners in the Empire Overseas. The Case of the Commercial Attaché in a foreign country is somewhat similar but not quite on all fours.

A few years ago it would probably have been mainly a waste of time to bother about the Commercial Attaché or the Consul at all. The poor fellow was generally paid so little that most of his time had to be spent in devising means of living within his income, and he had none to spare for considering other people's needs.

Moreover, being badly paid, it was generally recognised that, despite his best efforts at official dignity, he was probably no one in particular—a person of very limited influence and status.

Furthermore, the mere fact that he accepted such a rotten salary weighed against him.

A successful business man cannot raise much respect for anyone who is prepared to settle down for life on an annual income considerably less than the weekly salary of a popular music-hall comedian. Thus nobody—and probably we may include the Consul himself—had much faith in his ability to help.

The men who did best out of the business were most likely to be found among the "unpaid" Consular staff, who—being mainly foreigners, and frequently Germans—got a sort of local status out of the positions they held, and, in some cases, were probably in receipt of subsidies from Berlin.

But the basic trouble about the whole British Service, in so far as it was British, was the old idea that any connection with commerce or industry was a degrading thing which soiled the hands, shirt-cuffs, and souls of those who participated in it.

The diplomatist—generally supposed, rightly or wrongly, by the outsider to be a sort of gilded super-liar—was universally admitted to be a person of distinction.

The Commercial Attaché and the Consul were, by comparison at least, very small beer, both socially and financially. Consequently, they never got a fair chance.

There is, however, some hope that, from now onwards, things will be different.

The Commercial Attaché will be the right-hand man of the Ambassador, and his advice within his own sphere will not be lightly overlooked.

He will be given weight sufficient to enable him to balance and counter the intrigues which so often result in important contracts going to foreign manufacturers when Great Britain had the best right to them. The "Nation of Shopkeepers" is at last trying to give up feeling ashamed of keeping a shop, and is to attempt to advertise and sell its wares.

Consequently, the suggestions that I have made as to utilising the Trade Commissioners within the Empire apply equally to the Commercial Attaché.

We shall want him to find out for us where there is room for aerial services, and we must let him know what sort of information we expect from him or his staff.

We want, also, his personal offices in the way of educating foreign Governments up to an appreciation of their own needs. It is no good to us if they want aerial services, and do not know that they want them.

The Commercial Attaché can talk the language, and can meet and entertain the right people, and teach them to take an up-to-date point of view.

There are plenty of cases in which the necessity for acceleration of the mails is the main cause of very heavy capital expenditure on railways or roads.

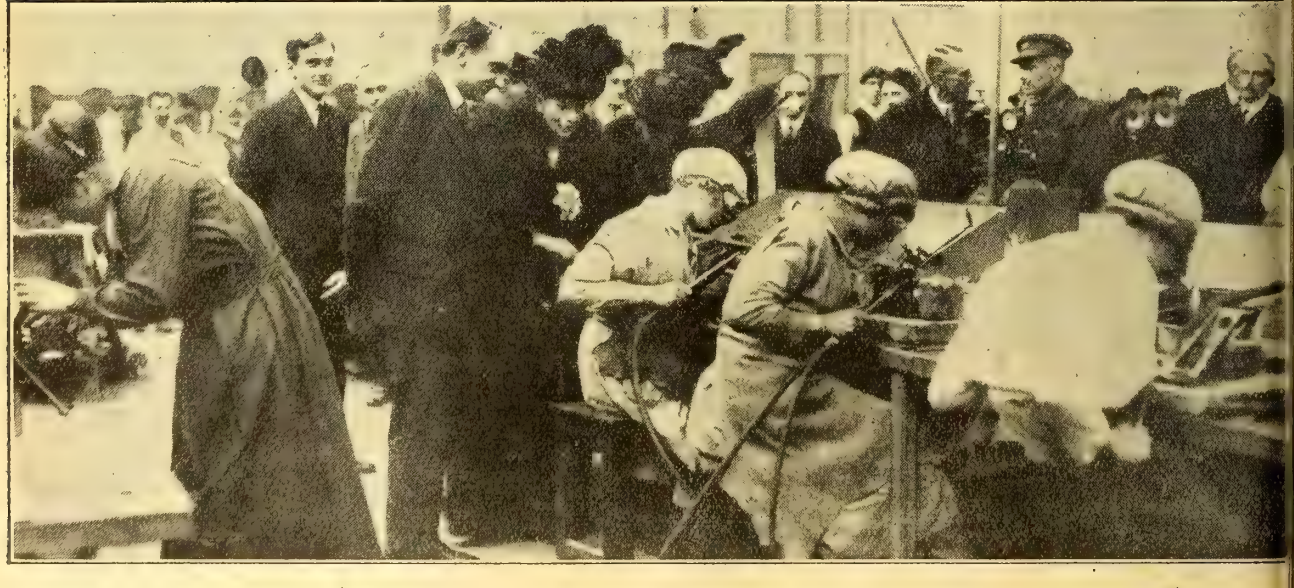
There are plenty of countries in which communications are generally conducted in a thoroughly leisurely manner—I refer not to the railways of Kent, but to places farther afield—to where there are a limited number of busy men to whom time is money.

Given a slow road service and an express aeroplane service, the need for a railway would often be removed, or postponed until the project has a decent chance of paying its way almost at once.

This is the kind of point which the Commercial Attaché will rub in, provided that we feed him with the necessary knowledge and keep on jogging his elbow and reminding him of our existence.

Having brought his people nearly up to the scratch, we want him to go ahead and to do something for us which it is not—should not be—necessary to ask of the Trade Commissioner.

He must keep his eye open for foreigners waiting to snatch the business he has nursed. He must see that people are thoroughly impressed with the superiority of British machines.

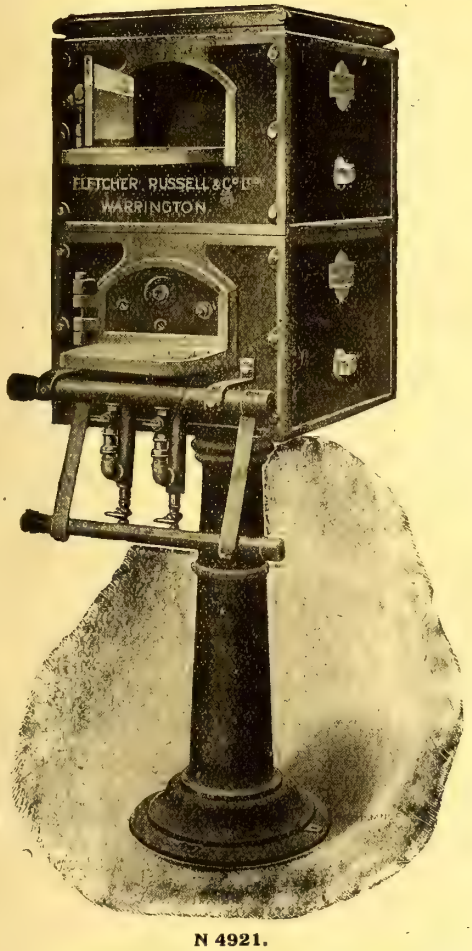


If he is to do this, he must be able to argue the case, and must provide him with the arguments. He has many things to think about, and none too much time to spare, so we must put our points to him shortly and very clearly, assuming that he is no expert.

If we take these precautions, then we stand a good chance of getting business. If others get it instead of us, and our many tame Government places a big order for German aeroplanes for all the local services, then, at least, we can fix the blame, and it does not fall upon us.

I assume that our commercial officials will be given decent entertainment allowances, and that neither an exaggerated idea of politeness to foreign competitors, nor an over-scrupulous notion of how to treat officials with open hands and empty pockets, will be held to be sufficient excuse for failure when more direct measures seem destined not to succeed.

The aeroplane business will be rather a queer one. The trading will not be of the ordinary retail kind.



This is all the more reason why, if the Industry takes the trouble to interest the official, the official—if competent, as I honestly believe he will be—will be likely to take special pride in bringing off something big for the Industry.

The Liberty Engine and Other Things American.

The 13th Annual Conference of the American Society of Automotive Engineers was held in New York City on Jan. 9th-10th.

The most important topic before the Professional Session, also held on Jan. 10th, the "Reasons Behind the Liberty Aircraft Engine," gave plentiful room for discussion at all points, and the three addresses were followed by half an hour of questions from the floor, which were answered by Major Jesse G. Vincent, formerly Vice-President of the Packard Motor Company, who, with Major Hall, of the Hall Scott Company, was called into the Reserve Engineering Service, and designed the Liberty motor.

[The glowing official account of the labours of these two gentlemen, which resulted in the production of the designs of the Liberty Engine in 36 hours, or some such period, will be within the memory of readers of this paper.—Ed.]

The account of performance and production possibilities given by the speakers seemed to bring general satisfaction, but what put the final touch on the general conviction, apparent among most of the engineers, that the Liberty motor was actually living up to its promises, was the statement made at the close of the discussion that several of the Allied Governments have placed orders in this country for the motors.

[No indication appears to have been given of the numbers ordered. After all, one sample engine, intended to be run to destruction as an experiment, constitutes an order.—Ed.]

Much information about production had to be withheld for military reasons, and figures as to the actual speed which the motor will develop were not given for the reason that the designers of the engine were careful to point out that the planes themselves are a very important factor in this consideration.

[A very interesting discovery, indicating that the American Aircraft Production Board is beginning to understand that important question, "What is an aeroplane?" or perhaps the other, equally interesting. "What is the difference between an aeroplane and an airplane?"—Ed.]

The following points as to the Liberty motor were brought out in the course of the afternoon's discussion :

1. The primary consideration in design was the meeting of the known possibilities of production by American factory methods. Certain features of foreign engines, the building of which required highly specialised factory technique such as was not compatible with quantity production, would be impossible for use in the enormous number of aeroplanes which is contemplated by the American aircraft programme. The designers had to consider the present capacities of production in American factories by American methods, as well as the possibilities of increase.

2. All the engineering talent in the American aeroplane and automobile industries was placed at the disposal of the Government, so that when Majors Vincent and Hall settled down to the completion of the design they had available all the information possessed by American manufacturers and the researches previously made by some 40 or 50 other engineers. The motor which resulted is said by those who were engaged in its design to combine the best points of all motors hitherto designed in America.

[Which is not necessarily a testimonial to its originality or its inherent merits.—Ed.]

3. Although the possibility of production was the first desideratum, it is asserted that the Liberty motor is as good as, if not better, than any foreign engine now being built. When the work of designing the new motor was just begun the Allied Governments were asked for suggestions from the engines now in use in their aircraft. All of the major Allies replied that they were severally engaged in developing a new and better motor. In consequence, with the aid of such suggestions from Allied sources as were of use and those contributed by the American engineers, the designers set to work to build an engine which should embody all the improvements likely to be thought of abroad during the period of design and construction. They feel confident that when the Liberty motors are actually in use on the Western front there will be no foreign motor of equal worth in use.

[The charming modesty of this statement disposes once and for all of the statement by a mere practical American aero-engine mechanic that "the United States of America is now engaged in piling up the World's Record Junk Heap." Meantime, one would merely indicate that if the Liberty motor is to beat one or two of the latest British products it will have to "go some."—Ed.]

4. Liberty motors are now being turned out and American aeroplanes are being equipped with them every day. When the tide of production is in full swing they will be wholly standardised, but at present, while standardisation is in effect with regard to most parts, a few must for a little time to come be made individually because the master gauges are not ready for all factories.

5. Although it was not definitely taken up in the meeting, it was declared afterward by the chairman, Charles M. Manly, vice-president of the society, chief inspecting engineer of the Curtiss Aeroplane and Motor Company, and a member of the National Aircraft Standards Board, that every possible provision is being made for the improvement of the design with the least possible interference with production. Aeroplanes are rapidly being improved, of course, by the interchange of captured machines with new devices between the opposing armies, but the men who are in charge of the Government's aircraft programme are said to feel that the system of production will make it possible to introduce new features or improvements on later lot orders so that the Government will never be tied up with a great number of obsolescent machines in process of manufacture.

Later, Major Vincent declared he believed that with all the alterations that might be necessitated by subsequent experience, 95 per cent. of the present features of the Liberty motor would be retained.

[One hopes that Major Vincent will be justified of his hopes of his offspring, but there is such a thing as counting chickens before they are hatched, and imagining geese to be swans.—Ed.]

6. "Many thousands" of Liberty motors will be turned out in the year 1918, and American factories will be able to produce at least twice as many per week as they would be able to manufacture of any foreign type of engine.

The Liberty motor is to be used on machines of every type—speed scouts, battleplanes, observation and bombing machines, and seaplanes, though those at present in process of manufacture, according to Major Vincent, are intended only for heavy battle and bombing planes.

[It would be interesting to know whether Major Vincent has ever seen a "heavy battleplane," because the type is not common in Europe, even in the most advanced aerial services.—Ed.]

There are only two varieties—a high-pressure engine for the use of battleplanes at very high altitudes, where the atmosphere is rarefied, and a low-pressure motor for the use of seaplanes working principally in the detection of submarines, and hence near sea level, where the air pressure is heavy.

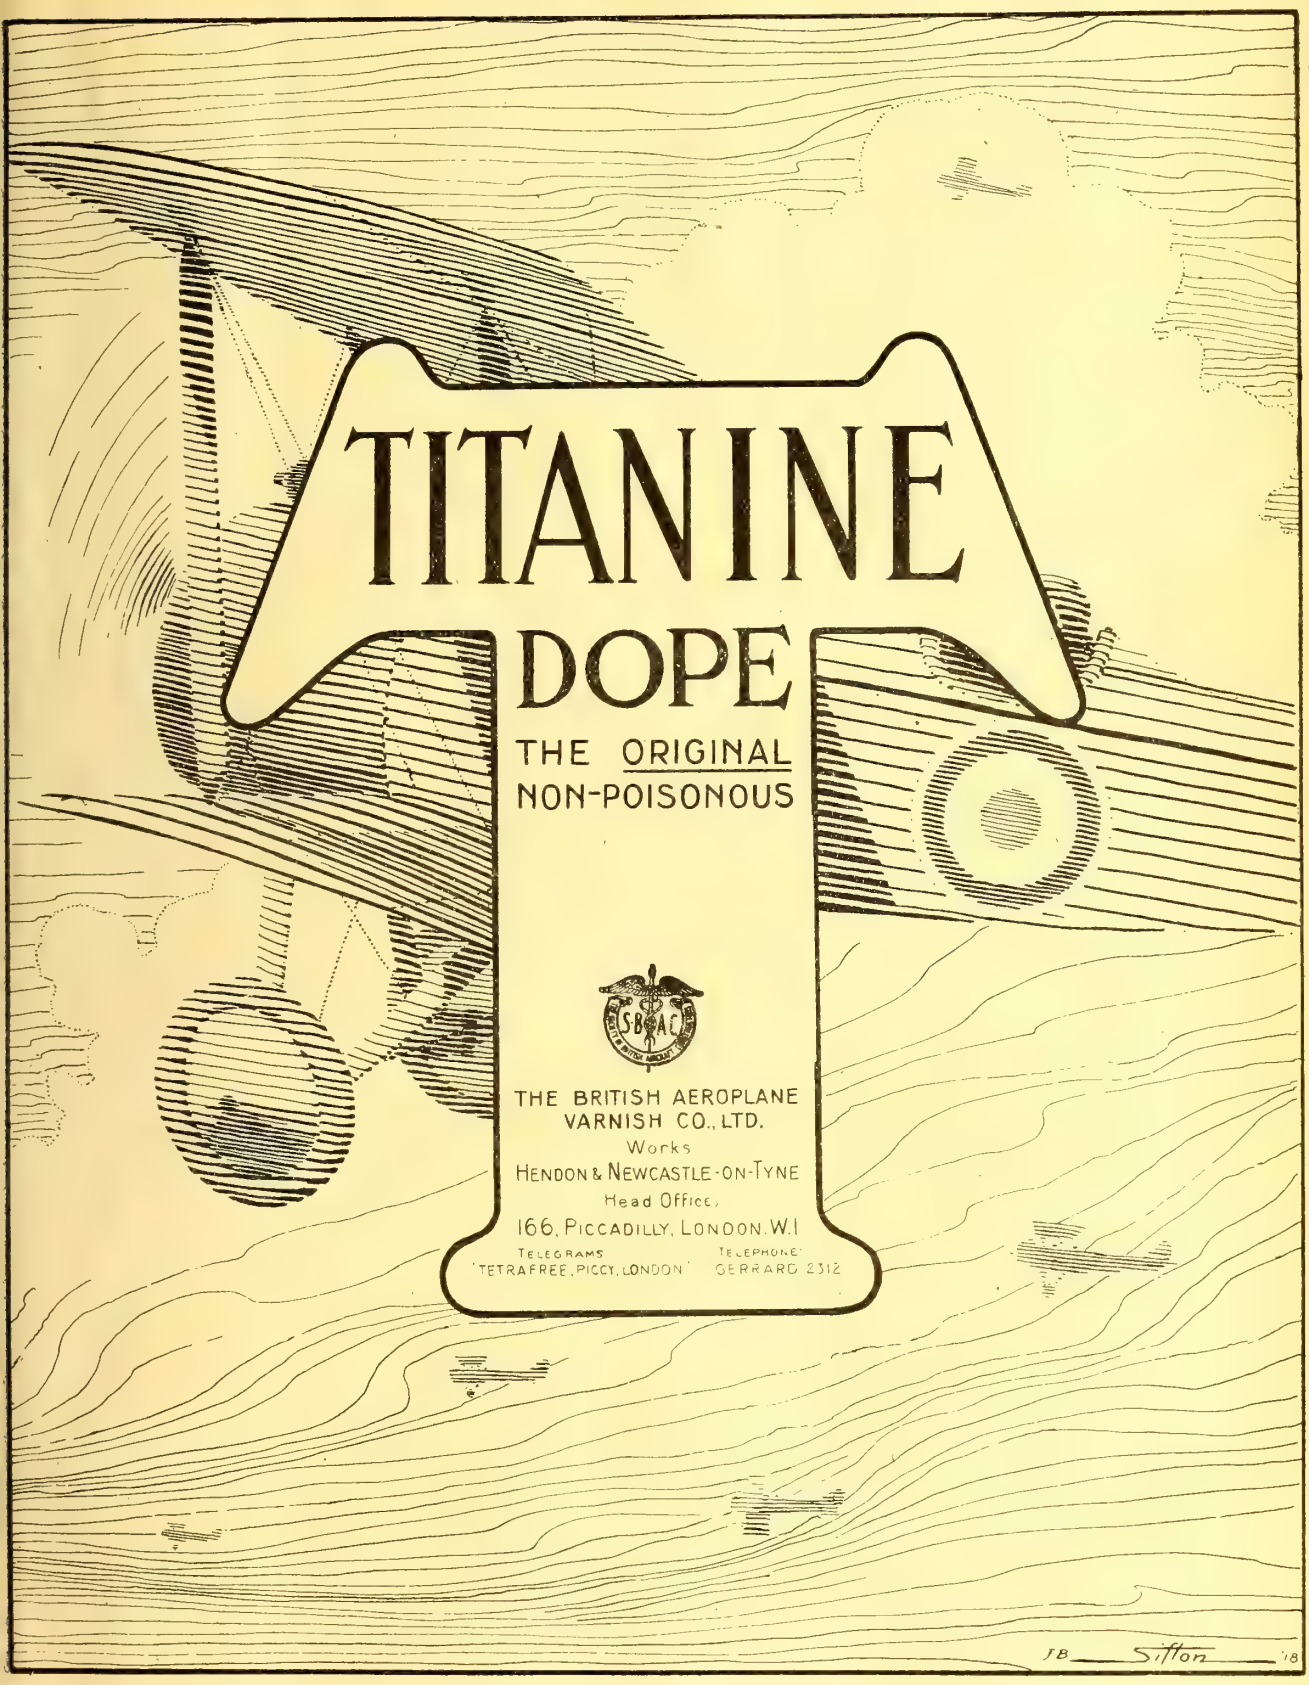
As showing the endurance of the motor it was said that the high-pressure engine designed for use three or four miles in the air had been run consecutively for eight hours at sea level without showing any weakness.

In the vacuum chamber of the Bureau of Standards in Washington, where conditions of temperature and air pressure obtaining 35,000 feet in the air—two miles higher than any aviator has ever flown—can be simulated, the high-pressure Liberty motor has been run for 50 consecutive hours. This, of course, is longer than any possible flight, for no aeroplane could carry enough gasoline.

[There is, however, some difference between a partly throttled test on a bench and a full-bore run at varying levels and speeds in the course of an air fight.—Ed.]

Incidentally it may be remarked that improvements in the propeller are part of the plan of inventors now working on the improvement of the engine. It weighs about 800 pounds.

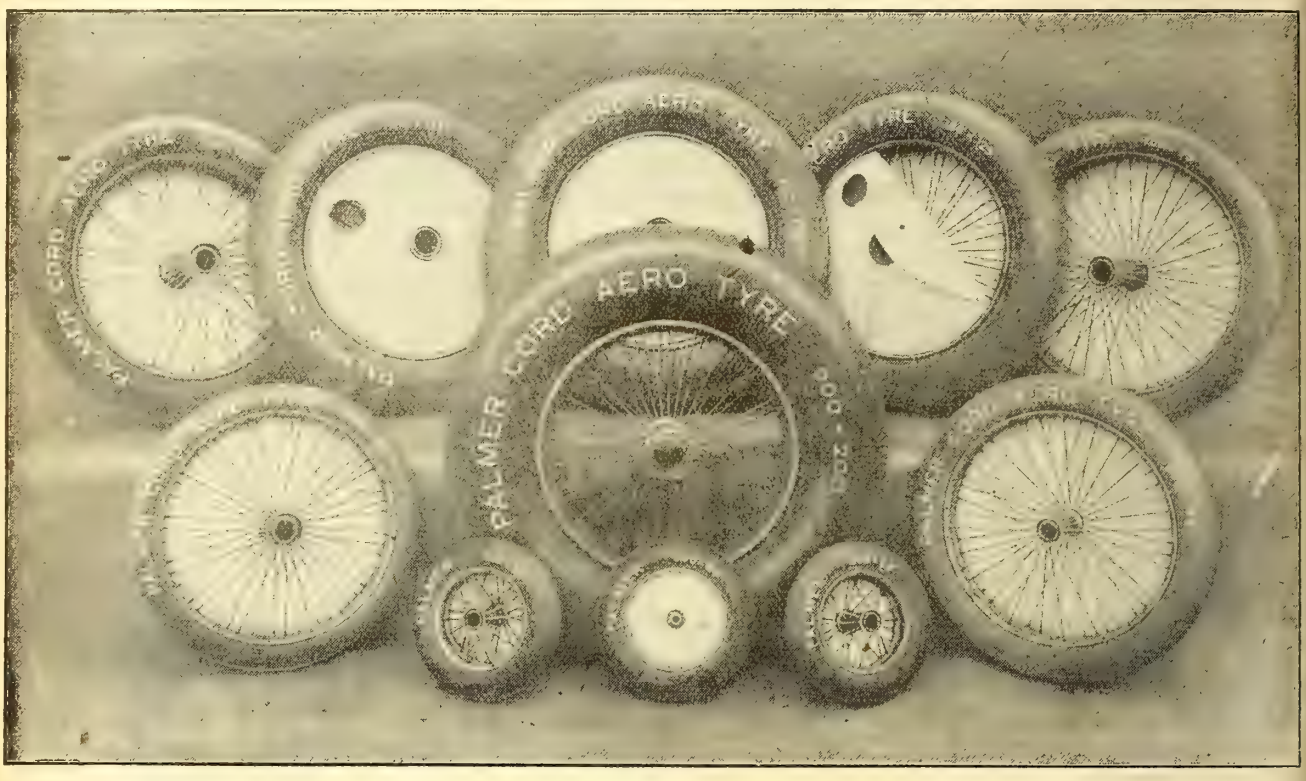
[It seems that by the time all these standardised thousands begin to come through, it will be well for Major Vincent to come to England and learn the latest ideas abour engine weights.—Ed.]



Questions from the floor were aimed at a comparison of this with the Rolls-Royce motor, regarded as one of the best of foreign design. Major Vincent said that the Rolls-Royce, with a weight of 950 pounds, had never authentically developed more than 360 horse-power. Someone asked if it were not true that the Rolls-Royce could really do better than that. "I don't know," he said, "but I do know that the Liberty motor can do 50 horse-power better than the Rolls-Royce. As a matter of fact, the Liberty motor has possibilities which have not been completely fathomed as yet. We have something up our sleeve."

[A new engine, one hopes.—Ed.]

The average of only two pounds weight per horse-power, according to Major Vincent, was something that Continental designers had desperately tried for and failed.



H. M. Crane, who as chief engineer of the Wright-Martin Company is manufacturing the Hispano-Suiza motors in this country, followed Major Vincent and corroborated his statement that the Liberty motor was best adapted to American production. "It will answer for all the requirements of the war," he said, "and after the war will be a factor in the remaking of the whole automotive industry. We have to begin to think now of what we are going to do after the war is over."

[Does Mr. Crane indicate the fitting of Liberty engines into Ford chassis?—Ed.]

The "Guardian Angel" Parachutes

THE GUARDIAN ANGEL PARACHUTES
TRADE MARK
(REGISTERED)

THE CLASS OF OUR LIFE-SAVING EQUIPMENT.

The basic characteristics of our Parachutes, which differentiate them from all others, and for which we hold master-patents, are automatic (i.e., compellative) opening, and static and kinetic control (i.e., control at rest and in action) of all their component details. The ordinary parachute is under no sort of control, and what we have accomplished is to convert this most insubordinate Apache of the Air into a staid servitor, incapable of acting in any other than the designed way. We have made the Parachute into an automatic machine, so that failure to open and entanglement of rigging has become a physical impossiblity. Every Type of Parachute made by us possesses these paramount and indispensable principles of machine action. The aviator makes his jump, and the Parachute automatically does the rest.

THE RANGE OF OUR LIFE-SAVING EQUIPMENT.

Life-saving Parachutes for school machines on the Training Grounds.

Life-saving Parachutes for heavy bombing machines, fighters, and scouts.

Life-saving Parachutes with minimum weight and without additional air resistance for the fastest machine that flies, and capable of release from any vertical or horizontal angle, or when flying upside down.

Solo-Parachutes for use from Airships and Observation Balloons, with a high but constant-speed initial drop from a fired gas-bag, automatically opening into the low-speed descent required for a safe landing.

Basket-Parachutes for instantly detaching the basket containing two observers, their instruments and records, from a fired gas-bag, with high-speed initial fall, changing automatically to slow-speed descent for the safe landing. Parachute instantly released on landing, to avoid dragging the basket.

Variable-speed Parachutes, to permit a sudden high-speed drop, controlled by the Parachutist, to escape from an enemy aeroplane, and to stop on any portion of the grade of descent to avoid an objectionable landing. This variable-speed apparatus is applicable to the whole range of our Parachutes.

Non-spinning shock-absorber slings, taking all shocks off Parachute and man.

Aviator's Harness, distributing the stresses over those parts of the body best able to sustain them, and instantly releasable when alighting on land, on a roof, in a tree, or in water.

OUR EQUIPMENT IS THE RESULT OF ENGINEERING SCIENCE APPLIED TO DIFFICULT AIR PROBLEMS. WE BELIEVE THAT ITS EXTENDED USE WILL DOUBLE THE FLYING LIFE OF OUR FIGHTERS AT THE FRONT.

RELIABILITY—First. RELIABILITY—Second. RELIABILITY—ALL THE TIME.

Manufacturers of Steel of every description, including

HIGH GRADE NICKEL STEEL & FORGINGS

for Naval and General Marine Purposes.

Special Heat Treated Alloy and other Steels for Aircraft and Automobile Purposes

IMPORTANT SPECIALITIES:

S.S.G. **A SPECIAL NICKEL CHROME GEAR STEEL.**
FOR AIR OR OIL HARDENING. When treated this steel has exceedingly tough properties and is specially suitable for Gear Wheels, Connecting Rods, etc.

S.G.W. **A NICKEL CHROME STEEL IN FOUR GRADES.**
Eminently suitable and strongly recommended for Gears, Crankshafts, and other highly stressed parts, and having exceptional machining qualities. Combines unusually heavy shock-resisting and wearing properties with silent running.

G.P.S. **A HIGH GRADE ALLOY CASE HARDENING STEEL**
for severely strained parts, such as Gear Wheels, Gudgeon Pins, etc.

Continental Steel Works and Novo Steel Works, Sheffield.

INCREASED OUTPUT
DEMANDS
GREATER ACCOMMODATION

To meet calls for accelerated production The WILFLEY COMPANY offers its services for the provision of Factory Buildings of all types in **STEEL, FERRO-CONCRETE, BREEZE SLABS, ASBESTOS SHEETS, BRICK** and other Construction.

Tarrant, W. G. Steering or controlling aircraft. No. 5813. April 4th.
Tarrant, W. G. Means for operating, stabilising, or steering devices of aeroplanes. No. 5814. April 4th.
Tarrant, W. G. Landing and launching carriages or chassis for aircraft. No. 5818. April 4th.
Tarrant, W.G. Landing-skids for aeroplanes, etc. No. 5882. April 5th.

Complete Specifications Accepted, prints of which can be obtained on and after April 25th, 1918.

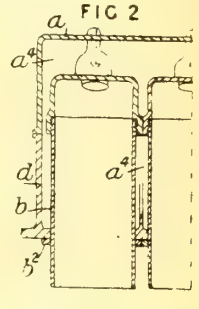
114,329. March 22nd, 1917. Lines, J. R. Propelling aeroplanes and seaplanes.
114,341. March 26th, 1917. Harris, F. Aircraft attack instrument for directing the fire of anti-aircraft guns.

Abridgements of recently published Specifications.

113,158. Internal-combustion Engines. Carter, S., 5, Vicarage Road, and Hawkins, R. E., 160, May Lane, both in Kings Heath, Alcester Lanes End, Birmingham.

Two-stroke-cycle Engines.—In an engine for aircraft, etc., having radial cylinders revolving about a stationary crank-shaft, each cylinder is provided with an inclined air-induction scoop 7 facing in the direction of rotation and communicating with air ports 10 in the cylinder wall near the inner end, and an exhaust outlet in each cylinder head is controlled by a valve 12 and communicates with an exhaust chamber 18 having a mouth opening in the opposite direction to that of rotation. Each piston 4 is provided with radial ribs having passages 44 extending from the periphery and opening inside the piston near the centre, so that, as the piston passes the air ports, air rushes through the passages 44 and out through the hollow crank-shaft 1, cooling the pistons and preventing accumulation of oil. In the form shown, eight cylinders are arranged in one plane, the connecting-rods 5 being pivoted to lugs $3\times$ on the big end of the master connecting-rod 3, but the cylinders may be arranged in pairs, fours, or other groups working on separate crank-pins, the groups being in planes arranged side by side.

Valve-gear.—The exhaust valves 12 are actuated from a stationary eccentric 20, which acts on valve rods 25, slidable radially in the rim of a disc valve 36 secured to the revolving crank-case, through ball-bearing rings 32, 33, the inner ring 32 being fixed to the eccentric. The valve rods 25 are connected to levers 26 each having a set-screw 31 bearing against the end of the valve stem 14.



Regulating.—The crank-shaft 1 is fixed to the part 22 of the engine frame by screws 42 working in slots in the sleeve 21 of the eccentric 20, so that the eccentric can be turned slightly to regulate the portion of the circle at which the exhaust valves open and close.

Valves; Cylinders, arrangement of ports in.—Liquid or gaseous fuel is supplied by the distributing-valve 36 and pipes 50 to diverging passages 53, 54, Fig. 3, in a boss 51 on each cylinder. The valve 36 rotates in contact with a disc 48 having an inlet pipe 47 and an arc-shaped recess 51^1, Fig. 7.

Igniting.—The magnetos 60, 61 are driven by spur-wheels 62, 63 gearing with a toothed ring on the valve 36, and the distributors 65, 66 are so arranged that each magneto supplies current to alternate cylinders, so that, in the event of the failure of one magneto, the cylinders which are working will be evenly distributed around the axis. The Provisional Specification states also that when the engine is stationary or employed for motor-vehicles, and rotates at a lower speed than for aircraft, the inlet scoops and exhaust outlets may each communicate with an annular chamber connected respectively with a fan and an air-pump, and the engine may be controlled by throttling the air-supply fan.

112,922. Internal-combustion Engines. Jouffret, H. V. J., 63, Boulevard des Batignolles, Paris. Aug. 2nd, 1917. No. 11142. Convention date, Jan. 26th. Not yet accepted. Abridged as open to inspection under Sect. 91 of the Act.

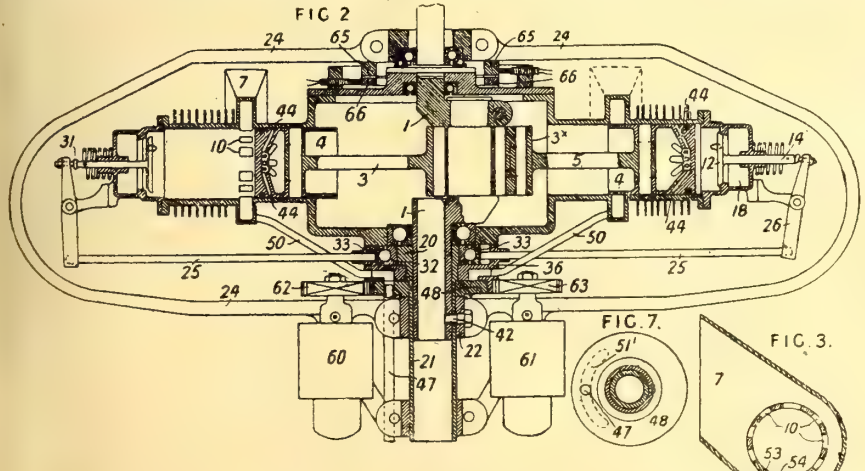
FIG 2

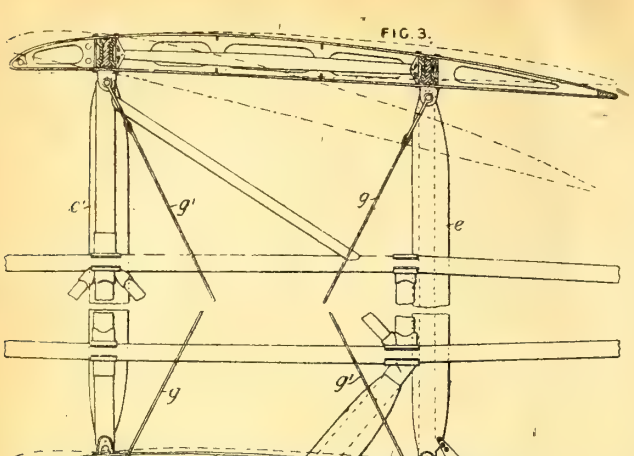
Cylinders and Valve-chests, Construction of and Cooling.—A water-jacket d is secured in position by the insertion of the cylinders b, which are screwed into the cylinder head a and have flanges b^2 engaging the bottom of the jacket. A part a^4 of the water-jacket may be formed in the cylinder head, and the flanges b^2 may be threaded on the cylinders for adjustment. The jacket d is preferably of aluminium, and the cylinders b of steel.

113,100. Aeronautics. Antoine, T., 16, Hammersmith Terrace, London.

Steering.—Aeroplanes having two or more supporting-planes adjustable about axes near their front edges, have the angle of incidence of the planes adjusted by diagonal tension members extending between the planes longitudinally of the machine and connected to pulleys mounted on rotary shafts carried by the planes. Figs. 3 and 4 show respectively a side view partly in section and an underneath plan of a biplane wing. The upper and lower planes are pivoted to front and rear struts c^1, e and are stayed by diagonal members g, g^1 of adjustable length. A pair of members g extends from the upper end of the rear spar to two pulleys i, i^1 on a shaft h supported by the front spar a^1 of the lower plane. The member g^1 passes around a pulley j carried by the lower plane and is attached to a pulley i^2 on the shaft h so that rotation of the shaft causes one diagonal to be shortened as the other is lengthened. The interplane struts are stayed transversely by the usual cross-bracing. The angle of incidence is changed by turning the shaft h through gearing

FIG 2





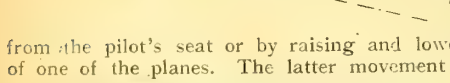


FIG. 7.

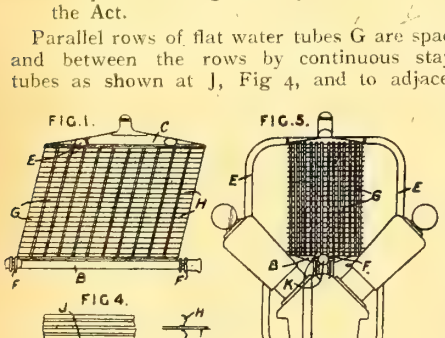
FIG. 3.



from the pilot's seat or by raising and lowering the rear spar of one of the planes. The latter movement may be effected by pivoted cams having peripheral flanges bearing against one or more rollers on the lower plane or on one of the struts *e*. In the case of multiplanes, the planes may be arranged one behind another at different levels and interconnected or one or more may be fixed and the remainder adjustable.

113,088. Radiators for Internal-combustion Engine. Soc. Lorraine des Anciens Etablissements de Dietrich & Cie de Luneville, 40, Rue du Colisée, Paris. Jan. 2nd, 1918. No. 118. Convention date, Jan. 27th, 1917. Not yet accepted. Abridged as open to inspection under Sect. 91 of the Act.

Parallel rows of flat water tubes G are spaced apart individually and between the rows by continuous stays H united to the tubes as shown at J, Fig 4, and to adjacent stays along their whole length by soldering, welding, or brazing. The assembled block is mounted between upper and lower collectors C, B, Fig. 1, the tubes extending into the collectors to give strength to the connection. The circulating-pump connects with a perforated tube K, Fig. 5, within the lower collector, and the upper collector is connected to the cylinder jacket by a tube E. The radiator may be mounted between the V-cylinders of an aeroplane engine as shown in Fig. 5, the pipe K in the lower collector being provided with attachment-lugs F, Fig. 1.

SALE OF FLAXSEED.

The following notice has been received from the Department of Agriculture and Technical Instruction for Ireland:—

The attention of flaxseed merchants is directed to their obligations under the Sale of Flaxseed (Ireland) Order, 1917, issued on December 14th, 1917, by the Ministry of Munitions. Under the provisions of this Order the price charged by a wholesale dealer to a retail dealer must not exceed the cost price to the wholesale dealer by more than 7/6 per bag of 182 lbs. together with actual charges for carriage and an allowance for such actual and necessary charges as may be approved by the Department.

The price charged by a retail dealer to a farmer should not exceed the actual cost price of such seed to the retail dealer by more than 10/- per bag of 182 lbs.

Retail dealers having sowing flaxseed for sale are required under the Order to display prominently on their premises a statement showing the price at which they are selling each lot of such seed.

Persons who contravene the Order are guilty of an offence under the Defence of the Realm Act.

NOTICE TO FLAXGROWERS.

The Department again warn farmers against the danger of sowing old flaxseed unless they have satisfied themselves that the termination is satisfactory.

Farmers would be only consulting their own interests in ascertaining the germination of their flaxseed before sowing it.

TIMBER: ITS IDENTIFICATION AND MECHANICAL PROPERTIES

On April 11th a meeting of the Aeronautical Society of Great Britain was held at the Royal Society of Arts Hall, when Mr. W. H. Barling, A.R.C.Sc., B.S.C., an associate fellow of the Aeronautical Society, read a paper entitled "Timber: Its Identification and Mechanical Properties."

Professor Percy Groom, D.Sc., Professor of Technology of Woods and Fibres at the Imperial College of Science, and Chief Timber Specialist at the Air Ministry, who is probably the greatest living authority on the subject, took the chair.

Mr. Barling gave an interesting discourse on timber from the point of view of an engineer rather than that of a botanist. He showed that the subject was one which demanded the closest study because, while the engineer was concerned with not more than a hundred metals, there were at least a 1,000 different kinds of wood in every-day use.

The engineer was handicapped in selecting and identifying timber because he handled it in the cut-up state, and had none of the botanist's aids, such as bark, leaves or buds from which to make conclusions.

The lecturer showed a large number of micro-slides which demonstrated the structure of the fibres of timber, and demonstrated how, with the aid of a low-powered microscope, the various timbers could be identified by their characteristic cellular structure, there being a providential arrangement which caused the almost endless varieties of timbers to differ from each other in one or other of the features in the structure of their trachieds, or annual rings, in their medullary rays and resin ducts.

Mr. Barling discussed the effects of the different soils in which timber of one species grew upon its density and other mechanical properties, and also the different qualities found in timber possessing various degrees of moisture.

He also discussed interesting phenomena found in the breaking stresses of timber put under load for short and long timber. For instance, 80 per cent. of the load which a beam would stand for a few minutes would be sufficient to break it if applied for a period, day and night.

The author thought that 50 per cent. of the load which a beam would stand if applied for the usual testing period (10 minutes) would cause it to collapse if applied for a sufficient time.

In concluding, Mr. Barling thanked the Superintendent of the Royal Aircraft Factory for his permission to use his lantern slides of timber sections, and paid a tribute to the work of Professor Groom, whose able lectures on the identification of timber formed an excellent foundation for later work.

It is interesting to note that Mr. Barling is associated in timber research with Mr. W. G. Tarrant, well known as the constructor of the Tarrant Huts, and as one whose ideas on timber structures for aircraft are both original and exceedingly practical.

The Discussion.

Professor Groom, in opening the discussion, laid emphasis upon the varying properties of timber, not only in the same species, but even in different parts of the same tree, and pointed out the consequent need for selecting timber for its quality as well as for its type.

He alluded to an interesting Indian timber which had a very strong elastic limit, which absolutely coincided with its breaking point, so that actually it was infinitely brittle.

He also pointed out that the properties of a timber could be varied according to the conditions, and particularly with relation to the rate of its growth.

He felt that investigation should be made into the powers of timber to resist shock.

Captain Benest read a letter from Colonel Linton Hope on the subject of the use of mahogany in yacht building, which showed that despite the enormous range of timbers to which this name was given, it had been found possible to procure a mahogany of uniform quality, for racing-boat building at any rate.

Mr. Griffiths, of the Royal Aircraft Factory, pointed out that timber stressed tortionally could be twisted to a greater extent without fracture over a longer period of time than was possible if the same degree of stress was applied during a shorter period.

Lieut.-Col. Ogilvie, R.A.F., who was asked to express his views, explained that he had really come to the lecture to learn. He felt that by the time we knew all that should be known concerning timber for aircraft it would no longer be employed.

Mr. Parnacott asked for study relating to glued joints. He thought that structures built up of plies of timber would be stronger than similar structures formed from a solid spar.

General Ruck thanked the Chairman for his attendance and said that the Air Ministry was to be congratulated upon having secured his services.

A Journal for Aircraft Manufacturers.

Aircraft Supplies, our Fortnightly House Journal, published on alternate Thursday evenings, contains a complete list of Stock of Aircraft Parts up to the time of going to press, Current Prices, Details of New Items, Enquiry Bureau, Charts and Tables of Various Parts, and Short Articles of interest to Aircraft Manufacturers. Copies of "Aircraft Supplies" will be sent FREE to the Air Services and to the Aircraft Industry (those in charge of Stores and other Works and Service Departments only). Applications should be made on business or official paper and should state nature of contracts.

MARKET TOPICS.

(Prices are for quantities on usual terms.)

April 10th, 1918.

COPPER.—The demand for Copper both here and in U.S.A. continues to increase; it is, however, gratifying to learn that the output has considerably improved recently.

Although there have been one or two complaints of supplies not being satisfactory, the position generally does not give any cause for anxiety. In fact the outlook is quite good.

There is still a keen agitation in U.S.A., particularly among small producers, for an increase in price, and if no alteration is made immediately, it is practically certain that an advance will be given after July 1st.

TIN.—The position of this market is still unsatisfactory, although there has been a little improvement recently, due to large quantities of Tin having recently arrived.

The Metal Exchange Licensing Committee are exercising a very close control on available supplies, and it is not easy to obtain a permit unless it can be proved that the metal is actually required to fill a contract which has actually been placed.

The situation generally is easier than it was a fortnight ago, and the outlook is brighter. It is hoped that there will be a relaxation of restrictions shortly.

Prices in London are £10 lower than the prices ruling in the East, and large quantities of East Tin are being brought by U.S.A., the position there being very serious indeed. Prices here have been fairly steady recently, and it is not expected that there will be any violent fluctuations during the next few weeks.

COMPARATIVE PRICES.

To-day, 8th	£318 0 0
April 4th	£316 0 0
Last month	£319 0 0
Last year	£216 0 0

LEAD.—There has not been any alteration in prices, and supplies are fairly satisfactory.

STEEL.—While the demand for Aircraft Steels continues to increase, the mills appear to be meeting the demands made upon them satisfactorily, and there does not appear to be much difficulty in obtaining supplies.

It is also expected that there will be ample supplies of High Speed and Cast Steel available in a few weeks, firms in U.S.A having signified their willingness to make all the Tool Steel they will require. It is therefore expected that exports to U.S.A. will be prohibited. There should, therefore, be a corresponding increase in the supplies available for home consumption.

The discontinuance of shipments of High Speed, Carbon, and ordinary Steels to Russia will also have a similar effect on supplies. In fact, in some quarters a slump is expected. It is well known that there is about 1,000 tons of High Speed and Carbon Steels lying in various British ports, which was originally consigned to Russia.

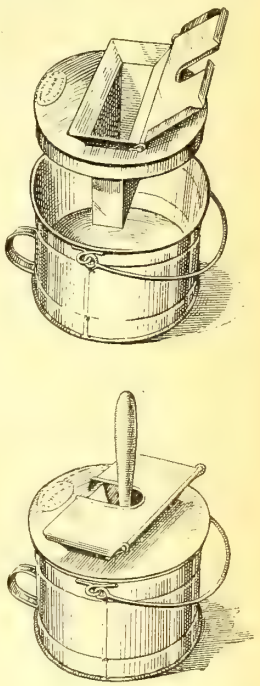
Prices continue unchanged.

TIMBER.—The question of Timber supplies is causing grave anxiety; the huge demand can hardly be satisfied with the small shipments which have recently been received. In fact, it is reported that some factories have been in considerable difficulties recently owing to shortage of Silver Spruce. The situation demands an official enquiry.

It is now evident that although the Air Board knew that there were three or four substitutes which were quite as good as, if not better than, the substitute officially approved, they put all their eggs in one basket and banked on the latter. The material does not appear to be giving anything like satisfactory results, and recent reports indicate that the situation is worse now than it ever has been. The outlook is very black indeed with very little hope of improvement.

The Plywood situation continues to improve.

Mahogany and Walnut supplies are fairly satisfactory.



Prices are very firm.

FABRIC.—Supplies are quite satisfactory at present. It is understood that the authorities are arranging for a coarser Linen Fabric to be supplied with the object of conserving the stock of yarns. There does not appear to be any reason why this should not have been done over 12 months ago.

The policy of Government Departments appears to be "wait for a crisis then devise means of getting over it." At least this is what has happened in the case of Fabric, Timber, Dope, etc.

A PRACTICAL DOPE CAN.

Considerable difficulty has been experienced in the practical use of aeroplane dope, owing to the volatile nature of the chemicals from which it is formed, and a good deal of wastage results through evaporation from the pots which the operatives use when applying it. It is also affected by the dust which it readily collects

Various ingenious devices have been produced to handle dope in an economical fashion, and at the same time to render its application easy and unobstructed, and a very successful effort has been made by Arthur Hill & Co., Sheet Metal Works, Silchester Road, W.10, who have evolved the dope can illustrated. It will be seen that it consists of a simple pot fitted with a lid which slides on easily without any mechanical fastening.

From the centre of the lid a well descends and almost touches the bottom of the pot when in place. Thus all the dope in the pot is excluded from the air, except the surface of the small portion trapped by the well, and evaporation even at this opening is reduced to a minimum during temporary stoppage of work by the fitting of a fall-down lid

The apparatus is patented, and the proprietors will be pleased to quote for large and small quantities.

MACHINE SHOP ACCESSORIES.

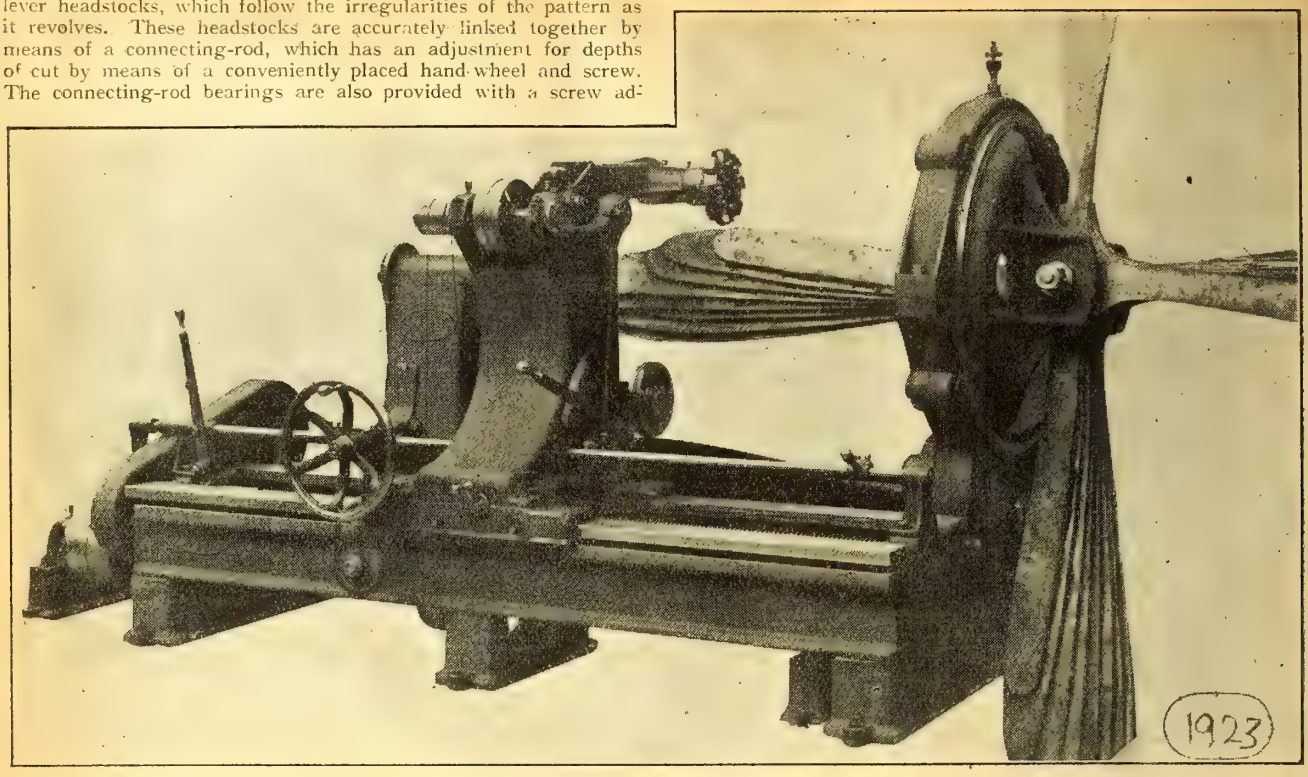
James W. Carr & Co., Ltd., of 35, Queen Victoria Street, E.C.4., who specialise in the supply of machine tools and other hardware, have issued an interesting brochure concerning machine shop accessories and invite those interested to apply for a copy.

A DISCLAIMER.

Mr. F. A. Dolman, of 2, Stag Lane, Edgware, wishes it to be known that he is not in any way connected with the Camden Construction Company.

AN AUTOMATIC AIRSCREW-SHAPING MACHINE.

A very interesting airscrew-shaping machine has recently been introduced by the well-known firm of J. Sagar and Co., Ltd., of Halifax. This has been specially designed for shaping airscrews with two or four blades.



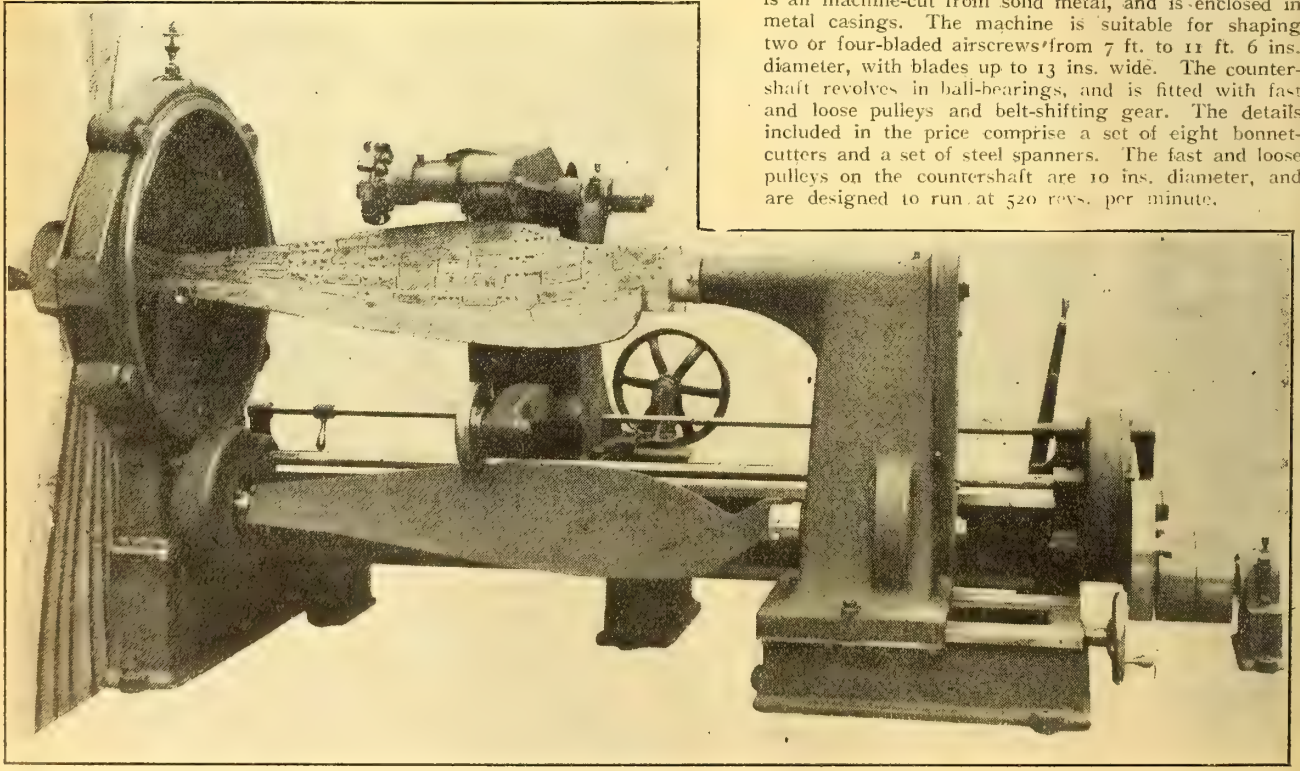
The main frame of the machine consists of a heavy bed mounted on suitable standards, and carrying the traversing cutterhead and former carriage, and the double headstocks which hold the screw to be shaped, and the metal pattern or template.

The revolving disc headstock which carries the airscrew to be shaped is driven by machine-cut gearing, and its revolutions are correctly synchronised with the spindle carrying the tip of the blade, and also with the spindles carrying the metal pattern or template, the necessary accuracy being obtained by means of machine-cut gearing, and silent chain-driving between the various spindles. The airscrew is firmly held by means of a suitable cramping device fitted to the revolving disc headstock.

The loose headstock spindle is provided with self-centring cramping jaws to hold firmly the top of the airscrew blade whilst being shaped, which effectively eliminates any possibility of end-thrust or buckling action. This is an important feature, and has a great deal to do with the smooth finish and necessary accuracy which is required in shaping the blades, especially the more slender portions.

The cutterhead and former spindles are mounted in rocking

lever headstocks, which follow the irregularities of the pattern as it revolves. These headstocks are accurately linked together by means of a connecting-rod, which has an adjustment for depths of cut by means of a conveniently placed hand-wheel and screw. The connecting-rod bearings are also provided with a screw adjustment for taking up wear or end-play, so that any vibration can be eliminated between the cutter head and the former.



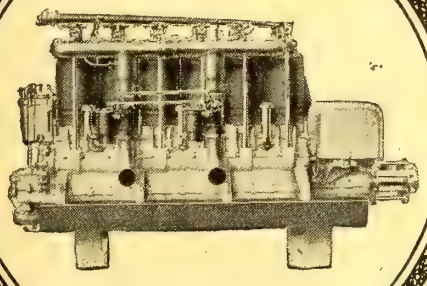
Blade-front View of the Sagar Airscrew Shaper.

This particular adjustment is specially mentioned, as it is altogether different from that generally used on an ordinary copying machine. Each spindle is made of high carbon steel, and revolves in roller or ball bearings. Screw adjustments are provided for regulating different depths of cut and a convenient hand-lever arrangement is fitted, instantly putting in or out of action the cutterhead and former.

The cutterhead is fitted with eight bonnet-cutters formed from solid steel, and carefully shaped and ground so as to fit accurately the seatings in the cutterhead.

The traversing headstock carrying the cutterhead and former spindles travels automatically along the bed by means of a screw, and can be stopped in any position by moving a conveniently placed hand-lever, or by releasing the grip nut in which the traversing screw works. A hand-wheel motion actuating a pinion and rack fixed to the bed is provided so that the traversing headstock can be moved quickly along the bed when it is returned to the starting position after the shaping of the blade is completed. Each blade is shaped by one traverse of the headstock, suitable stops being provided for arresting automatically the traverse at the end of each operation.

The feeding mechanism is arranged to give a feed of $\frac{1}{2}$-in. per rev. of the work, or 3 in. and 6 in. per minute of travel along the bed, so that the blade of a medium-sized airscrew can be completely shaped in 10 to 15 minutes. The gearing is all machine-cut from solid metal, and is enclosed in metal casings. The machine is suitable for shaping two or four-bladed airscrews from 7 ft. to 11 ft. 6 ins. diameter, with blades up to 13 ins. wide. The countershaft revolves in ball-bearings, and is fitted with fast and loose pulleys and belt-shifting gear. The details included in the price comprise a set of eight bonnet-cutters and a set of steel spanners. The fast and loose pulleys on the countershaft are 10 ins. diameter, and are designed to run at 520 revs. per minute.



Blade-back View of the Sagar Airscrew Shaper.

CURRENT TOPICS.

A SCANDINAVIAN AERIAL TRANSPORT CO.

Transport through the air is bound to become the recognised method of general, rapid travelling, and one does not need to be a prophet to forecast the formation, sooner or later, of companies in every part of the world to exploit aerial conveyances.

It will certainly occupy the attention of all the astutest financiers—British, French, American, and Italian—immediately we are once again permitted to forget the war. In the meantime the pace is started by a neutral country.

The Norwegian Air Route Company.

This Company, which has a capital already subscribed of 3,000,000 krona in shares of 1,000 krona each, representing in normal exchange a capitalisation of about £165,000 in shares of about £55 each, has been formed to inaugurate and carry on a regular mail and passenger service between Aberdeen and Stavanger. Arrangements are contemplated for extending the service from Stavanger to Christiania via Christianssand, and also by similar route to Copenhagen and Bergen.

The Time Table.

Already a time table giving days and hours of departure and arrival has been prepared and one may expect very shortly to see the addition of a section, devoted to aerial transport, in our Bradshaw and A.B.C. books of reference. It is stated that the passage across the North Sea will be covered in less than five hours, and it is said that a regular service will begin next month between Skaw and Copenhagen

British Sympathy.

The Director of the Seaplane Department of the Royal Norwegian Navy (Captain Dehli) has accepted the position of Technical Adviser to the new company, and is at present in London negotiating with our Government for sympathetic reception of the project. Naturally, in the present moment, all kinds of safeguards to our national security will require to be imposed, but the scheme is a step in the right direction, and as such merits our most benevolent consideration and reciprocity.

AIRCRAFT.

Aviation is fast becoming the favourite pivot on which to rotate all kinds of ingenious attempts to gain some pecuniary advantage. Out of the gullible public, by the many anxious to secure a foothold in the industry, and out of the State by some already established. It is "Air Craft" writ in two syllables with the latter strongly accentuated.

Revelations.

The subject ranges from the tricks and subterfuges to evade the excess profits duties and taxes to the persiflage connected with covert invitations to subscribe for shares in companies unable to secure Treasury consent for an issue. Perhaps the most up-to-date method is the "report" (*sic*) of the directors who conveniently "camouflage" the position by the statement that they "regret being unable to publish any accounts in consequence of the outstanding questions relating to excess profits duty and taxation." The multiplicity of detail and the mass of information under this head prevent it being dealt with adequately in one article. It will therefore appear in these columns, under this heading, from time to time, as space permits.

A Glaring Anomaly.

How the Registration Officials are openly hoodwinked and the whole of the laborious enactments of the Companies Acts set at defiance is of sufficient importance to form the first subject for presentation.

A company was formed with the nominal capital of £10,000, divided into shares of £1 each, and the registration fees of 5s. per One hundred pounds (£25) duly paid. Thereupon a meeting was duly convened and the shares were at once split up into 200,000 shares of 1s. each and concurrently the Directors, by simple resolution, Resolved that no shares be issued at less than 10s. per share. All perfectly legal and in conformity with the Acts passed and approved by the Solicitors of the company.

If one will examine the effect it will be seen that the capital of the company by this method really consists of 200,000 shares of 10s. each, equal £100,000 upon which should have been paid fees amounting to £250.

In this way the Treasury is defrauded openly of no less than £225, notwithstanding all the elaborate machinery of the Consolidated Companies Acts. This is not an imaginative case, as the company actually exists, and the directors, one of whom is a peer, are vastly proud of the fact that they have "saved" their company such a large amount of unnecessary expense.

Immediate Treasury Action Wanted.

The name of the company and other particulars are at the disposal of the company officials and the Treasury. Steps must be taken at once to put a stop to so glaring a breach in the construction of the Act, not only to prevent a repetition, but for the more important reason that it is an open doorway for the perpetration of fraud upon shareholders.—G. A.

THE BRITISH IGNITION APPARATUS ASSOCIATION.

At a recent meeting of the Edinburgh Rotary Club an address was given on the remarkable development of the British Magneto Industry by Mr. Peter F. Bennett (of Thomson-Bennett Magnetos Ltd., Birmingham), chairman of the British Ignition Apparatus Association. He explained that at the outbreak of war Britain was dependent on Germany and America for practically all the raw material used in the magneto. Now, however, the manufacturers were producing better magnetos than the Germans.

He said that Government departments had become alive to the situation and by co-operation the manufacturers had been able to make enormous developments which he hoped would enable them to compete successfully with all rivals after the war. The capital invested in the British Magneto Industry was approximately one million pounds, and it gave employment to 5,000 people—not including those engaged in subsidiary trades.

When the day of reconstruction came British magnetos would not be found wanting. At any rate, the theory of Bosch infallibility had been absolutely exploded. A cordial vote of thanks was recorded to Mr. Bennett on the motion of Mr. J. Albert Thomson.

COMPANIES ANNOUNCEMENTS.

NEW COMPANIES

The files of the following new companies are available for inspection at Somerset House.

Aeronautical Engineering Co., Limited.—Private Company. Registered March 27th. Capital £20,000 in £1 shares. Electrical, general and mechanical engineers, cabinet makers and furniture manufacturers; manufacturers, repairers and letters on hire of and dealers in aeroplanes, aeroplane engines, parts and accessories, etc. The subscribers (each with one share) are: F. H. H. Samuel, 31/34, Basinghall Street, E.C.2., solicitor; Theo. McKenna, 31/34, Basinghall Street, E.C.2, solicitor. The first directors are to be appointed by the subscribers. Solicitors: McKenna & Co., 31/34, Basinghall Street, E.C.2.

Alwin Engineering Co., Ltd.—Private Company. Registered March 25th. Capital £1,000 in £1 shares. To take over the business of an aviation and general engineer, etc., carried on at 8, Luther Road, Teddington, as the Alwin Engineering Co. The subscribers (each with one share are):—A. E. Cartlidge, 8, Luther Road, Teddington, engineer; Mrs. E. F. Cartlidge, 8, Luther Road, Teddington. The first directors are: A. E. Cartlidge and E. Griffin. Qualification, £100. Registered office: 8, Luther Road, Teddington.

Brentford Aircraft, Ltd.—Registered April 2nd, 1918. Capital, £10,000 in £1 shares. Registered office: Market Place, Brentford, Middlesex.

Co-operative Gauge and Precision Toolmakers Association.—Registered Jan. 18th, 1918. Gauges for aircraft and submarine work, tools, small parts for naval guns, etc. 56, Myddleton Street, E.C.1. Partners (1) Hubert Elkerbout (Dutch), 23, Myddleton Square, E.C.1; (2) T. Broeder (Dutch), 27, St. Martin's Avenue, East Ham, E.6.

North Finchley Motors and Metals, Ltd.—Registered March 26th, 1918. Capital, £5,000 in £1 shares. Registered office: 15, Woodbourne Parade, North Finchley, N.12.

Thames Engineering and Aircraft Co., Ltd.—Registered April 10th. Capital, £20,000 in 10,000 10 per cent non-cumulative preference shares of £1 each and 40,000 deferred shares of 5s. each. To carry on the business of manufacturers, constructors and designers of, contractors for, and dealers in

aeroplanes, airships, aircraft of all kinds, automobiles, motor-cars, cycles, vehicles, boats and vessels, dynamos, engines, and parts, etc. The subscribers (each with one share) are:—F. C. March, 34, Victoria Street, S.W. (consulting engineer); H. March, 34, Victoria Street, S.W. (civil engineer); I. Smith, Colonial Buildings, Halifax (wool merchant); E. de Marney, 34, Victoria Street, S.W. (company secretary); M. K. Parsons, 265, Bath Road, Hounslow (clerk); N. W. Perrott, 66, Victoria Street, S.W. (engineer); J. J. Morgan, 34, Victoria Street, S.W. (engineer). Minimum cash subscription: 3 preference shares. The first directors are:—F. C. March, J. C. Staton and C. H. St. J. Cooper. Registered office: Point Pleasant Wharf, Wandsworth, S.W.

MORTGAGES AND CHARGES.

Handley Page, Ltd.—Debenture dated Feb. 4th, 1918, to secure £100,000 charged on the Company's undertaking and property, present and future, including uncalled capital. Holders: London, Provincial and South Western Bank.

Cowper-Coles Aircraft Co., Ltd.—Debenture dated Jan. 28th, 1918, to secure £10,000 charged on the Company's undertaking and property, present and future, including uncalled capital. Holders: London, Provincial and South Western Bank, Fenchurch Street, E.C.

Aircraft Manufacturing Co., Ltd.—Mortgage registered March 28th, 1918, for £4,000.

Norman Thompson Flight Co., Ltd.—Particulars of £15,000 debentures created April 4th, 1918, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The Company's undertaking and property, present and future, including uncalled capital, subject to prior debentures. No trustees

SATISFACTION.

Grahame-White Aviation Co., Ltd.—Satisfaction filed March 27th, 1918, of £80,000 registered December 19th, 1917.

DIVIDEND DECLARATIONS.

A. Darracq & Co., Ltd. (1905).—An interim dividend of 5 per cent. (less income tax) has been declared on the ordinary shares, payable April 30th, 1918.

Charron, Ltd.—An interim dividend at the rate of 7 per cent. per annum (less income tax) has been declared on the preference shares in respect of the three months ended March 31st.

Armstrong, Whitworth & Co., Ltd.—The Directors announce that in view of the impossibility of completing the 1917 accounts for some time in consequence of existing circumstances they have decided to pay a dividend of 1s. 6d. per share, free of income tax, on the ordinary shares of the company, 4 per cent. per annum on the first preference shares, and 5 per cent. on the second preference shares (both less income tax).

Electrical Utilities Corporation (New York).—A quarterly dividend (No. 32) of 1¼ per cent. on the prepared stock has been declared payable April 15th for the quarter ending March 31st, 1918.

Vickers, Ltd.—A final dividend for 1917 of 1s. 6d. per share on the ordinary shares has been declared. This makes, with the dividend already paid, 12½ per cent. (tax free) for the year being the same as for 1916. The present dividend declared is payable May 10th.

Vauxhall Motors.—The Directors' report for 1917 has just been issued. It is proposed to pay a final dividend of 1s. 3d. per share (less tax) making 10 per cent. for the year. The Directors state that they regret their inability to submit the accounts owing to the delays in settling the amount of excess profits duty and special taxation payable by the company. The shareholders' meeting is convened to be held at Winchester House on the 19th inst.

THE TRUTH AND NOTHING BUT THE TRUTH.

The following, which appeared in "John Bull" on April 13th, is an excellent example of the typical Englishman's dislike for hearing or reading the truth about himself:—

To Charles G. Grey, Esq., Editor "The Aeroplane."

Dear Sir,—Some of the splendid fellows of the R.A.F., whom you so vulgarly traduce in your columns, are furious with you. And I am not surprised. "We have," you say, "a great deal too much limelight on our aviation," and you do your best to belittle their wonderful services. "If one has to go and make war one can imagine no more delightful way of doing it that by going out to be killed for a few hours a day, and spending the rest of the time in comfortable huts, replete with all the comforts of home, from tablecloths to Kirchner pictures." Do you know the average life of an airman at the Front? Why don't *you* go and make war in this "delightful way"; and spare us your pretty wit? There's still room for men of your age! John Bull.

[To paraphrase a popular quotation. "Abuse from Mr. Bottomley is praise indeed." Some people have no sense of proportion, and others no sense of any kind.

This paragraph is inserted on the "Finance" page because it is the only portion of the paper which Mr. Bottomley is likely to understand.—Ed.]

AEROPLANE GENERAL SUNDRIES, LTD.

The following letter has reference to the recent litigation between the A.G.S. Manufacturing Co., Ltd., and Aeroplane General Sundries, Ltd.:—

Sir,—I presume you will be publishing in your next issue a report of the recent appeal brought by this Company in the Court of Appeal in the case of the A.G.S. Manufacturing Co., Ltd., v. the Aeroplane General Sundries, Ltd. An injunction was granted against the latter Company to restrain it "from representing by advertisement or otherwise that the letters A.G.S. stand for or are another name for 'Aeroplane General Sundries, Limited.'"

It was suggested that I had intended to confuse it with the A.G.S. Manufacturing Co., Ltd. It will not be necessary for me to assure the many friends I have in the Aircraft Industry that nothing has been further from my intention. The trouble arose in the first instance through a statement made in one of my earlier advertisements. This statement was made in perfectly good faith. Immediately the point was raised the advertisement was discontinued, and I have always done my best to give prominence to the full name and address of my Company, and I fail to see how any possible misunderstanding could arise.

The Appeal Court has now seen fit to confirm the decision of Mr. Justice Neville, and I should therefore be very grateful if you would allow me to emphasise through the medium of your journal that Aeroplane General Sundries, Ltd., is a Company founded by me, to manufacture and deal in A.G.S. parts, and has no connection with any other firm or company.

In a serious national crisis like the present, every woman is bound to do her utmost to serve her country, and it is my sole ambition to be of real service to the aircraft industry in which I have always taken a real interest. I hope that in spite of this unfavourable, legal decision or even because of it, I may rely on the continued and increased support of all who are assisting in the production of the aeroplanes on which the safety of our country depends.

Thanking you, in anticipation of your courtesy,

(Signed) For Aeroplane General Sundries, Ltd.

D. M. Nicholson (Managing Director).

[Thus it is made clear that Aeroplane General Sundries, Ltd., has a right to use its name in full, but not its initials alone.—Ed.]

(*Continued from page* 1418B).

Later in the day, when there was a slight improvement in the weather, our machines reconnoitred the new battle front between La Bassée and Armentières, and bombed and engaged with machine-gun fire the enemy's attacking troops.

Hostile low-flying machines were also active on this sector. Four of these machines were brought down by our aeroplanes, and one was shot down by our infantry.

Two of our aeroplanes are missing.

April 11th, 8.30 p.m.—The weather on the 10th inst. was most unfavourable for flying, but as soon as it was possible to leave the ground our aeroplanes went out to reconnoitre the battle front. Useful information was brought back as to the position of the enemy's troops, which were attacked with bombs and machine-gun fire on every suitable occasion.

Owing to the mist our pilots were compelled to fly at an average height of 200 ft. in order to obtain any information, and experienced very heavy fire from the ground.

The enemy's low-flying machines were also active on this front. Three hostile machines were shot down in our lines by our infantry, and four others brought down by our aeroplanes. One German machine was driven down out of control.

Seven of our machines are missing.

At midday on the 11th inst. a raid was carried out by us against Luxemburg railway station. Over a ton of bombs were dropped, and several bursts were seen on the railway and around the station. The enemy's anti-aircraft gunfire was considerable.

All our machines returned.

April 12th, 7.59 p.m.—The mist which has prevailed during the last few days continued till late in the afternoon of the 11th inst., when the weather gradually began to clear. While the mist lasted aerial activity was confined to the battle front north of La Bassée Canal, where our aeroplanes reconnoitred the line at a very low height and dropped bombs and fired their machine-guns at the enemy troops in the open.

When the mist cleared there was great activity in the air along the whole front. Several long-distance reconnaissances were carried out; many photographs were taken, and much fighting took place.

Twenty-one hostile machines were brought down, and 14 others were driven down out of control.

Four of our machines are missing. Two of our aeroplanes reported yesterday as missing have since returned.

During the night over eight tons of bombs were dropped on Bapaume, on villages south of the Somme, and on military objectives at Ostend and Zeebrugge.

One of our machines has not returned.

On the 12th inst. the Sablon railway station at Metz was successfully bombed. Twenty-two heavy bombs were dropped, all of which burst on the railway and the sidings.

All our machines returned.

April 13th, 8.50 p.m.—On the 12th inst. atmospheric conditions were favourable for flying, and a great concentration of our aeroplanes was effected by us on the battle-front

Large numbers of low-flying machines were employed in bombing and sweeping with machine-gun fire roads packed with the enemy's troops. Thirty-six tons of bombs were dropped and over 110,000 rounds of ammunition were fired by us

While these attacks on ground targets were in progress, other formations, flying at a greater height, engaged the enemy's aeroplanes, which were extremely active in this sector. Other machines reconnoitred the battle area, bringing back information as to the positions of our own and the enemy's troops.

On the remainder of the British front the usual work in co-operation with our artillery was carried out, and a very large number of photographs were taken.

In air fighting 40 German machines were brought down by our aeroplanes, and 20 other hostile aeroplanes were driven down out of control. In addition, two of the enemy's machines were shot down by anti-aircraft gun-fire. Three hostile observation balloons were also destroyed.

Twelve of our aeroplanes are missing.

After dark, the incessant bombing carried out by us during the previous 12 hours was continued until dawn. Over 22 tons of bombs were dropped on different targets, including the Don and Douai railway stations, two important railway junctions between Mézières and Reims, and roads leading up to the battle-front in the neighbourhood of Estaires.

April 14th, 8 p.m.—On the 13th inst. clouds and mist prevented fighting except at a low height from the ground. Our low-flying machines reconnoitred the battle-front throughout the day, and dropped over 1,200 bombs on the enemy's troops on roads leading to the front.

Only a few fights took place, and results were indecisive.

One of our machines is missing.

April 15th, 8 p.m.—On the 14th inst. our aeroplanes reconnoitred the enemy's lines on the Lys battle front, and were again obliged by clouds and mist to carry out their work at a very low height. Bombs were dropped and machine-gun fire was opened from the air on the enemy's troops in this area.

All our machines returned.

War Office Communiqués.

The G.O.C. Macedonia reports:—

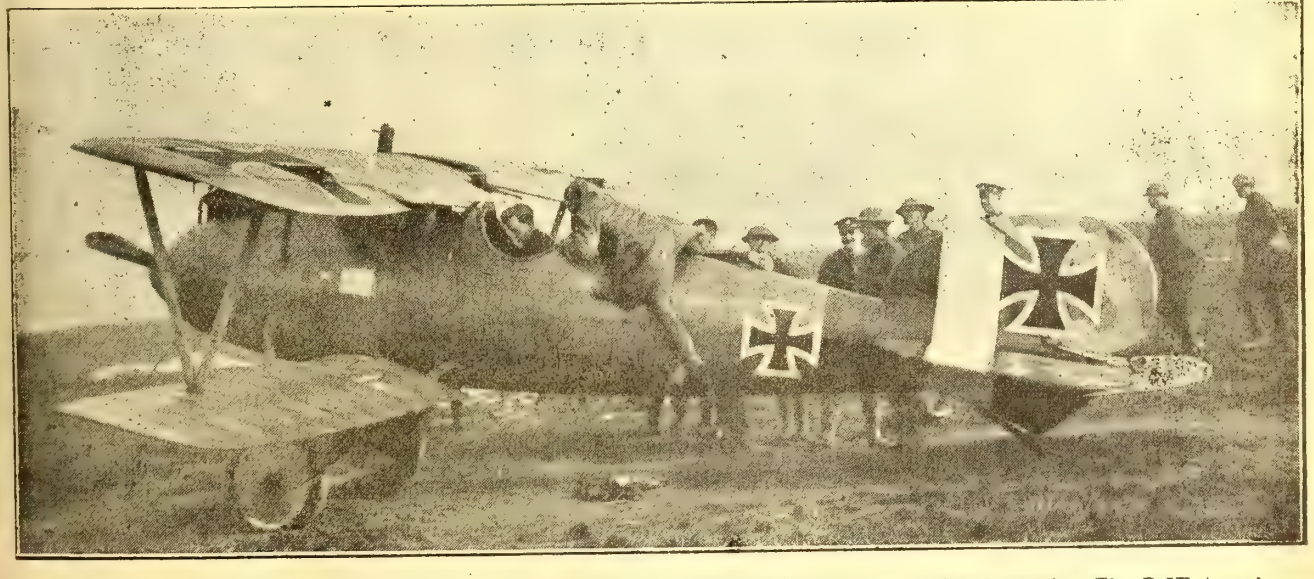
April 13th.—On April 4th the Royal Flying Corps bombed Angista (Dedeagatch Railway) station and caused considerable damage to the railway lines. On their return our machines brought down a hostile aeroplane in the neighbourhood of Orfano.

On April 6th our aeroplanes co-operated against the enemy's gun emplacements and infantry.

On the evening of April 11th our aeroplanes bombed Porna station (Dedeagatch Railway). All the bombs dropped were observed to burst in or near the station buildings.

The G.O.C. Italy reports:—

April 14th.—The weather has been consistently bad, and little flying has been possible. On the few occasions the R.A.F. has been able to go out, three enemy machines have been destroyed, and two driven down out of control without loss to ourselves.



Home Command Communiqués.

April 12th, 11.50 p.m.—Some hostile airships crossed our East coast this evening, and proceeded to attack certain Eastern and Midland districts.

One or two of the raiders succeeded in penetrating farther inland, where some bombs are reported to have fallen. Further details are not yet available.

The raid is still in progress.

April 13th, 12.15 p.m.—Four airships participated in last night's raid. Two of them penetrated a few miles inland. Of the other two, one reached the Midlands, and the other nearly

A D.IV TYPE ALBATROS.—A British flying officer inspecting the internal economy of a captured sample. The D.IV type is fitted with a 260-h.p. Mercédès engine, as against the 160-h.p. of the D.III type.

reached the North-West Coast The raiders were travelling at a great height, and showed no inclination to attempt to penetrate defended areas. Most of the bombs were dropped in the open country, and apart from the demolition of four houses at one place the damage so far reported is inconsiderable.

A later communiqué announced that the casualties were as follows :—

Killed.—2 men, 2 women, 1 child; total 5.
Injured.—8 men, 6 women, 1 child; total, 15

THE CASUALTY LIST.

MILITARY.

Reported April 10th.

KILLED.—Driver, Lt. P. S., A.S.C., attd. R.F.C.; Fitzgibbon, Sec. Lt. H., R.F.C.; Ramsay, Sec. Lt. W. J., R. Welsh Fus., attd. R.F.C.; Turnell, Sec. Lt. R.D., R.F.C.

MISSING.

APRIL 4th, R.F.C.—Swain, 75078, Serjt. F. J. (Wokingham).

APRIL 5th, R.F.C.—Guyat, 36287, 2nd Cl. Air Mech. J. G. (Kensington, W.).

PERSONAL NOTICES.

NAVAL.

DEATH.

GILLETT.—Flt. Sub-Lt. Howard Raymond Gillett, R.N., who was killed whilst flying in Kent on March 6th, was the only child of Mr. and Mrs. Raymond Gillett, 101, Broadhurst Gardens, N.W.6. He was 18 years of age.

ENGAGEMENT.

HOLMAN—BROWN.—An engagement is announced between Surgeon Alec George Holman, R.N., attd. R.A.F., of Westbury-on-Trym, Bristol, and Grace Kathleen, fifth and youngest daughter of the late Charles N. Brown and Mrs. Brown, of The Elms, South Town, Great Yarmouth.

BIRTH.

BUSH.—On Easter Day, at a Nursing Home, Brockley, to Hilda Madeline, the wife of the Reverend S. G. Bush, R.N., attd. R.N.A.S.—a son.

MILITARY.

DEATHS.

CUNNINGHAM.—Sec. Lt. F. J. Cunningham, 1st Canadian Contingent and R.F.C., died on April 6th at Westdene, Earley, Reading, the home of his parents, from illness contracted on active service. He was 29 years of age.

DILLON.—Sec. Lt. E. J. Dillon, Gen. List and R.F.C., was killed in a flying accident in Norfolk on April 12th.

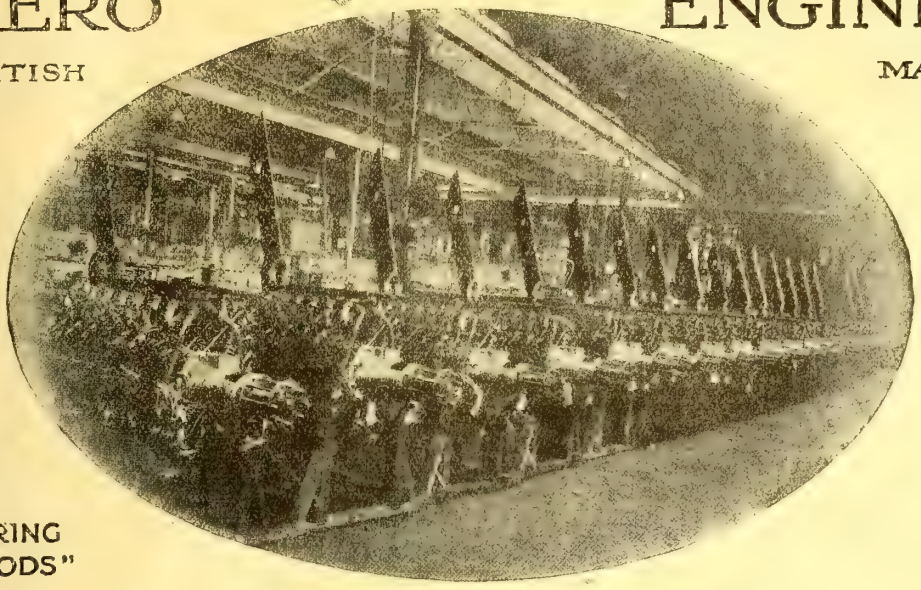
Edward Joseph Dillon was the son of Mr. and Mrs. J. T. Dillon, of 149, Walm Lane, Cricklewood, N.W. He was born on Feb. 11th, 1895, and was educated at St. Edmund's School, where he was a good all-round sportsman.

He took a keen interest in aviation in the early days, and was a regular habitué of Hendon, where he assisted as a voluntary helper at race meetings, and there experienced his first flights as passenger.

He enlisted at the outbreak of war in the Royal Army Medical Corps, and served in the field in France and Greece for over two years, during which period he displayed great gallantry, and was awarded the Military Medal for taking wounded men to the rear under circumstances of difficulty and danger.

In the early summer of 1917 he was sent from Macedonia to England for transfer to the Royal Flying Corps, and proved himself an exceptionally able pilot, graduating to fast fighting scouts without a single breakage.

He had a quiet and lovable disposition, a strongly developed sense of humour, and was endowed with that natural modesty which is proper to true bravery. His untimely death has robbed the country of a pilot who would have done fine work.



In this issue will be found an obituary notice concerning Sec. Lt. Wansey Smith, a Hendon comrade of Mr. Dillon's, who was recently killed flying on active service in France.

GAISFORD.—Capt. Robert Sandeman Gaisford, R.F.A., attd. R.F.C., is now officially reported killed in action on January 30th. He was 22 years of age, and younger son of Lt.-Col. D. J. Gaisford, of Dolly's Grove, Dunboyne, County

Meath. He had his captaincy in the Royal Artillery in January of this year, and he received his "wings" in August, 1917.

GREENALL.—Capt. Jack Eckersley Greenall, Yeo., attd. R.F.C., who was killed in action on March 31st, was 28 years of age and eldest surviving son of Mr. and Mrs. Henry Greenall, of The Elms, Moore, Warrington.

FINNIMORE.—Sec. Lt. H. J. Finnimore, R. Sussex Regt., attd. R.F.C., who died of wounds on March 27th, was the second son of Mr. and Mrs. J. A. Finnimore, 83, Park Road, Plumstead, S.E. He was 21 years of age.

LEDGER.—Sec. Lt. Harold Partington Ledger, R.F.C., eldest son of Mr. and Mrs. A. W. Ledger, of Canterbury, was killed in action on Nov. 20th, 1917, near Cambrai. He led his flight over the German lines at a low altitude, and immediately encountered a dense mist. Information received from the Geneva Red Cross states that he was shot through the heart. Mr. Ledger was educated at the Simon Langton School, Canterbury, and Christ's Hospital, West Horsham, 1907-1911. He joined the U.P.S. 18th Royal Fusiliers Batt. in April, 1915, and proceeded to France in Nov., 1915, and on his return after a cadet course at Oxford was gazetted to the R.F.C. in Sept., 1916. Mr. Ledger was 23 years of age.

STACEY.—Lt. John Randolph Stacey, Canadian Army, attd. R.F.C., who was killed in a flying accident at Hounslow on April 8th, was a "chief" of the Iroquois Indians and of five other North American tribes. He came to England with the Canadian Force, and gave promise that he would become a very able and skilful aviator.

At the inquest, held on April 10th, a verdict of "Accidental death" was returned. It was stated that he attempted to rise in a new machine before the tail left the ground, and afterwards crashed down.

SMITH.—Sec. Lt. Wansey Smith, East Lancs., attd. R.F.C., who was killed in action on April 2nd, was the only son of Mr. and Mrs. Wansey Smith, of 71, Queen's Avenue, Finchley, N. He was 26 years of age.

Mr. Wansey Smith enlisted in 1914 and went to France as an Army Cyclist in 1916. His gallantry in action and general ability won him a commission in the East Lancs. Regiment in 1917. On his return to England he joined the R.F.C., being seconded for duty as an observer. While in France as an infantry officer he had the unusual distinction of bringing down a low-flying German aeroplane with a rifle.

Old-timers at Hendon will remember Mr. Wansey Smith as a most ardent follower of aeronautical affairs. He was a regular habitué of the aerodrome, and gave his help freely wherever he could be useful as an amateur mechanic or propeller-swinger. Many of us regret that so promising a soldier should have gone out before having further chance for distinction in the aerial work with which he had so long been concerned.

His commanding officer writes: "He was doing a trench patrol at low level, when the machine was heavily fired at from the ground by enemy machine guns. From all evidence, it would appear that the pilot was hit and fainted, and falling on his controls, the machine dived steeply into the ground within our lines, being totally wrecked, and both occupants killed at once."

SWAINE.—Lt. Sidney W. Swaine, R.A.F., late R.F.A., was killed in action on April 4th.

WADE.—Lt. Richard Curtis Wade, R.F.C., who was killed in action on Feb. 26th, was the youngest son of Mr. and Mrs. H. S. Wade, Beckbury House, Shrewsbury. He was 19 years of age.

Engagements.

MOON—ROBERTSON.—The engagement is announced of Mr. N. L. Moon, Hussars, attd. R.A.F., second son of Mr. and Mrs. James Moon, Campden Hill Court, Kensington, and Mary Florence, second daughter of Sir Henry and Lady Robertson, Palé, Corwen, N. Wales

TAYLOR—LUMSDEN.—An engagement is announced between Capt. S. G. C. Taylor, R.F.C., only son of Mr. and Mrs. Sinclaire Taylor, of Bettws, Wales, and Kathleen (Kay), only daughter of Mr. and Mrs. T. Lumsden, of Dartmouth Lodge, Low Fell, Durham.

Marriages.

DUNVILLE—COMBE.—At the Guards' Chapel, on April 9th, Mr. Robert Dunville, Grenadier Guards, eldest son of Lt.-Col. John Dunville, R.A.F., was married to Phyllis, elder daughter of Capt. and Lady Jane Seymour Combe.

HUNTER-PEARSON.—The marriage between Major H. T. V. Hunter, M.C., Rifle Brigade and R.A.F., and Ethel Elizabeth, widow of the Hon. Francis Geoffrey Pearson, youngest son of Viscount Cowdray, took place on Thursday, April 11th.

Births.

BEACHCROFT.—On April 14th, the wife of Maurice Beachcroft, Barrister-at-Law (Temp. Capt., R.G.A., S.R., and R.A.F.), of Uplands, The Ridgeway, N.W.4, of a daughter.

FRY.—On Friday, April 5th, at Greengates, Filton, Glos., to Olave, wife of Lt. C. R. Fry, R.F.C.—a son.

WHITTAKER.—On April 13th, to Elsa, wife of Capt. W. E. de B. Whittaker, the King's Regt., of a son.

* * *

Will repatriated officers and men who may have seen Lt. Streather, R.F.C., in Germany, please to write his mother at D'Arcy House, Finchley Road, Golders Green, N.W.

AIR FORCE.

Deaths.

ENGLAND.—Lt. Norman Herbert England, R.A.F., who was accidentally killed in a flying accident on April 7th, was the son of Maj. F. H. England, late Royal Welsh Fusiliers, and Mrs. England, 29, Campden House Road, Kensington. He was 31 years of age.

JONES.—Lt. Benedict Henry Melvill Jones, R.A.F., who was killed whilst flying on April 4th, was the youngest son of Mr. and Mrs. Benedict Jones, of the Red House, Ashstead, Surrey. He was 20 years of age.

LAKE.—Lt. Harold Caldecott, R.A.F., who was accidentally killed on April 5th, whilst flying in England, was the elder son of Mr. and Mrs. James C. Lake, of 84, Rodenhurst Road, Clapham Park, S.W.4, and 13-15, Little Sutton Street, Clerkenwell, E.C. He was 21 years of age.

STODDART.—Sec. Lt. George B. Johnstone Stoddart, R.A.F., who was accidentally killed while flying abroad, was the son of Mrs. Stoddart and stepson of Dr. W. H. B. Stoddart, of Harcourt House, Cavendish Square, W. He was 18 years of age.

Engagement.

RODWELL—CLARKE.—The engagement is announced between Lt. Denham E. Rodwell, R.A.F., second son of Mr. and Mrs. H. Edgar Rodwell, 100, Philbeach Gardens, Earl's Court, London, and Nesta, only child of the late Robert T. A. Clarke and Mrs. Clarke, of Warwick House, St. Mary Borne, Hants.

Marriages.

GREENWELL—CATCHESIDE.—On April 9th, at All Saints' Church, Gosforth, Northumberland, Lt. Thomas George Greenwell, R.A.F., only son of Mr. and Mrs. T. W. Greenwell, "Northwood," Sunderland, was married to Mabel Winifred, elder daughter of Mrs. T. H. Catcheside and the late Mr. T. H. Catcheside, J.P., Inglewood, Gosforth, Northumberland, by the Rev. W. W. Kennedy, M.A.

FOREIGN COMMUNIQUES.

FRANCE.

April 9th.—Army of the Orient.—Enemy encampments were bombarded by British aviators to the south-west of Demir Hissar.

April 10th.—It is confirmed that four more enemy aeroplanes were brought down by our pilots on March 31st and April 2nd and 6th. A fifth was accounted for by the anti-aircraft defences.

April 11th.—During the day of April 10th two German aeroplanes were brought down by our machine-gun fire.

During the month of March 26 German aeroplanes were brought down by the anti-aircraft defences, eight during the night. To this number must be added two aeroplanes brought down by the Paris defences during the raid of March 11th-12th.

April 12th.—On April 11th our chasing aeroplanes fought numerous actions, in the course of which two German aeroplanes and a captive balloon were brought down.

Twelve other enemy machines were gravely damaged and fell in their lines.

The same day our squadrons dropped 16,000 kilogrammes (about 16 tons) of projectiles on the station of St. Quentin and on the depôts and aviation ground in the region north of Montdidier. A furious conflagration destroyed the hangars of Champien.

A fire and an explosion were observed in the station of St. Quentin.

It is confirmed that an enemy aeroplane and captive balloon were destroyed on March 23rd and two aeroplanes on March 31st.

April 13th.—During Friday our aviators, taking advantage of the fine weather, displayed great activity on the whole of the front, especially in the Somme and Oise regions.

Our chasing machines made over 350 flights and fought 120 actions. Eight enemy machines were brought down, and 23 others fell in their own lines badly damaged. In addition, five enemy captive balloons were burnt, and five others were so badly riddled with shot that they had to be hauled down quickly.

Our bombarding machines were also busy during the day of the 12th and the following night. In all, 48,000 kilogrammes (about 48 tons) of projectiles were dropped during these expeditions, in which Italian aircraft took part. The railway stations of Jusy, Roye, St. Quentin, Nesle, Ham, Guiscard, and Noyon, the railway tracks, the cantonments, and numerous convoys in these regions, as well as the railway stations of Hirson, Laon, and Montcornet, were copiously bombarded. Several fires and some explosions were observed.

April 15th.—On April 13th and 14th four German aeroplanes

WINGED WARFARE

by

Major W. A. BISHOP

V.C., D.S.O., M.C.

The greatest of our young fighting airmen begins the vivid personal story of his adventures and exploits in the air exclusively in this week's

ANSWERS

2D. War-time Price. War-time Price, 2D.

In the short but glorious history of the Air Service, the name of Major Bishop will be recorded as one of the most dreaded fighters ever encountered by the Germans. No fewer than forty-five enemy machines were undoubtedly destroyed by him, and he has been victor in a hundred other fights. He is one of the few men whose decorations include the V.C., the D.S.O. (twice won), and the M.C.

were brought down, two of them by the fire of our machine-guns. Our bombing machines dropped 3,000 kilogrammes (about three tons) of bombs on the enemy establishments and convoys in the region of Montdidier.

Army of the Orient.—Twenty British aeroplanes on Saturday bombarded the aerodrome of Hudovo (in the Vardar Valley). It is confirmed that two enemy chasing aeroplanes were brought down in the course of this operation.

British aviators yesterday bombarded the depôt of Kakara (seven miles S.E. of Seres), causing the derailment of a train.

GERMANY.

April 9th.—The losses in March of enemy aerial fighting forces on the Western theatre of war amount to 23 captive balloons and 340 aeroplanes. Of the latter 158 were brought down behind our lines, the others were observed to fall within the enemy positions.

We lost 81 aeroplanes and 11 captive balloons.

April 12th.—British naval forces, consisting of monitors, torpedo craft, and aircraft, undertook an attack on the coast of Flanders on the night of April 11th. Ostend was bombarded with guns of heavy calibre, and Zeebrugge was bombed by aircraft. The attacks were beaten off without trouble by our batteries. No military damage was anywhere done.

April 14th.—In air battles during the last few days 37 enemy aeroplanes and three captive balloons were shot down. Lt. Monckhoff gained his 24th aerial victory.

In the night of April 12th Capt. Strasser with one of our marine airship squadrons attacked important storage, manufacturing, and shipment places of war industry in central England. Birmingham, Nottingham, Sheffield, Leeds, Hull, and Grimsby were bombed. Despite the extraordinarily strong gunfire encountered and pursuit by aviators all the airships returned safely.

ITALY.

April 9th.—An enemy machine was shot down by one of our aviators above S. Lucia di Piave.

April 13th.—An enemy aeroplane was forced to land by a British aviator in the neighbourhood of Cimadolmo (Piave).

THE WAR IN REVIEW.

Cavalry versus Aeroplanes.

A cavalryman writes of the recent retreat on the Somme:—

That night we crossed the canal and again joined up with the French, who prepared the bridges for blowing up, for it was

evident that we could not hope to beat back such a force as was against us. Next morning we blew up one of the bridges, and moved to make a local counter-attack, for Fritz's machines, which were flying close above our heads, signalled to his artillery, and they opened a pitiless fire on us while still in close formation. We again had to retire, while Fritz's guns and aeroplanes gave us the worst half-hour we had had. Our losses were again very heavy.

Meteorological Effects.

The "Times" correspondent writes from G.H.Q. on April 12th, concerning the German advance towards Bailleul, as follows:—

The weight of the German artillery is very great, and his advance has not been so rapid that, with the favourable weather of the last two days, the enemy has had any difficulty in keeping his guns up. The weather, indeed, has been ideal for his attack, being fine and dry, with sufficient mist to rob us of the advantage of aeroplane supremacy. To-day, however, visibility is perfect, and from the swarms of our aeroplanes I saw in the sky I have no doubt that the Royal Air Force is once more coming into its own.

* * *

The special correspondent of the "Morning Post," writing from France on April 15th, says:—

I hear the airmen referred to repeatedly for their successful efforts in locating the German attacks during the fighting around Bailleul. As one officer said: "They've been flying down right to the muzzles of the machine-guns," and keeping our artillery informed of every fresh concentration. The enemy cannot cover his assembly places, and the formation of large bodies of infantry is detected almost as readily as a demonstration in Trafalgar Square. Yesterday and to-day the airmen have been dropping bombs on columns from a height of a hundred feet. One airman, asked the result of one such expedition, said: "Well, I saw a lot of holes in the column, and there appeared to be a lot of excitement."

The Bombing of Paris.

On April 12th a number of German aeroplanes crossed the lines in a southerly direction. Only two of them succeeded in flying over the Paris district, where they dropped a few bombs. It was officially stated later that 24 persons, of whom six were men and 15 women, were killed in the raid, while 62 persons were wounded.

A considerable amount of material damage was done.

The warning was given at 10.10 p.m., and the "all clear" at 10.40.

Camouflage.

A message from Paris, dated April 15th, states that the last Gotha raid on Paris was not an expedition. It was an individual enterprise, and the watch kept by the listeners was frustrated in a remarkable manner.

Being probably on the alert above his own lines, the German aviator took advantage of the presence of a French bombarding squadron to accompany it. On this particular evening the French aviators were very active, and dropped 60,000 lbs. of explosives on enemy military objectives.

Consequently, there was a large number of aeroplanes about. The German, therefore, passed over his own lines in the wake of the French aeroplanes which were returning towards the south, approached them as nearly as possible so that the sound of his motor should be confounded with that of our machines, and then at the propitious moment made a bend towards the south-east, and soon was over Paris.

As soon as it quitted the French squadron it was recognised and the warning given by the listening post, but the time taken up by the telephonic communication to give Paris the alarm was exactly the same as was required by the Gotha to reach the city.

The Raid on Zeebrugge.

A correspondent of the "Morning Post" writes from Amsterdam that late on April 11th and early in the morning of April 12th a violent air raid by Allied aeroplanes was made over Zeebrugge and the vicinity. Many heavy bombs were dropped, causing considerable damage. It is believed that some submarines have been hit and partly destroyed. None of the raiding machines was hit by anti-aircraft guns.

A French aeroplane which took part in the raid was obliged to descend on Dutch territory. The occupants, who set fire to their machine, were interned.

The Absence of Air Raids.

Mr. G. H. Perris, writing from the French Front on April 10th, says in the "Daily Chronicle":—

An aviator captured attributes the momentary suspension of the Gotha raids on London to the disproportion between the results obtained and the losses suffered either during the raids or in landing on the return. Another traced it to the requirements of the offensive. But except at the beginning, when they kept up with the advance, and reported pretty well on the whereabouts of our retreating troops, the German aviators have certainly not shone, whereas the feats of our own aviators are so numerous, and in some cases so romantic, that it is difficult to do justice to them.

A better explanation of the absence of raiders from London of late is probably to be found in the extreme daring and the success of the French and British bombardment squadrons. Many illustrations of the effectiveness of their raids on aviation grounds and other military works behind the German front could be given.

A peculiarly satisfactory instance is that of the French expedition which threw many tons of projectiles on the aviation ground of Frascaty, near Metz, and the poison gas factory of Ludwigshafen, Mann-

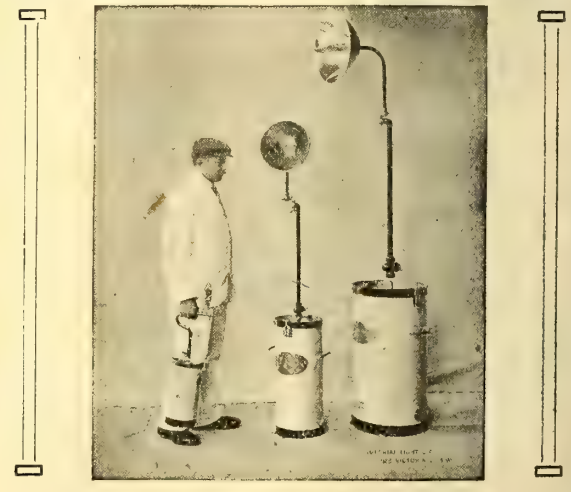
Aeroplane Construction

In aeroplane construction the vital factor is "how many machines can be turned out in a given time." This depends entirely upon the efficiency of the machinery employed. And **no** machine reaches its highest point of production until its clutches, brakes, etc., are fitted with Ferodo Fabric.



Ferodo Fabrics are the most efficient transmitters of energy. Leather, wood, textile beltings, etc., are out of date for Friction drives and Braking purposes. The moment they become soaked with oil they are useless; Ferodo Fabrics never slip, never seize; are not affected by water, oil or acid, and are absolutely reliable under all conditions.

Munitions

Undoubtedly the production of munitions both in the matter of the quantities required and the exactitude demanded in the interests of the Nation, has made essential the use of the best and most modern Machinery and Plant.

We have found it so, and our experience during the War period will be to us of the utmost value in the **Post War** period.

In those days we shall be able to increase our output materially, and still maintain that excellence that has always been associated with the products of the house of

1256

heim—the largest of its kind. A prisoner states that at Frascaty a great hangar was destroyed, with 17 aeroplanes. As for the "Soda Anilin Fabrik," in Mannheim, the manager has stated in Switzerland that it was almost completely destroyed, and that the gas manufacture was altogether suspended.

[Mr. Perris has evidently very waffley ideas on aerial affairs. The absence of air raids has been chiefly due to the weather, and secondarily to the "requirements of the offensive," as the German said. These requirements would be the night-bombing of back areas, and so would have nothing to do with the reconnaissance and infantry contact work at which Mr. Perris scoffs. One hopes that the last paragraph contains the elements of truth.—Ed.]

The Policy of Aerial Bombardment.

A Karlsruhe telegram, published in the "Frankfurter Zeitung" of April 12th announces that the Second Chamber of the Bavarian Diet has unanimously passed a resolution proposed by the Social Democrats requesting the Government to endeavour to get the Federal Council and the Imperial authorities to try to bring about general agreements for the cessation of aerial attacks on places outside the area of military operations. A representative of the Bavarian Government welcomed the motion, saying that the Ministry of the Interior was already in communication with the Ministry of War regarding this question.

The Allies' aerial attacks are still giving the inhabitants of Southern Germany food for thought. According to a Mainz telegram to the "Frankfurter Zeitung" of the same date, a motion by Herr Adelung regarding an enemy aerial attack on Mainz was considered on April 10th at the sitting of the War Committee of the Second Hessian Chamber. The Minister for Foreign Affairs, Dr. von Ewald, made a long reply, but the proceedings were declared confidential. Herr Adelung finally suggested that the Hessian Government should urge on the Empire an agreement between the belligerents to avoid aerial attacks on places outside the war zone.

Fire at Friedrichshafen.

A Reuter's message states that a telegram from Romanshorn, southern side of Lake Constance, opposite Friedrichshafen, reports that the great shed at Manzell, near Friedrichshafen, the original home of the Zeppelin airships, was completely destroyed by fire on April 13th, along with the adjoining inn. The fire is supposed to have been due to an explosion. The flames were visible throughout Eastern Switzerland.

An Attack on Kastelorizo.

A German submarine fired seven shells on April 10th against the small island of Kastelorizo, near Rhodes Island, occupied by

Rule-of-thumb methods will not serve to-day.

It is regrettable, but nevertheless true, that such unsatisfactory methods are still practised to-day, and more to be regretted from the point of view of our particular industry that they are practised by some self-called welders. We constantly receive jobs on which attempts have been made to effect some necessary welding repair, resulting in utter failure, with the incompetence of the repairer written all over them; the consequence is that the cost of putting the matter right is more than it would have been had the job been entrusted to us in the first instance, and, in some cases, the casting is ruined beyond the hope of repair.

It is *quicker, cheaper,* and more *satisfactory* in every way to send your repairs to a firm of Known reputation. There is no firm with a better name than

The New Welding Co.

The wreckage shown in the left-hand corner was once an aluminium gearbox from well-known make of car. The owner feared his car would be permanently off the road, as a new box could not be obtained. Hoping against hope, he brought it to THE NEW WELDING CO. The repair of equally bad smashes comes as a matter of course to the technical experts of THE NEW WELDING CO., and the repair in question did not alarm them in any way. The job went through the necessary operations, and in due course was completed as shown on the right. But the owner was so delighted that he expressed himself as having found in actual practice that THE NEW WELDING CO.'s repairs were everything, and more than the very flattering opinions he had previously heard concerning them.

THE NEW WELDING CO., 26, Rosebery Avenue, London, E.C.1. 'Phone—5252 Holborn.

the French. When the bombardment began an enemy aeroplane appeared over the island and dropped two bombs.

The R.F.C. in East Africa.

A correspondent of the "Times" writes on April 10th:—In connection with General Van Deventer's dispatch the following story of how the enemy force in German East Africa under Tafel came to be captured is of interest:—

A certain officer of the R.F.C. was out on a reconaissance in the region of the Rovuma River, but found "nothing doing." Having to land, he thought it wise first to get rid of his "eggs," so he chose a quiet spot and dropped them, causing, of course, considerable noise of explosion. He then flew home. Tafel was then marching to join his chief, von Lettow, but, hearing these explosions, he diverted his line of route considerably (from south-west to south-east), and before long bumped into a British force. Ultimately his whole force, some 3,000 strong, surrendered, as General Van Deventer reports.

The aviator learned the result of the unloading of his "eggs" some time afterwards.

Hill Tribe Troubles.

The "Times" correspondent, writing from Simla on April 6th, says:—The news from the North-West Frontier continues to be satisfactory. Aeroplanes have been effectively used in the operations against the Marri tribe in Baluchistan.

Casual Observations.

One who reads the papers has a rare collection of tit-bits to disgust him this week.

A correspondent in Russia who so far has been very well-informed on things there, judged by what we already know, writes that 10,000 aeroplane motors have been discovered hoarded up for the conquering Huns in Petersburg.

Other officially authorised rumours talk of irregularities in connection with the American contracts for supplies of aero material for factories.

There is a feeling that the "war-scandal" business has been overdone. Anyway, no nation seems immune, so it must be inherent in humanity, kultured or not so.

Talking of the former, Munich is said by yet another newspaper to have formed an enormous company for promoting Aerial Transport. The Bavarian towns have taken up all the shares, for they hope that Munich will become the hub of the Trans-European flying routes. An example of what such an aerial port should be is planned as a future glory of that city.

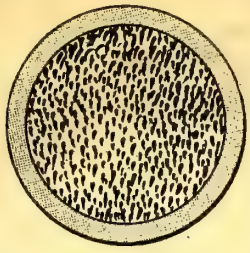
"Aeroplane" Blue Book 1918
A DIRECTORY OF AIRCRAFT FINANCE
By G. A.
Financial Editor of the "Aeroplane."

THE large and increasing number of Aeroplane Companies make it an urgent necessity to the many interested in the Industry to have, in a concise and handy form, a reliable Work of Reference. "The Aeroplane Blue Book" contains particulars of all the principal public Aeroplane and kindred Companies, giving:—



The Capital of each Company and how divided.
The Amount issued and paid up. Loans and Mortgages.
Names of Directors and other Officials.
Registered Offices. Date of Incorporation.
Profits and Dividends paid and declared.
Date of making up Annual Accounts and when submitted.
Extracts from last Balance Sheet and Directors' Reports.

Woodworking Machinist Foreman now at liberty; thorough practical mechanical knowledge of Sawmill routine, and rapid production. Used to aircraft, propellers, general high class woodwork to fine limits, and economical conversion of timber.—Box No. 3514, The Aeroplane, 166, Piccadilly, W.1.

Buyer-Advertiser (Grade 3, 24) seeks position as assistant buyer or progress clerk; seven years' experience in buying department of metal and hardware exporters; capable and intelligent. London district preferred.—Box No. 3513, The Aeroplane, 166, Piccadilly, W.1.

The Services of a Gentleman with exceptional opportunities are at the command of any firm desirous of extending their interests in the aeronautical world. — Write Box 552, c/o Hooper & Batty, Ltd., 15, Walbrook, E.C.4.

WANTED.

Wanted Woodwork for aeroplanes, very large up-to-date factory, fully equipped with latest machines; any class of aircraft work undertaken; prompt deliveries; best work.—Apply Box 3030, The Aeroplane, 166, Piccadilly, W.1

Wanted, aircraft wood work. First-class work in any parts, well equipped, prompt attention, experience in making and assembling.—State full particulars to Box No. 3486, The Aeroplane, 166, Piccadilly, W.1.

Rubber Twill Cuttings, in any quantity. State average size, quantity and price required, to Aylen, 38, Sun Street, London, E.C.2.

Contracts wanted for woodworking, light forging, electro-plating (also aero engine parts) by old established firm (largest in their line in world) with most up-to-date woodworking plant in Yorkshire. Able to guarantee accurate work.—Simpson Fawcetts, Hunslet, Leeds.

Cowls and all kinds of Sheetmetal work for Aircraft wanted by London firm.—Box No. 3515, The Aeroplane, 166, Piccadilly, W.1.

AIRCRAFT PARTS.

Hardwood for Aeroplanes.—Specially Selected air-dried timber as supplied to leading constructors in Britain and the Continent. Silver Spruce, Ash, Poplar; Hickory and Ash Skids; Three-ply; Thin Cedar and Mahogany for Floats; Walnut for Propellers.—William Mallinson and Sons, Ltd., Hackney Road. 'Phone, 3845 Central, 4770 Wall.

Tapes, Webs, Cords and Threads in all qualities, suitable for Aircraft Work. Delivery from stock.—John MacLennan and Co., 30, Newgate Street, London, E.C.1. (See Advertisement Page IV. of cover and Buyers' Guide).

Aeroplane Seats. We can give quick delivery of cane seats, A.G.S. 264 or other patterns, guaranteed pass inspection. Write us for anything required in cane work.—The Willowbrook Company, Leicester

We undertake Contracts for light engineering work. Ask for quotation.—R. L. Dubois & Co., Aeronautical Engineers and Manufacturers, 673, Romford Road, Manor Park, E.12.

Immediate Deliveries of metal fittings, light presswork, etc. Good workmanship; prompt deliveries.—Box No. 3512, The Aeroplane, 166, Piccadilly, W.1.

MODELS.

T. W. K. Clarke and Co., Ltd., Model Department, Hampton Wick.—Though we are full up with full-size aeroplane parts orders, we still build models as we did in 1906. Sopwith Biplanes, etc., in Stock.—Send 3 stamps for our illustrated List, 120 items and 14 models; certain metal goods are out of stock.

FOR SALE

Tarpaulins.—Waterproof khaki sheets for sale; also few second-hand railway truck tarpaulins; London works.—For prices and particulars write Johnston, 12, Broughton Road,

For Sale, quantity 2½ x 10 wire nails. Offers wanted.—Apply Box No. 3496, The Aeroplane, 166, Piccadilly, W.1.

For Sale, about 100 ft. Shafting, 3in. diameter, complete with couplings, roller bearings, and several pulleys. Planing Knife, Grinding Machine, Screwdriving and Boring Machine. All in splendid condition.—Apply Box No. 3517, The Aeroplane, 166, Piccadilly, W.1.

ENGINEERING.

ON THE COMMAND OF THE ROYAL AIR FORCE

Some idea of the deep and widespread anger felt by all who are concerned with Service Aviation over the removal of Major-General Sir Hugh Trenchard may be gathered from the way in which the affair has been taken up by Members of Parliament and by the "Morning Post," which is to-day—so far as one can discover—the only daily paper which is not under the thumb of either this dire Government or of the Asquith clique.

It is true that General Trenchard resigned, and was not technically dismissed, therefore one writes advisedly of his "removal." It may be, however, that his resignation was a sound piece of strategy. Sir Hugh Trenchard is recognised by all the best authorities, especially abroad, as one of the great soldiers of this war.

We have recently seen the result of Field-Marshal von Hindenburg's voluntary withdrawal from the Somme to the St. Quentin line early in 1917, which entirely spoiled our "Spring Push," and allowed him so to organise his forces that his return has gained for him more ground than he lost. If von Hindenburg had held to his old Somme line he would have been gradually badgered and beaten into impotence long before he was ready for his great offensive. Perhaps this may be an omen of General Trenchard's return, but, all will hope, with the great final difference that, whereas von Hindenburg must suffer defeat on his reconquered territory, Sir Hugh Trenchard will return to command the King's Flying Service in its final victory.

If General Trenchard had been a smaller man he would have hung onto office as long as he could. As a result he would have become the butt of Government-inspired newspapers. And after a sufficient period the attacks by the jackals of the press would have weakened his position so that he would have retired, weakened and beaten, just as other good soldiers have retired through similar causes.

As it is, he has done absolutely the right thing. He has retired in such a way that he cannot be attacked, and so that he is in a stronger position than even he has ever been before. The newspapers dare not attack him, for if they did their game would be too ridiculously obvious and they would merely defeat themselves while increasing his already great prestige. Thus he has apparently spoiled Lord Rothermere's Spring Push.

General Trenchard is not a political soldier; he is one thing and one only—a great general of fighting men. He is the last man in the world to wish to attract attention as the subject of a public discussion. The fact that his removal has caused such an outburst of anger is at once testimony to the immense influence which he has acquired by his work in the field, in spite of his self-effacement so far as concerns the mere vulgar public, and to the soundness at heart of the British people, who still have the ability to recognise a great man when one is vouchsafed unto them.

Therefore one is justified in saying that his position to-day is stronger than it has ever been. When the proper time comes for him to return, Heaven help those who stand in his way!

The Proper Position.

The obviously proper position for General Trenchard to occupy is that of Commander-in-Chief of the Royal Air Force, after all the Naval side has been handed back to the Navy where it belongs. The position of Chief of the Air Staff is not big enough for a soldier of his calibre.

After all, the C.A.S. is merely a member of a Committee, dignified perhaps by being called the Air Council. We in this country are being ruined through government by committees. Now, as ever in the world's history, the ideal form of government is a benevolent despotism. If ever a Service needed a despot to run it properly the R.A.F. is that Service. And the peculiar fitness of General Trenchard to fill the part of the benevolent despot is almost too obvious to need indicating.

Benevolent despots throughout history have deputed the duties of attending to the details of their organisation to an astute Vizier, or Chief of Staff. It seems quite possible that General Sykes, who is undoubtedly a very able organiser, would precisely fit that particular office. One is perfectly ignorant as to whether General Trenchard would find the same difficulty in working with General Sykes as that which General Henderson gave officially as his reason for resigning from the Air Council. Like Mr. Balfour on another subject, one is a child in these matters. But, if only such an arrangement could be made to work, one can imagine nothing more likely to lead to the highest efficiency in aerial warfare than that General Trenchard should be appointed C.-in-C. R.A.F. with full powers, and that General Sykes should be his right-hand man.

Thus one would have a great strategist and tactician, who is also one of the greatest leaders of men whom this country has ever produced, in absolute command of our Air Power, with an exceedingly clever organiser and handler of detail work as his Chief of Staff. Which is not in the least to say that General Trenchard is not a clever organiser, or that he is weak on detail. Far from it. But his outstanding qualities as a leader and as a general of fighting men obviously make it more desirable that his whole energy should be directed towards the higher and larger questions of air war, and to maintaining and increasing the *moral* of his men, than that he should bother himself with the details of organisation and administration, the very work in which General Sykes particularly shines.

Outside Opinions.

One has been accused from time to time of making this paper the organ of one's personal opinions. Nothing is further from the truth, for whatever ideas, theories, or opinions are herein set forth are invariably the collected and condensed views of many others, all

of whom are well qualified to hold such views. In this particular instance it seems well to quote at length some outside opinions, expressed by men of experience. Here is one notable example of the feeling which exists regarding the Government's treatment of the King's most loyal servants :—

Lieut.-Col. A'Court Repington, C.M.G., a soldier of great active-service experience, formerly editor of that brilliant official publication, "The Army Review," and until recently the military correspondent to the "Times," writing in the "Morning Post" on April 17th says :—

Mr. Lloyd George has misled the House of Commons, as he has the country in almost every statement that he has made about the war since we had the misfortune to entrust him with the direction of it. War has found him out. It is a sterner and harsher taskmaster than the Lobby.

The whole object of Mr. Lloyd George, in his Paris speech as on April 9th, was to divert his responsibility upon the soldiers. His is a mean and an un-English attitude and frame of mind. He has never known how to treat soldiers or sailors, and the difference between his shabby behaviour towards them and the generous terms in which great men like Chatham and Sidney Herbert always referred to generals in the field is just all the difference in the world.

Mr. Lloyd George understands nothing about war. No Prime Minister of England in a great war has ever been so disastrously *mal entouré*. All the servile, superficial, and unbalanced minds of politics and the Press have been his bane.

Press proprietors and editors, with a few honourable exceptions, have grovelled at his feet. He has not sought for truth but for obsequiousness and servility. He has always preferred the military advice of some young booby in uniform—provided he were not over the rank of lieutenant—to the reasoned advice of the late General Staff, which was the best in Europe and impeccably honest.

He gets rid of Jellicoe and Robertson, and now allows Lord Rothermere to get rid of Sir Hugh Trenchard, one of our few indispensable men, and goes his own way rejoicing with his kindred spirits.

He has chosen to assume the mantle of Chatham, and has been crushed under its weight. He has attempted to conduct the war without understanding its elements or first principles. With the blood and tears of England his errors are expiated by those innocent of fault.

In the same issue of the "Morning Post" one of those able and honest men who set forth in its leading articles the sanest and most truly patriotic views on the conduct of the war which are to be found in any daily paper says :—

It is impossible not to regret that Lord Rothermere, being so keenly alive to the urgency of providing this real stragetic staff, should, as a first step towards it, have accepted the resignation of a soldier of such distinction as Major-General Sir Hugh Trenchard. In the Flying Service Sir Hugh Trenchard's is perhaps the most outstanding name, and as chief of the fighting organisation in France his services were brilliant.

By general consent his appointment as Chief of the Air Staff was recognised as the fittest that could have been made. Yet suddenly we are informed that Sir Hugh Trenchard has resigned, because "he took a view as to the powers and duties of the Chief of the Air Staff which the Secretary of State of the Royal Air Force could not accept."

With all respect to Lord Rothermere, it is no sufficient compensation to know that he remains Secretary of State, though Sir Hugh Trenchard is no longer Chief of the Air Staff.

Yet a third opinion from a letter published in the "Morning Post" of April 20th deserves to be quoted. The name and position of the writer is not made known, but from internal evidence it is clear that he is closely in touch with the R.F.C. This letter says :—

In this war we have taken the initiative little enough, in fact only in the air have we led all the way. At the battle of the Somme our great air offensive—Trenchard's offensive—beat the Hun, and kept him on the other side while we harassed his troops, transport, and commnuications with machine-gun fire and bombs. His artillery machines were unable to work freely, ours worked all day.

Twice since then the enemy has gone "all out" and for a time contested the right of way—but only for a time. Our production was too sure, our men too good and well trained, and our *moral* too great. Again, the great noble Chieftain Trenchard had foreseen all, and with his whole-hearted energy, great brain, and wonderful personality was prepared to meet this endeavour of the enemy and beat it. To-day, when more than ever before, the Hun wishes for air supremacy to help in his great final effort to overthrow the British Empire and the Allies, he can do nothing, he is more at our airmen's mercy than ever before.

Thousands of his troops die, his preparations for attacks are often broken, and his supplies stopped, and this because the British Empire had in Trenchard a really great, far-sighted, and strong soldier: I say unhesitatingly one of the greatest soldiers that England has to-day. He had the absolute confidence of all the R.F.C.—he inspired them. He held the trust and confidence of the R.N.A.S. and their respect, and more still our noble French Allies honoured, trusted, and loved him for his greatness, his success, and his absolute sureness.

In the air we have made no mistakes; the Allies and the enemy will both acknowledge this as a fact. It is the one Service where England has led all the way. And now, at a time like this, the great Chieftain goes.

Does he go of his own accord? No, his great heart was too wrapped up in his work, so much so that the people of England knew and heard little of the man who made us masters of the air and saved how many thousands of their sons upon the ground.

Then why does he go? We want to know, and we must know. Who is Rothermere? What has he done for the British Empire as far as the war in the air is concerned? He is not a proved man.

People of England, you have a proved man, a man who is yours heart and soul, a great soldier and a great leader and organiser—are you going to let him go without a word? His successor is perhaps a great man, but is he a proved man as far as the Air Service is concerned? It were better that he had never come, and that Rothermere left than that Trenchard went.

This is no time for change or for experiments. Under the new *régime* some things *may* be better, but this is not a time to risk their being worse. All men have confidence in Trenchard. Will they have equal confidence in the "new man"?

Confidence is essential, that we know. Too many lives, too many of your sons' lives, oh Mother Country, are at stake. Trenchard in all his work has always considered the cost, and always a life given to-day has meant lives saved to-morrow.

The Inner Reason.

That letter reads as if it came straight from the R.F.C. itself. In the last sentence you have the inner reason for the confidence which the Corps has in its great leader. "Always a life given to-day has meant lives saved to-morrow."

Only great men achieve the honour of nicknames. To the R.F.C. Sir Hugh Trenchard is known universally as "Boom." Obviously it is not for his love of advertising himself, for until Lord Rothermere's unfortunate "Spring Push" he was less known outside military circles than any of the young Hun-killers to whom he had awarded decorations, and whose unrecognisable photographs appeared in the cheaper news-prints accordingly. The name is, in fact, used as a mingled expression of affection and respect, as one might give a similar nickname to a very effective piece of heavy artillery, and no more implies disrespect than did the name "Dizzie" as applied to the late Lord Beaconsfield by all loyal Conservatives, or "The Grand Old Man" as applied to the late Mr. Gladstone by his party. General Trenchard was given the name as a Major, at the Central Flying School, on account of his deep voice and the general impression he gave of bigness—an impression well confirmed on active service—and the name is now fixed among all Service aviators.

One mentions this partly in order to explain the hold which he has over his men, and partly to make understandable a phrase which indicates how great is that hold. Not very long ago a gallant young squadron-commander R.F.C. was discussing the *moral* of his pilots and the happy condition of the Corps in general on active service, and remarked, "My people will do pretty well anything I want them to do, but if 'Boom' asked them to fly over the mouth of Hell on box-kites they'ld do it without a murmur. They'ld probably say, 'We don't know what his game is, but if Boom wants it done we suppose it's all right.' And off they'ld go."

Under it all was the feeling that a life given to-day meant lives saved thereafter.

The Personal Touch.

Another incident, told by one of the squadron concerned, illustrates General Trenchard's personal influence. At the time of the Somme Battle in 1916, a certain squadron had lost heavily. All its best men had been shot down, or had disappeared in Hun-land. The places of the casualties had been filled up by new pilots fresh from home, without fighting experience, and they had perforce to be pitched into the thick of the battle. The *moral* of the squadron went to pieces, and pilots took to coming back before crossing the lines, complaining of "dud engines"—and other more or less imaginary troubles.

The local C.O. was in despair, and reported the state of affairs to Headquarters. Soon afterwards General Trenchard appeared at the aerodrome. He went round and inspected the sheds, chatted with the pilots about their machines, armament, and so forth, but never said a word about the trouble which they all knew had brought him there. Then he lunched in the mess, and the pilots and observers felt very uncomfortable, expecting a lecture afterwards.

When lunch was over he got up and walked towards the door. As he reached it he turned round, looked them all over slowly as they stood by their tables, and said in his short gruff way, "Well, you're good boys," and walked out.

That was the sum total of his speech, but they all understood. From that day forward there was not a better squadron in the Corps. Many of those lads died gallantly doing their duty, but they went to their deaths gladly, for they knew that their Chief understood them and their troubles.

The R.F.C. is full of such tales of General Trenchard's astonishing hold over those who have the honour to serve under him. Surely neither at this stage of the war nor at any other stage can we afford to lose one of the greatest leaders of men whom this generation has produced.

General Henderson's Resignation.

As regards General Henderson, the reason given officially for his resignation—namely, that he could not work with General Sykes—tallies with the statement made in these pages last week that these officers did not agree when together in France early in the war. One prefers to think, however, that Sir David Henderson, in resigning, was more influenced by his consideration for the honour of the Army than for his personal feelings.

It has been one's duty to disagree with General Henderson's policy both before and during the war. That his policy of centralising supplies by making the Royal Aircraft Factory at Farnborough an aerial dockyard with absolute control over the designs and products of the Aircraft Industry was hopelessly wrong has been proved by the bitter experience of war. In a perfect world it would have been excellent. In this imperfect world, free competition is the only road to progress.

General Henderson stood for unification and centralisation. There were those who said that his sole motive was the personal ambition to have all Service aviation in his own hands. One has, however, always believed that his real motive was a desire for perfection, and that he simply did not recognise the impossibility of its achievement. He backed the wrong horse in all sincerity, and the effect came near being disastrous to those who had to pay the bill. Disaster was only averted by the personal influence of General Trenchard over the active-service aviators. What then could be more natural than that General Henderson should in his turn stand by the gallant soldier who saved the R.F.C. in its time of trouble?

Of General Henderson's aeronautical life one may say, as was said of King Charles II—"Nothing in his life became him so well as his leaving of it."—That is if he has left it.

Of Sir Godfrey Paine.

It was stated last week that Sir Godfrey Paine had resigned along with Sir David Henderson, as a protest against the removal of Sir Hugh Trenchard. It is now said that Commodore Paine tendered his resignation, was asked by an Exalted Personage to think it over, thought it over, and kept his job.

Being a Naval officer, doubtless he was not bound to support General Trenchard and General Henderson on a point touching the honour of the Army, and so, having recorded his protest, probably he has done as much as could well be expected of him.

Lord Rothermere's Position.

The position of Lord Rothermere is undoubtedly difficult. One may give him credit for the best intentions, but he may after all be only adding to Hell's proverbial pavement therewith.

It would seem that there are two very distinct Lords Rothermere. There is one who has the highest aims, and who placed the world in his debt by endowing a Chair of Literature at the University of Cambridge. There also appears to be a Lord Rothermere who ran, before he became a Cabinet Minister, a paper largely devoted to half-baked sensationalism—as, for example, when, after the murder of the late Mr. William Whiteley, the "Universal Provider," and after the murderer had been dealt with according to the law, the paper in

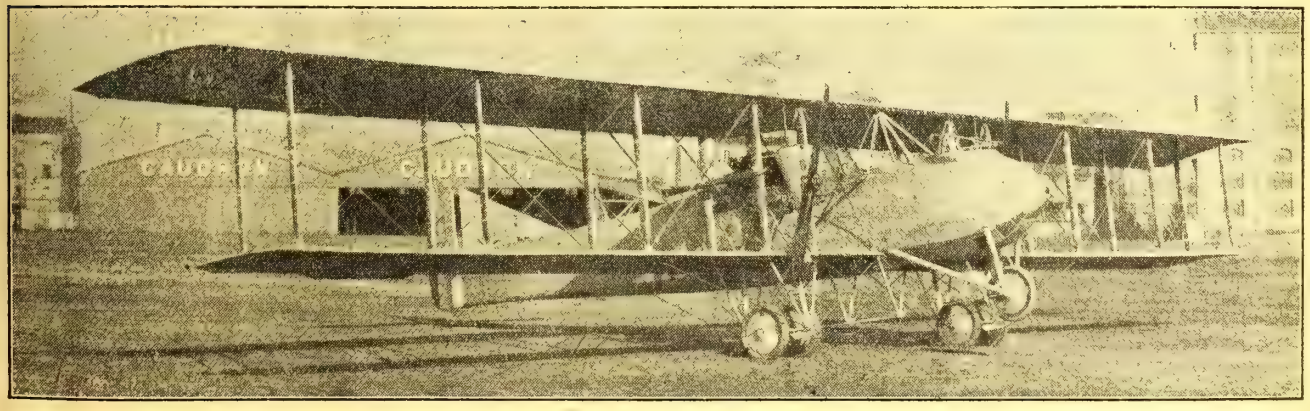

Photo and details supplied by Caudron Co. from France.

A Caudron Twin-Tractor Fuselage Biplane with two 140-h.p. Hispano-Suiza Engines. Length, 11.75m. Span, 21.13m. Area, 72.4 sq. m. Speed, 143 klm. per hour.

question, *faute de mieux* in the way of a photograph of the murderer living or dead, published a photograph of the murderer's posthumous child at the age of some few hours.

One is not quite clear which of these noblemen is responsible for the upheavals in the Command of the Royal Air Force. Presumably it is the former, seeking after the highest ideals in the way of efficiency. In such case it is to be regretted that he did not accept the advice, most respectfully tendered through this paper, that he should sit still and do nothing for six months while he was learning the elements of his new job. Thus he might have avoided certainly some irreparable mistakes and much undesirable sensation.

The Limitations of Youth.

It would appear that, like Mr. George, Lord Rothermere is *mal entouré*, being prone to take advice from the wrong people and to act upon it without seeking for the sound military reasons for things being as they are. Judging by such papers as appear to acquire the "stable tips," he has that same implicit belief in the judgment of the young as it attributed to Mr. George.

A philosopher has said, "None is omniscient, not even the youngest of us." The profundity of the satire is worthy of note by those who prate about this being a young man's war. The great German generals, whose strategy has been so remarkable, even though their tactics have been defeated by the tenacity of the French and British troops, are all over 60 years of age, and the majority of them are nearer 70.

Those who talk of Alexander the Great conquering the world before he was 30 forget that history does not record the names and ages of the generals who worked out his strategy for him. If the German Crown Prince had captured Verdun, he would have been held up as a youthful military genius—for purposes of dynastic advertisement. When he was defeated, an aged general who had failed to do the impossible—owing to French gallantry and self-sacrifice—was duly debited with having been the real commander of his army.

In the British Army no general has done better than Sir Herbert Plumer, who was not a young man when in South Africa he set forth regularly once a fortnight to relieve Mafeking, and invariably failed to reach it—a little piece of strategy which kept General Sneeman and several thousands of perfectly good Boers extremely busy, and so prevented them from capturing or preventing the relief of Kimberley. Since then some fifteen years of study and experience have but increased his value as a tactician and as an army commander.

This passion for youth is apt to become an obsession with some people, and when carried to excess it may become a national danger.

It is true that in actual fighting very young men, as a rule, have things all their own way, but in the High Command age—or at any rate middle age—has its revenge. The R.F.C. has been singularly fortunate in finding young and brilliant officers for its higher ranks. General Trenchard is only 45, which is very young indeed for his great position and influence. General Salmond, G.O.C. R.F.C. in the Field, is only 36. And General Sykes, the new C.A.S., is but 40 years of age.

Surely none could reasonably expect sound and mature judgment from younger men. So why this outcry for youthful advisers?

War by Committee.

We hear much of the great Strategic Council which Lord Rothermere is to set up. One would ask him whether he knows anything of the conferences continually held, both here and in the field, composed of the Officers Commanding various forces and their most able junior officers? Youth is there free to relate its experiences and to offer its suggestions. The mature judgment of middle age weighs and sifts those suggestions and absorbs new ideas from the experiences related. Thus the O.C. is kept up to date in his ideas and is able to form sound conclusions. And he alone gives a decision.

It may be true that "in a multitude of councillors there is wisdom," though experience ranging from Parish Councils to the Houses of Parliament leads one to doubt it, but it is certainly true that "too many cooks spoil the broth." Government by committee has brought this country to the verge of ruin. War by committee can only mean dire disaster. Lord Rothermere has never given evidence, any more than has Mr. George, of understanding the work, the aims, or the psychology, of the soldier, therefore he will be well advised to leave such matters to soldiers.

The Committee of Public Safety and all the other foolish imaginings of French Revolutionary democrats brought France low. It needed a Napoleon Bonaparte to bring her to her full power, and even that failed to reach the earlier glory of the French Monarchy, built up by loyal Generals who made war in their own way, with the full support of their King and country, and free from interference by civilians and committees.

Thus, and not otherwise, shall Great Britain attain to her full power in the air. The loyal General who is able to win that power for his King, and who possesses the full confidence of all those who have to fight under his direction, must not be permitted to go at the bidding of politicians.

Questions of Personnel.

Much capital is made, by the papers which support Mr. George and his friends, out of Lord Rothermere's removal of minor officials from the Air Ministry. None can accuse this paper of having been lenient to the shortcomings of the Hotel Bolo, and it is at once agreed that many officials ought to go. But so far as one can gather, Lord Rothermere has not even begun to remove the worst obstructionists, so one cannot see where or why any credit is as yet due to him. He has, it seems, merely come in at a moment when it had been decided by others that certain people had to go, and he brought with him the power to eject them.

When the late Sir Stanley Maude, certainly a most able general, went to Mesopotamia, he took with him many more troops than were at the disposal of his predecessor, and he found the hospital scandal already cleared up. When General Allenby, also a General of proved ability, went to Palestine, he also had greater forces at his command than had his predecessor. Therefore, before blaming General Nixon and General Murray for failure, it would be only fair to consider what they might have done if they had had the same forces as had General Maude and General Allenby. Similarly, before acclaiming Lord Rothermere as a Heaven-sent genius, it would be wise to consider what Lord Cowdray might have done if he had been invested with similar power.

Such troubles as exist are entirely on the Production side, more especially in the Technical branch, and here, one imagines, Sir William Weir may well be trusted to do what is right, if advised from the purely military point of view by the Comptroller-General of Equipment, himself a safe pilot, if elderly for active-service flying. Lord Rothermere will do well if he devotes his attention to giving effect to the recommendations of these two experienced officials, and will do better if he leaves questions of personnel and operations entirely to soldiers.—C. G. G.

ON THE BLAZING INDISCRETION.

It is to be hoped that those who brought about the unification of the Flying Services into the R.A.F. are now beginning to appreciate the consequences of their well-meant but ill-advised action. If the whole movement from beginning to the present day had been a skilfully concocted German plot to paralyse Britain's Air Power at the most critical moment of the war it could hardly have worked out more exactly according to schedule.

Never could there have been a better proof of the dangers of a single Flying Service than has been provided by the upheaval in the Air Council. If the two Services had still existed entirely separately the removal of the Chief of one Service would not at all have affected the other. But, with only a single Service, the practically complete abolition of the people who have built up that Service from its beginning might well lead to utter chaos and the break-down of its whole fighting power.

Suppose for example that, owing to intrigues at home, the Navy broke down. We should still have our Army on which to depend. And the Army would certainly improvise a Navy until the Navy recovered itself. Similarly, with two separate Flying Services belonging to the Navy and Army respectively, if one became feeble owing to intrigue or maladministration, the other could carry on until it recovered. With a single Service there is no such opportunity for recuperation.

That the Royal Air Force has not broken down under the shock of the loss of General Trenchard's lamentable removal and the resignation of General Henderson—not to mention the resignations tendered by other officers who are not at liberty to throw in their hands at will—is testimony to the loyalty of the junior officers and officials who know that it is their duty to carry on in spite of whatever may be happening away up over their heads. Certainly the continued existence of the Flying Services as a fighting force does not place us under any obligation to the politicians who have brought about this upheaval.

The Ridiculous Theory.

At best the work of the politicians is an example of what a coiner of picturesque phrases once called a blazing indiscretion. At worst it is an ugly intrigue. One dismisses at once the absurd theory that it is all part of a deep-laid enemy plot, which, having, by years of cleverly laid planning, produced a single Air Force, at once proceeded to wreck it by instigating personal quarrels between the leading men, and intrigues between cliques.

Such things happen in the pages of Mr. William le Queux, but they are scarcely credible in real life, even in war-time when "crook plays" on the stage seem tame compared with the things which are known to be going on under the guise of munition deals. The Germans are painstaking, industrious, far-sighted, and brave. They possess many other qualities which are wholly estimable when they happen to pertain to one's friends, and wholly obnoxious when they belong to an enemy. But they are neither super-men nor are they super-devils. They are not even a race of Machiavellis.

The Family Likeness.

One has never been a believer in the alleged diabolical skill of the Germans in planning every move in the game for thirty or forty years ahead, as is the mania of some people. Racially the Germans and English are too closely allied for any such immense psychological divergence to exist. The Germans are, in fact, as prone to commit colossal blunders as are we ourselves, though perhaps of a different kind.

If they were anything else but blunderers, they would have won the war two years ago. If they were anything like as skilful in laying their plans beforehand as some people believe, they would have won the war in the first six weeks. Everyone who knows anything of Germany's military state immediately before the war knows perfectly well that Germany went into the war at least two years before she was ready for it, because, for various reasons, political, sociological, and financial, it seemed better to take the chance which then offered than to wait till she was fully prepared.

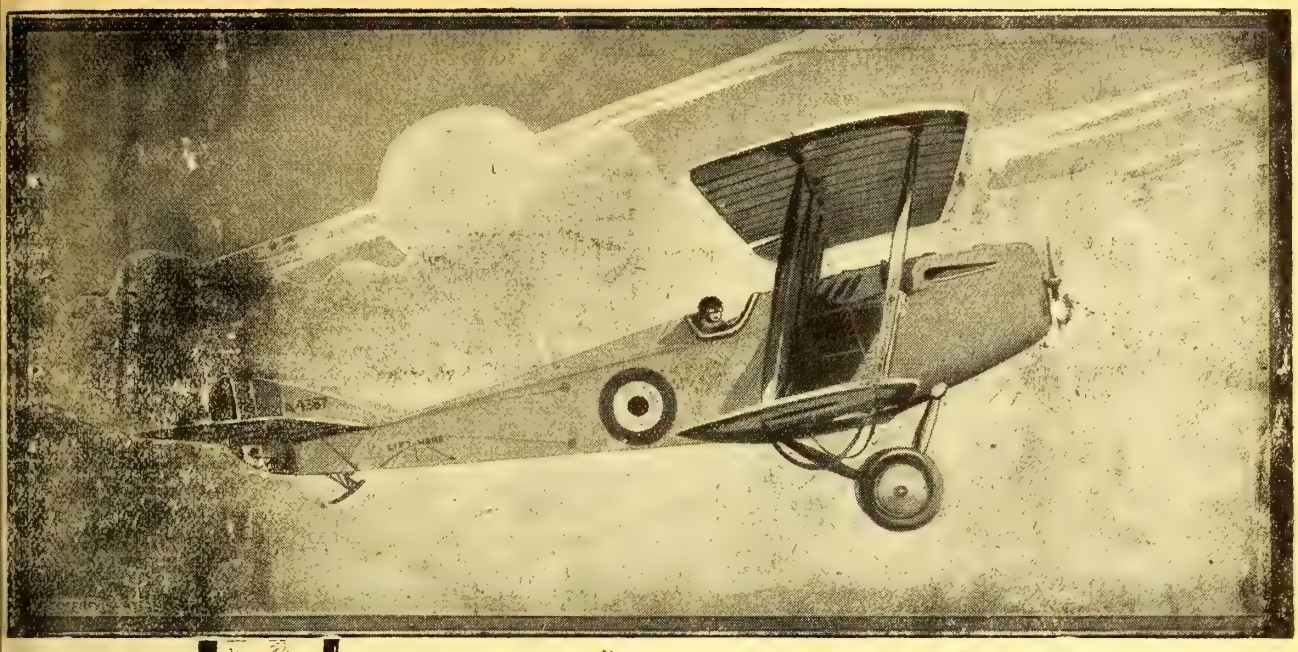
Being governed by a single-minded military aristocracy, Germany was better prepared than any other country. That is why Germany has stood up successfully against the rest of the world for over three years, and has managed to give a very fair imitation of a victorious nation. She has successfully demonstrated the superiority of aristocracy over democracy. The fact that she has not won the war is due to the inherent qualities of the remnants of the aristocracies of Britain and France which have held these nations together and have led their fighting men in spite of being hindered by pettifogging politicians and hampered by democracy

The Obvious German.

The Germans are not clever. They have that genius which is an infinite capacity for taking pains. And they have great talent in making the best use of the obvious. All the legends about their forty-year preparations for war indicate no more cleverness than that of the man who insures himself against fire. Any other than a nation of fools would begin, immediately after one victorious war such as that of 1870, to prepare for the next war.

All the stories of the Hidden Hand, which is said to blackmail our chief politicians into impotence, indicate no real cleverness, but merely the full use of obvious methods.

Many years ago a soldier of one's acquaintance was talking to a German officer, a great friend of his, about the German Secret Service, and the German said:—"Yes! We do things pretty thoroughly. For example, in case we find it necessary to invade England, we have a complete list of every post-office and sub-post-office in the British Isles, with particulars as to which are the places where there are telegraph instruments to be found, and which are the places where money is kept for paying money orders. We even have a list of the names of the individual post-masters and post-mistresses."



"Good God!" said the simple British soldier. "How on Earth did you get all that information? It must have cost you thousands!"

"No!" said the German. "We merely went into your General Post Office in London, and paid sixpence for your so interesting Post Office Guide."

The Application of the Story.

Getting hold of information with which to intimidate politicians is just about as simple as that. And the use of information so obtained is just about as easy as robbing the till of a captured post-office, or commandeering its telegraph instruments. This is the more so when one has to deal with a country like England, in which the Nonconformist Conscience is such a dominating power that a really great man like the late Sir Charles Dilke could be ruined for life over a peccadillo which would not even make a Continental damsel blush.

The cardinal sin in this country is that of being found out. The pet minor sins of our chief politicians are common knowledge to all. Yet that does not make

WOKING, Surrey.

their fear of public exposure any less. Thus they are able—to put it politely—to bring pressure to bear on one another when their own interests or the interests of their party or clique or protégés so demand. The results may be disastrous to the Services or to the country, but that is a minor matter to a politician so long as he can hold his job, and remain a whited sepulchre, even with some spots on his reputation by way of Futurist decorations.

Which is why one does not believe in these diabolically clever German plots.

The Effect at the Bolo.

Thus one may absolve the Germans of having had any hand in the affair which has caused such an upheaval in the Flying Services. The whole thing has been caused by our own damned foolishness, and it serves us right.

The people with whom one has sympathy are the hard-working officials—Service and civilian—who have to carry on with their jobs at the Hotel Bolo—begging its pardon, the Cecil—while earthquakes are happening all round them.

Even as it is, this upheaval has had very serious effects on the work of the Air Force staff, for none can keep his attention fixed firmly on the all-important work of filling up forms, when every two minutes someone pops his head in at the door and says, "Have you heard that Smith has resigned?" or "Is it true that Jones has got the boot?"

Each minor official is so anxious about keeping his own job that he forgets his work in order to secure himself in office. A humorist remarked the other day, "I hear that the Seccotine and Croid people are going to declare enormous dividends this year!" and when some innocent asked him, "Why, particularly?" he replied, "Because of the sales of their stuff to all the people who are trying to cement themselves into their chairs at the Bolo."

Anyhow, the net result has been to paralyse the work at the Air Ministry, partly through the fear of some officials over losing their jobs, partly through the anger of others over the whole business, and partly through the gossiping tendencies of others, who spend their whole time talking about it all.

Fortunately there happens to be a fully adequate supply of aeroplanes and engines in stock for the people at the front. Also, orders and material in hand will keep the aircraft factories going for a long time ahead. Therefore the effect of the upheaval, so far as supplies for the active-service people are concerned, is, happily, nil; nor, indeed, would it matter much if the whole Hotel Cecil took a month's holiday in which to discuss its internal politics.

The Effect in the Field.

One cannot, naturally, write openly of the effect of this ugly business on the aviators in the field. One knows, however, that the whole of the R.F.C. is boiling with black rage against the politicians who have dismissed their great leader. If any of the political people dared to show their faces in an aerodrome in France to-day they would receive but short shrift.

It is perhaps as well for the politicians that the active-service aviators are too busy fighting to give attention to affairs at home. There might be some unpleasant truths told if matters were otherwise. As it is, the fighting men of the Flying Services are too loyal to their King to be put off their work by political intriguers.

Also, if they have a suspicion that enemy intrigue has anything to do with the affair, it is not likely to make them any more tender towards their open and honourable enemies in the field. There are no Bolsheviks in the Flying Services, whatever there may be among politicians. All are full out to win the war.

Affairs in London will not abate one whit the energy and determination of the aviators at the Front. Like the famous Gloucesters, who won the right to wear their helmet badges on the back as well as the front of their headgear, by fighting to a finish and defeating an enemy force which attacked them in front and rear, the R.F.C. will win as proud a tradition by defeating its enemies abroad in spite of intrigues at home.

THE AIR FORCE'S TROUBLES IN THE HOUSE.

Resignation of General Sir H. Trenchard.

On April 18th **Mr. Pringle** asked the Prime Minister whether, before the resignation of Maj.-Gen. Sir Hugh Trenchard was accepted, the differences or policy between Gen. Trenchard and the Air Minister came before the War Cabinet; and whether he can, consistently with public interest, state the questions of policy upon which a difference of opinion arose between the Air Minister and Gen. Trenchard?

Mr. Bonar Law: The answer to the first part of the question is in the affirmative, and to the last part in the negative.

Mr. Pringle: Does the right hon. gentleman not realise that great public interest is taken in this matter, and can he not see his way to make a statement which will allay some of the unrest which has arisen?

Mr. Bonar Law: I realise that there is great public interest in it, but I think the House will see that it is obvious one cannot discuss in public questions of principle of that kind.

Mr. Pringle: Is it not the case that the question of principle is one not affecting any war policy, but simply as to the methods of organisation in which the leading expert of the Air Staff had regard to efficiency in the field and the Air Minister had regard to advertising in the Press?

Mr. Bonar Law: The hon. member is apparently giving his own version of the difference of opinion. As I have said, in our opinion it is not desirable to discuss the matter by way of question and answer.

Colonel Sir H. Verney: Has the right hon. gentleman any idea of the dismay and disgust in the Air Force in France over this matter?

Mr. Bonar Law: No, Sir; I think it is obvious that I cannot be expected to give an answer to a question of that kind, which would give rise to difference of opinion.

Mr. Hogge: As the Government have got rid of the head officers of the Navy, the Army, and the Air Force, can the right hon. gentleman say how long this practice is to continue of getting rid of competent people?

Mr. Joynson-Hicks: Will the right hon. gentleman consider whether it would not be possible to make a statement adding a little more information, which will give no help to the enemy, but might allay feelings which to some extent undoubtedly exist?

Mr. Bonar Law: I am quite ready to consider that, like any other desire on the part of the House to discuss a question. I do not think it is desirable, at all events in question and answer, to discuss a subject of this kind.

Mr. Pringle: I beg to give notice that I shall raise this question on the adjournment to-night.

Resignation of General Sir D. Henderson.

Mr. Pringle asked whether, since the resignation of Major-General Sir Hugh Trenchard, any and, if so, what other member or members of the Air Council has or have tendered his or their resignation?

Mr. Bonar Law: The Vice-President of the Council, Lieut.-General Sir David Henderson, K.C.B., D.S.O., has tendered his resignation, on the ground that he felt that he would be unable to work with the new Chief of the Air Staff.

Mr. Billing: Is it not a fact that for two years and a-half we have been endeavouring to get a strong policy in our Air Service, and that now we have a Minister who is taking a strong policy this House seems not to agree with him?

Mr. Pringle: What is the policy?

Mr. Billing: Having his orders obeyed.

Mr. Pringle: Getting advertisement in the Press.

Royal Air Force Staff.

Mr. Llewellyn Williams asked the Under-Secretary of State to the Air Ministry whether, in view of the complaint of Lord Rothermere that a great number of excellent officers are engaged in filling up unnecessary forms, he will say if the number of officers in the Department of the Controller-General of Equipment has recently gone up from 110 to 350, and if, whereas the old Equipment Gunnery and Organisation Gunnery of the War Office had only twenty officers, the number in the Directory of Armament, which has taken over the functions of those two departments, has been raised to 140; and whether these increases

THE BRITISH & COLONIAL AEROPLANE CO., LIMITED

were made with the knowledge and approval of Lord Rothermere?

Major Baird (*in a written answer*): The Department of the Controller-General of Equipment is a new department formed on the creation of the Air Ministry, which took over equipment responsibilities for both the Royal Flying Corps and the Royal Naval Air Service. The number of officers was 351 when the department was formed and it is now 317. The policy was to include as many attached officers as possible, so as to keep a free hand to reduce as consolidation of Royal Flying Corps and Royal Naval Air Service services proceeds and decentralisation of services into Air Force areas is arranged. This and other cognate questions in the Air Ministry are being investigated by a strong committee appointed ad hoc. As regards the second part of the question, the gunnery section forms part of the armament branch in the Department of the Director-General of Aircraft Production, who is responsible to the Minister of Munitions.

BUSINESS OF THE HOUSE.

Sir R. Cooper: Do I understand that to-night, when the motion for adjournment comes on, the Air Service will not be represented?

Mr. Bonar Law: No. I did not say that, but I did wish it to be made quite plain that I do not feel bound to attend on the adjournment whenever an individual member wishes to raise a question.

Mr. Billing: Will any member of the War Cabinet attend?

Mr. Pringle: I can say what the right hon. gentleman was doing the last time I raised a matter on the adjournment.

Mr. Hogge: Playing at chess!

Mr. Speaker: I really must deprecate these very offensive observations. I have already had to reprimand one of the Press Gallery for introducing into the public Press references to the private acts of Ministers and of members when they are in attendance here. If, in addition to that, hon. members are going to make in this House statements as to what Ministers and members do in the lobbies and the smoke-room and the dining room, then life here would become intolerable.

[It would certainly be to the advantage of the nation if life in the House of Commons were made so intolerable for most of the present Cabinet as to force them to leave it. Meantime, while they insist on remaining to inflict themselves on a suffering country, the least they can do is to attend to their businesses instead of flouting the country by going out to play when their duty should be to listen to the complaints of the few of the people's representatives who have the pluck to complain about the Government's misdeeds.—Ed.]

ON THE ADJOURNMENT.

Mr. Pringle said that the Leader of the House had intimated that he could not be present, that he would not be present, and that the Secretary to the Air Ministry would not be there. Mr. Bonar Law was not conversant with the facts of Major-General Trenchard's resignation. It would be more satisfactory if there were to be a discussion, and was willing that a whole day should be given to the discussion of this subject. Motion, by leave, withdrawn.

* * *

On April 22nd **Mr. Bonar Law**, asked by **Commander Bellairs** whether his attention had been drawn to the anxiety created by the resignations of the two officers of greatest experience in the Air Service from the Air Council, and whether he would give a day for discussion in order that an adequate statement could be made on the administration of the Air Council, and, if necessary, discussed, said the Government would be glad to arrange for such a discussion if there was a general desire for it. The most convenient occasion for it would be on the Vote for the Air Ministry in Supply.

Major Sir J. Simon: Did the War Cabinet ever see General Trenchard about his difficulties before the Government dispensed with his services?

Mr. Bonar Law: I do not think that question arises.

Sir E. Carson: Can my right hon. friend say when this discussion will take place? We do not want to have it postponed.

Lord H. Cecil: I hope it will be before next Monday.

Mr. Bonar Law: It will be as early as possible. The subject for Supply day this week—Thursday—has already been allotted. We hope, however, to arrange for some day next week before Thursday.

Mr. McKenna: There would be no objection on this side to postponing the Munition Vote, which has been put down for Thursday next, and taking the Vote for the Air Ministry.

Mr. Bonar Law: I shall see, then, whether it is possible to arrange it for Thursday of this week.

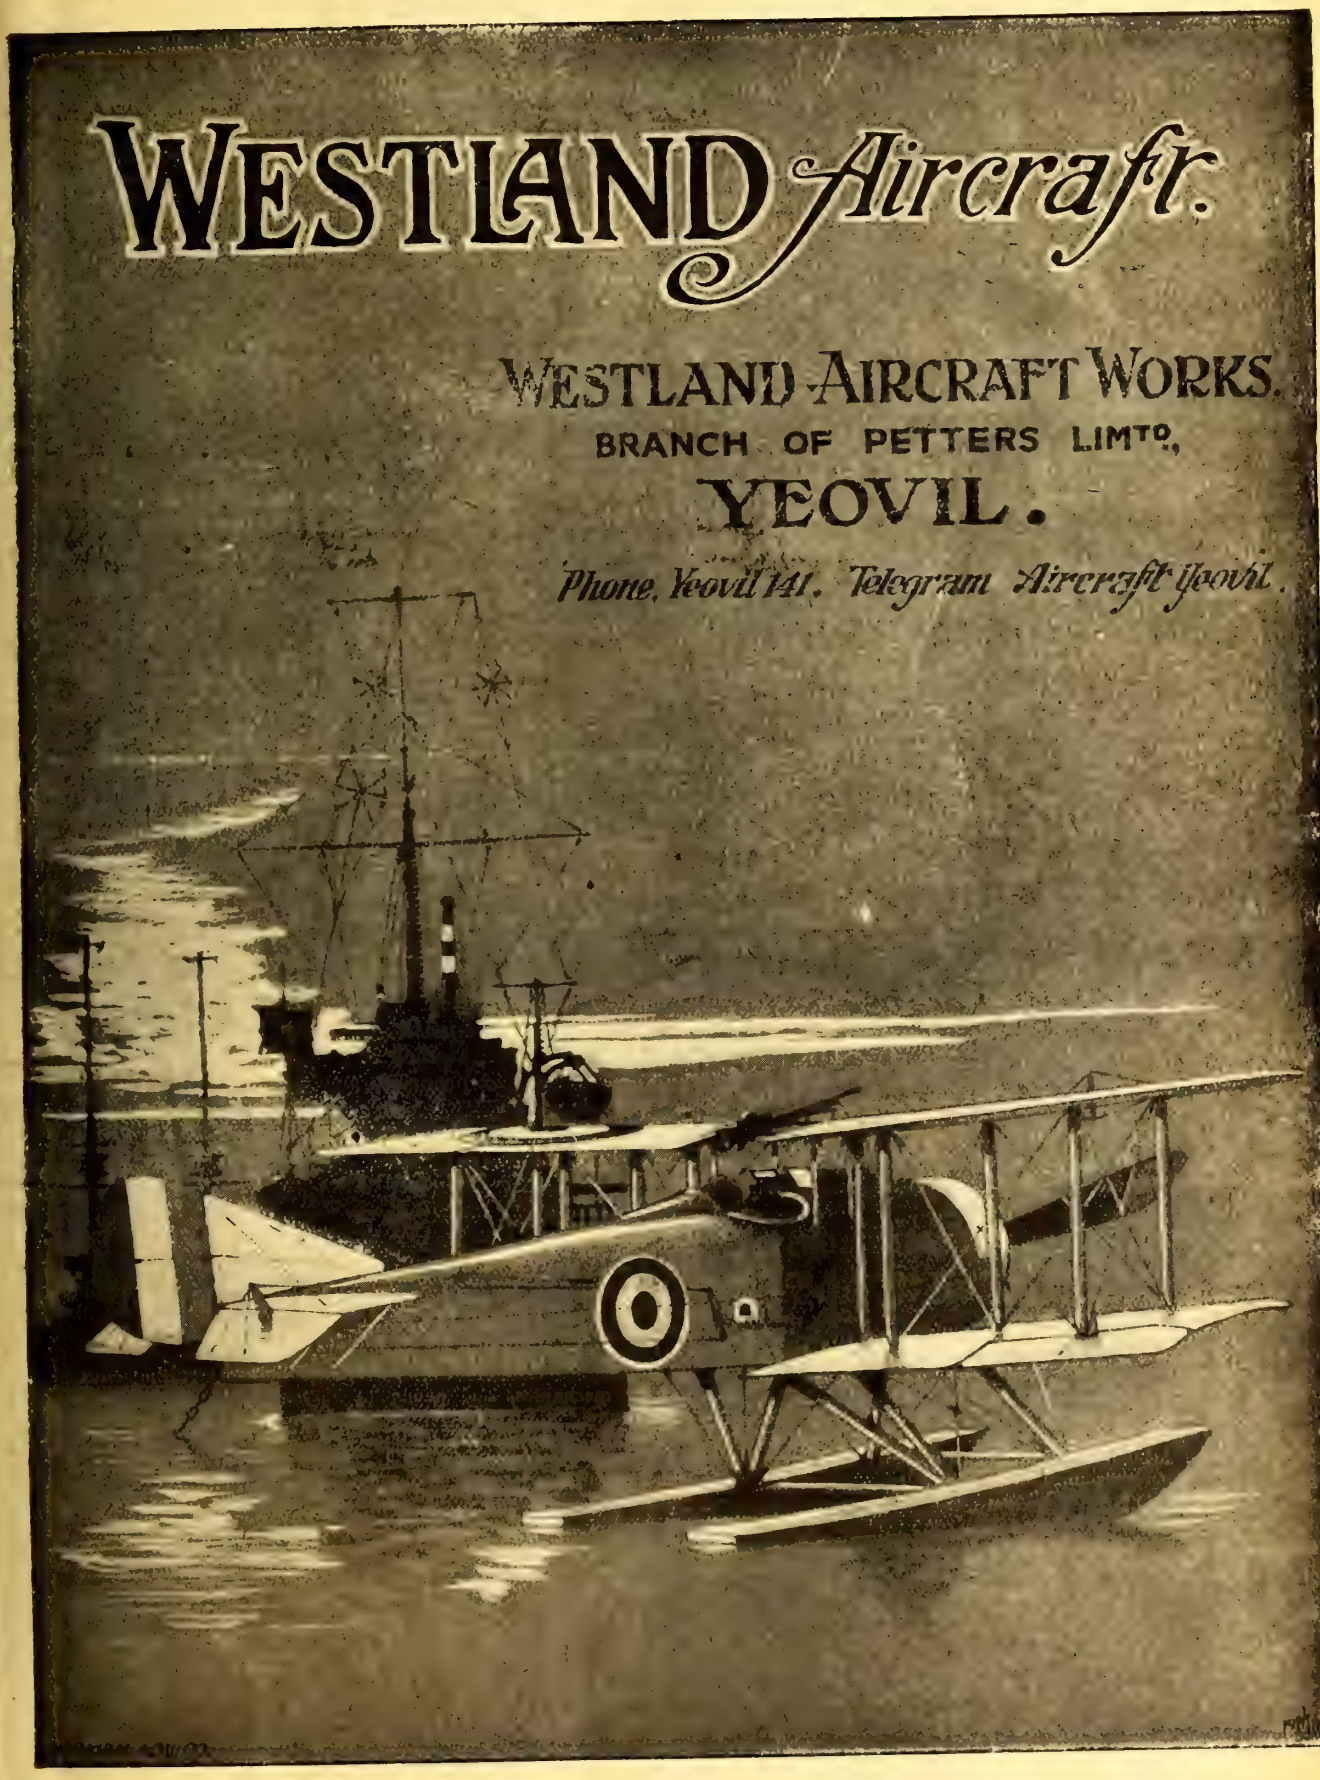
"THE AEROPLANE"—PRICE SIXPENCE.

By agreement with the contemporary aeronautical papers it has been decided that on and after the first issue in May the price of all such weekly papers shall be raised to sixpence. This will first take effect on the issue of THE AEROPLANE dated May 1st, which will be next week's issue.

This step has been rendered necessary by two facts—firstly, the shortage of paper, and, secondly, the ever-increasing price of paper.

In order to conserve the available supply of paper to the utmost it is only right to prevent waste, and any copies which are sold to people who do not actually want them are obviously wasted. People who really want THE AEROPLANE will be willing to pay sixpence for it. Those who will not pay sixpence obviously do not want the paper. Thus waste will be prevented.

At the same time every effort will be made to make the sixpenny AEROPLANE worth the money. It is, unfortunately, impossible to buy better paper than that which is now being used, for it seems that the whole available supply of decent paper has been bought for a long way ahead by the good-class picture papers. But it is hoped that when the conditions of the paper market settle down under the new regulations, and when it is discovered how the available supplies of paper are to be distributed, it may be possible in future to give more and better value in the way of pictures and reading matter, and possibly better paper, for sixpence than is now obtainable for threepence.



At the same time, if readers will consider how much the prices of commodities have gone up all round during the war, one believes that few of them will quarrel with the new price. When a penny egg costs 4d.—and is stale at that—and when a 3d. whiskey costs 9d., and even then is only at half-strength, and very small for its age, one is inclined to think that the mental pabulum provided by THE AEROPLANE for 6d. will be considered worth the money in war-time.

People are always willing to pay for amusement and for information on technical matters. They will even stand being told the truth if they have to pay for hearing it, instead of having it thrust upon them for nothing. One hopes, therefore, to provide enough of all these desired commodities to give readers full value.

One wishes readers to understand clearly that the raising of the price is not a profiteering effort. It is therefore well to point out that, though the paper will be sold in future at 6d. per copy retail, the price which the proprietors actually obtain from the wholesale newsagents is nearer 3d. than 4d. The price of the better paper on which THE AEROPLANE was printed before the war was about a penny a pound, whereas the stuff on which it is now printed costs anywhere between 6d. and 9d. a pound, and is likely to cost more. A sum in simple arithmetic, with the assistance of a letter-weighing machine, will soon show whether there is any profit on the sale of the paper.

All other charges, such as printing, publishing, office expenses, and so forth, have to be found out of advertisement income, so readers may easily see for themselves whether any profit is being made out of them or not.

At the same time, the proprietors of THE AEROPLANE are determined that all those who really wish to have this paper regularly, in spite of the increased price, shall have it. Therefore, if any difficulty is found in obtaining it from newsagents, the proprietors particularly desire to hear all about it. Letters on this subject should be addressed to THE AEROPLANE, 166, Piccadilly, W.1, giving full particulars as to any reasons alleged by news-agents for the difficulty of getting the paper, and also giving the name and address of the news-agents.

MANFRED VON RICHTHOFEN.

The greatest of our enemies in the air, Rittmeister Freiherr Manfred von Richthofen, is dead. The R.F.C., his particular foes, will have heard the news with mixed feelings. They will rejoice that he is out of action, but they will regret sincerely the death of a gallant gentleman who fell bravely doing his duty.

Only a few days ago one of the best of our own air-fighters expressed the hope that he and von Richthofen might survive the war, so that they might compare notes.

Some few months ago a dinner was given by his squadron to one of our best men, in honour of his winning the D.S.O. In returning thanks the hero of the evening, as gallant a lad as ever flew, stood up and proposed the health of von Richthofen. And the fighting men of the squadron duly honoured an enemy whom they respected. Both the proposer of the toast and his enemy are now dead. One hopes that beyond the shadows they have met as gallant enemies do when they have fought a good fight and peace has come to them.

Those two incidents indicate, one believes, the feelings of the R.F.C. towards Rittmeister von Richthofen. There is not one in the Corps who would not gladly have killed him. But there is not one who would not equally gladly have shaken hands with him had he been brought down without being killed, or who would not so have shaken hands if brought down by him.

Manfred von Richthofen came of a good Junker family, as is evidenced by the use of the nobiliary prefix to his name. His people were landowners, for generations much given to horse-riding and shooting, so that he was of the right breed for a fighting pilot, but were not as a rule professional soldiers.

From his own memoirs one learns that he had adopted the profession of arms and was already a lieutenant of Uhlans before the outbreak of war. He only took to flying in 1915, and spent most of that year as an observer on the Russian front. Late in the year he became a pilot, and, after some service near Verdun, returned to Russia as the pilot of a C. type (reconnaissance) machine. There he was selected in August, 1916, by the great Bölcke as a recruit for his Jagdstäffel of Fokkers.

It was not till September, 1916, that von Richthofen brought down his first British opponent, and, as his score practically started from that date, he has been the victor in some 80 aerial affairs in nineteen months, out of which period he was away from the battle area for some months. One who has written of his death questions the figures claimed for him, remarking with the meanness typical of Fleet Street that "experience has taught us that German official statements are by no means to be implicitly trusted, and the general opinion in British aviation circles is that Richthofen was credited with all the machines brought down by the squadron—or 'circus' as the Germans call it—which he had commanded since the death of Boelke."

Apart from the fact that German figures are as a rule singularly accurate—except when deliberate strategic lying is done—and that the Bölcke squadron was never commanded by von Richthofen, and that the Germans never called the von Richthofen Jagdstäffel a "circus"—the word being purely an invention of the R.F.C.—it is an absolute lie to say that it is the opinion of British aviators that von Richthofen was credited with the score of his squadron. The squadron score was given officially long ago as some 200 "aerial victories."

The only deduction to be made from the 80 claimed is due to the fact that the Germans have always counted sunk kite-balloons along with aeroplanes as "victories." Many a fighting pilot says that he would much rather fight any German aeroplane than attack a K.B. through its screen of Archies, so perhaps the Germans are justified in counting balloons in the score. If one deducts 10 K.Bs. one still has to give him credit for 70 aeroplanes, and the R.F.C. knows better than anyone else how closely those figures have been approached by some of our own best fighting pilots.

His death is bound to have a gravely depressing effect on the German Flying Service, for obviously the younger and less brave pilots will argue that if a von Richthofen cannot survive their chances must be small. Equally his death is an encouragement to the younger French and British pilots, who can no longer imagine that every skilful German who attacks them is von Richthofen himself. Which is the fullest possible justification of the policy of the British Army in refusing to make "star turns" of its crack pilots, in spite of its badgering by newspaper proprietors whose only desire is sensation, regardless of whether it is healthy or not.

However, Manfred von Richthofen is dead. He was a brave man, a clean fighter, and an aristocrat. May he rest in peace.—C. G. G.

AN AIR MINISTRY APPOINTMENT.

The Secretary of State for the Royal Air Force has appointed Mr. Bertram Jones to be Civil Assistant to the Controller-General of Equipment in the Air Ministry.

ANOTHER AIR MINISTRY APPOINTMENT.

The post of assistant secretary of his Majesty's Office of Works having become vacant by the appointment of Mr. W. A. Robinson, C.B., C.B.E., to be Permanent Secretary to the Air Council in the Air Ministry, it has been decided to postpone the appointment of a successor until after the war.

Mr. James Eggar, O.B.E., principal clerk, will act as assistant secretary in the meantime.

The First Commissioner of Works has also appointed Mr. E. H. Bright, C.B., M.V.O., Principal Clerk of Contracts, to be Director of Contracts and Labour.

NEW WORK FOR A PIONEER.

J. Samuel White & Co., Ltd., of Cowes, Isle of Wight, notify that Wing Commander Gerald Aldwell, R.N. (retired), has been appointed General Manager of the Aviation Department of that firm.

Commander Aldwell will be remembered by those connected with aviation in its early days as a pioneer of Naval aviation, for he was one of the first Naval engineer-officers to be appointed for aviation duties. As an engineer-lieutenant he was appointed to the Eastchurch Air Station, and took his pilot's certificate, No. 630, on a Short biplane, his certificate being dated 15th September, 1913. Ever since he has been closely connected with the R.N.A.S.

In February, 1914, he participated in a serious aeroplane accident with another officer and was so badly injured that for some months he was incapacitated from all duty. In the early days of the war, although still suffering from his injuries, he did highly valuable work in charge of a Recruiting Station for air mechanics, and owing to his excellent judgment many of the most valuable men in the R.N.A.S. were admitted to the honour of serving His Majesty.

Although he never completely recovered from his injuries he was appointed to technical duties abroad and did very valuable work until his health broke down entirely and he was invalided out of the Service. While on active service his uniform cheerfulness under adverse circumstances, his personal gallantry under fire, and his strong sense of justice, won for him the highest regard of all who served with or under him.

Prior to taking up aviation Commander Aldwell was connected intimately with the early experiments in submarines, and while in the Submarine Service his name was officially noted for early promotion because of his gallantry in rescuing ratings from a submarine in which an explosion had occurred.

Commander Aldwell's long and extensive engineering knowledge, coupled to his great experience of aviation both before and during the war, and his close connection with Active Service needs and methods should make him an extremely valuable acquisition to the Staff of Samuel White & Company. He will carry with him in this new work the best wishes of all other pioneers of Service aviation, and of a multitude of the younger generation who have had the pleasure of serving with him.

CELLON

LIMITED.

Broad Street House, New Broad Street, London, E.C.2.

Change of Address.

Please note that we are removing to larger and more centrally situated offices, and that on and after the 29th April, 1918, our address will be

22, CORK STREET,
LONDON, W.1.

Our Telephone Number will be **Gerrard 440** (2 lines), and our Telegraphic Address **"Ajawb, Reg, London."**

CELLON, LTD.

ROYAL APPROVAL.

The following was published in the Press on April 22nd :—

The Minister of Munitions has received the King's commands to convey to the officials of the Ministry, to the employers, and to the munition workers throughout the country, both men and women, his Majesty's high approval of the exertions made during this critical time and his satisfaction at the remarkable results achieved.

The King has learned from the military authorities that practically all the losses and expenditure of munitions during the battle have already been made good without any undue depletion of normal reserves out of the resources which had been held in readiness and by the additional effort which has been made. There are now actually more serviceable guns, machine-guns, and aeroplanes with the British Armies in the field than there were on the eve of the German attack The other supplies of all kinds are forthcoming in abundance.

The King has commanded the Minister of Munitions to express his great pleasure to the workers and all engaged in this vital task. Travelling constantly about the country with the Queen from one munitions centre to another the King has had ample opportunity of witnessing the strenuous efforts which are being made by the men, and certainly not less by the women, to keep the soldiers who are fighting supplied with all they need, and also of admiring the organising ability displayed in so many ways and on so great a scale. The King is deeply impressed by the fact that much-needed holidays have been cheerfully given up and additional exertions made at a time when many severe food restrictions had come into force, and that, in spite of large numbers of munition workers having left the workshops for the Army during the last six months, the outputs of every kind have not only been maintained but have steadily increased. Accordingly, the King has directed the Minister to convey his Majesty's thanks to all concerned.

THE DEATH OF M. GEORGES JUCHMES.

Those who were connected with the early days of ballooning and airship work will regret to hear of the death of Georges Juchmès, who died in Paris on February 24th after a long and painful illness.

The name of Georges Juchmès will always remain intimately associated with the history of aeronautics in connection with the period of transition from the classic days of ballooning in the last century to the prodigious developments of to-day.

M. Juchmès was born in Paris on July 18th, 1874, and was seventeen years of age when he made his first balloon descent as a pilot in 1891, after having been the pupil of the famous Georges Besançon. When the construction of airships became a regular industry M. Juchmès was appointed director and manager of the aeronautical establishments at Moisson created by MM. Lebaudy, and he passed eight years there working with M. Julliot at the construction and tests of the first Lebaudy airships—the *Patrie*, *République*, and *Liberté*, the performances of which surpassed all hopes. His services to aeronautics won him in 1913 the Croix Chevalier Legion d'honneur.

At the outbreak of war he was mobilised as a Lieutenant-Pilot of military airships, and did his duty gallantly. He was shut up in Maubeuge during the siege, but succeeded in escaping and was appointed to Chalais-Meudon where he worked at the development of the parachute which is now used on all French airships and kite balloons. At the time of his death he was the chief of the workshops which he had set up for the construction of these vehicles.

M. Juchmès also held the medal for saving life given by the French Government for his devotion to duty as Mayor of Moisson through the floods of 1910. The parents of M. Juchmès were Lorrainers, and he is another example of the good service done to France before and during the war by the inhabitants of the debatable territory.

THE FRIEDRICHSHAFEN EXPLOSIONS.

Berne, April 15th.—" La Suisse " learns that shortly after 8 o'clock on Saturday evening, April 13th, the workshops at Manzell, near Friedrichshafen, formerly engaged in building Zeppelins and now manufacturing aeroplanes, were burnt down. The blaze was visible all over eastern Switzerland. Swiss returning home have been made to promise not to reveal the extent of the disaster.

Zurich, April 16th.—The latest reports of the fire at Friedrichshafen indicate that the whole of the extensive aeroplane works at Manzell were completely destroyed. The loss to the German military aircraft industry is exceedingly serious. Incendiarism is suspected.

A telegram from Geneva to the " Temps " states that definite information on the subject of the fire in the Gotha works at Friedrichshafen shows that it was caused by bombardment by Allied airmen.

[The " Gotha " factory was, in fact, the factory where Friedrichshafen bombers are made. They are twin-engined machines of quite a different type.—Ed.]

The factory has been entirely destroyed. It is definitely reported in Germany that at the time of the fire on Saturday there were 30 complete squadrons of Gothas at Friedrichshafen, which were being kept in reserve for the special purpose of fighting the American aerial fleet.

[This, of course, is pure rot. Thirty squadrons would be at least 450 machines. And anyhow, they are not fighting machines but bombers pure and simple. Why the American fleet should be dragged in is not apparent.—Ed.]

The " Matin " learns from its Zurich correspondent that two Zeppelins and 40 giant aeroplanes were destroyed.

[This is a much more likely story.—Ed.]

Geneva, April 16th.—The Exchange Telegraph Company's correspondent says that two Swiss travellers who have just arrived in Constance declare that the people of Friedrichshafen were in such a state of panic that throughout Sunday there was a frenzied rush of the inhabitants towards the localities on the borders of the lake, and even as far as Constance itself.

The explosions caused a most frightful panic in the town mingled as they were with the screech of the alarm syrens which, in fear of something unknown, suddenly mingled their strident shrieks with the pandemonium and completed the work of sowing terror among the inhabitants. Throughout Sunday the explosions and fires continued, doing considerable damage not only in the workshops themselves, but also in the whole of the western part of Friedrichshafen, where several houses became a prey to the flames or were demolished by the fall of enormous pieces of material, and above all by the hydrogen vessels which were sent hurtling through the air by the explosions.

[The explosion of the hydrogen bottles is probably at the root of the whole yarn.—Ed.]

It is stated at Constance that two " grand model " Zeppelins were destroyed and two vast gas reservoirs. Added to these a number of giant aeroplanes of the Friedrichshafen type were wiped out.

Approximately something like 40 workshops must have been consumed, and the Maybach motors in particular suffered. The works are now guarded by a double cordon of troops, and bodies of police are still engaged in removing the charred remains of victims of the fires. From one source it is learned that the number of victims totals about 140 dead and 200 injured.

[Most of these statements are obvious lies, and the truth probably is halfway between them and the veiled disclosures of the German communiqué, which will be found in its proper place.—Ed.

DO WE WANT AIRCRAFT?

The following letter has been received from an important firm of metal merchants :—

Sir,—At the present moment when the output of aeroplanes is of vital importance it may interest you to learn that the Air Board have decided to dispense with merchants of this country who have been carrying stocks of aircraft steel, on the ground that available supplies are not sufficient to go round.

Notwithstanding this, however, they are opening stores in various parts and supplying consumers from same, which practically means that they are acting as merchants themselves.

If this would in any way help to relieve the situation we should be patriotic enough to accept their decision and devote our energies in other directions, but we hear on every hand nothing but complaints of the delay and difficulty experienced by aircraft contractors in obtaining their supplies from Air Board Stores, which would not have occurred had the warehouses and staff of the stockholding merchants, with their years of experience, been taken over.

[Is it really at all likely that a number of Government embusqués without business experience, or of wounded officers likewise without business training, are likely to handle the distribution of steel supplies as well as people who have made such work the business of their lives? It is this kind of foolishness which fills the Hotel Bolo with useless people, not the necessary staff work of the Army, which is very efficiently done.—Ed.]

AMERICAN REORGANISATION.

The Washington correspondent of the Associated Press telegraphs on April 22nd :—

"President Wilson has definitely decided on a readjustment of the aircraft programme, and Mr. Baker has been directed to carry it out. It is intimated that production will be put in the hands of one man. An announcement on the subject may be expected soon."

[And quite time, too, from all one hears.—Ed.]

DRAUGHTS AT THE HOTEL CECIL.

Doubtless the epidemic of colds which broke out in the Hotel Cecil and its ancillary edifices last week was due to the cold weather and the general draughtiness of the buildings. Or it may have been because the medical examination of the entire male staff, with a view to discovering how many of them were fit for active service, necessitated a certain amount of standing around insufficiently clad. It seems improbable that the gusts were entirely vertical.

One refuses to believe that the revolving front door had to be fitted with a brake to prevent it from turning into a turbine, or that life-lines had to be fitted along the grand staircase to prevent the entire staff from being propelled to the roof by the wind blowing up the building.

ROLLS-ROYCE

Supremacy in the Air

Rolls-Royce Aero Engines like Rolls-Royce Cars are the Best in the World

"It is no flattery to state that whatever our superiority in the air may be, it is largely owing to the good fortune which led the authorities to select Rolls-Royce Engines for the most important aircraft." *"The Liverpool Courier," March 14, 1918.*

NAVAL and MILITARY · AERONAUTICS ·

FROM THE "LONDON GAZETTE."

Admiralty, April 9th.

R.N.A.S.—Flt. Lt. to be Flt. Comdr.—L. D. McKean, June 30th, 1917.

War Office, April 15th.

The following are among the Decorations and Medals awarded by the Allied Powers at various dates to the British Forces for distinguished services rendered during the course of the campaign. The King has given unrestricted permission in all cases to wear the Decorations and Medals in question :—

Conferred by the King of the Belgians.

Croix de Guerre.

77880 2nd Cl. Air. Mech. F. Goodspeed, R.F.C. (Hackney, N.E.)
78272 2nd Class Air Mech. T. F. Goodwin, R.F.C. (Halifax, Yorks).
5293 Serjt. (Flt. Serjt.) A. J. Graham, R.F.C. (Tetbury, Gloucestershire).
98931 Cpl. G. Holmes, R.F.C. (Yeovil).
7890 Cpl. A. R. Jackson, R.F.C. (West Norwood, S.E.)
6413 Cpl. J. O. Jones, R.F.C. (Llandudno).
8506 1st Cl. Air Mech. S. O. Kelly, R.F.C. (Cahir, Co. Tipperary).
21306 Flt. Serjt. L. C. King, R.F.C. (Devizes, Wilts.).
6188 Cpl. R. E. Knight, R.F.C. (Birmingham).
9922 1st Cl. Air Mech. W. F. Lange, R.F.C. (Westminster).
2410 Serjt. C. Lewis, R.F.C. (Merthyr Tydvil, Glamorgan).
14796 1st Cl. Air Mech. (actg. Cpl.) J. A. Macdonald, R.F.C. (Dumfries).
106099 2nd Cl. Air Mech. J. McMechan, R.F.C. (Horwich, Lancashire).
106809 Cpl. W. Metson, R.F.C. (Brentwood, Essex).
9856 1st Cl. Air Mech. H. W. Moore, R.F.C. (Devonport).
8216 1st Cl. Air Mech. R. C. Platford, R.F.C. (Edmonton, N.E.).
2290 Serjt. (Flt. Serjt.) S. Potts, R.F.C. (Whickham, Durham).
4916 1st Cl. Air Mech. (actg. Cpl.) J. Reardon, R.F.C. (Stepney, E.).
6372 Cpl. F. Spencer, R.F.C. (Oswestry, Salop).
7916 Serjt. (Flt. Serjt.) F. W. Stroud, R.F.C. (Woking, Surrey).
8755 Cpl. (actg. Serjt.) G. R. Sykes, R.F.C. (Barnet).
44986 Sec. Cl. Air Mech. F. J. Tingey, R.F.C. (Forest Gate, Essex).
77881 Sec. Cl. Air Mech. W. Titchmarsh, R.F.C. (Ealing, W.).
4492 1st Cl. Air Mech. C. H. Topps, R.F.C. (Cirencester, Gloucestershire).
5521 Cpl. G. Whitehead, R.F.C. (Manchester).
61929 1st Cl. Air Mech. W. Wilkes, R.F.C. (Walsall).

War Office, April 16th.

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing. Wing Comdr.—Lt. (temp. Maj.) E. L. Conran, M.C., Lrs., from Sqdn. Comdr., and to be temp. Lt.-Col. while so empld. (March 30th).

Air Ministry, April 16th.

R.A.F.—The following appointments are made at the Air Ministry :—

S.O., 2nd Class.—Lt. J. B. F. Watson, and to be temp. Maj. while so empld. (April 1st).

S.O., 3rd Class (and to be temp. Capt. while so empld.) :—Lt. (Hon. Capt.) W. P. Nicholls, Sec. Lt. H. M. Piper (April 1st).

Flying Branch.—Maj. F. F. Minchin, M.C., to be temp. Lt.-Col. while empld. as Wing Comdr. (April 5th, seny. April 1st).

Lt. (temp. Capt.) K. R. Park, M.C., to be temp. Maj. while commanding sqdn. (April 9th).

To be be temp. Capt. while commanding a Flight.—Lt. N. Crompton (April 1st); Sec. Lt. C. F. King (April 5th); Lt. J. Hutchings (April 7th); Lt. N. Comper, Lt. A. W. Beauchamp-Proctor, Lt. H. F. Davison (April 8th); Sec. Lt. R. S. Bell to be temp. Lt. while so empld. as Balloon Comdr. (April 1st).

Administrative Branch.—H. W. Davies is granted a temp. commission as Maj. (April 15th).

L. J. Robertson (Capt., R. Defence Force) to be temp. Capt. while empld. as Courts-Martial Officer (April 1st).

Lt. C. E. Bagram to be temp. Capt. while empld. as Courts-Martial Officer (April 2nd).

Sec. Lt. J. F. Hewitt relinquishes his commission on account of ill-health contracted on active service (April 17th).

The following resign their commissions :—Lt. W. MacLanachan, to resume his medical studies; Sec. Lt. (Qrmr. and Hon. Maj., ret pay) A. Beattie; Sec. Lt. J. H. Higginbottom (April 17th).

Admiralty, April 17th.

The King has been pleased to approve of the award of the following decoration for services in action with enemy submarines :—

The Distinguished Service Cross.

Flt. Lt. H. L. Nunn, R.N.A.S.

The King has been pleased to approve of the award of the following decorations and medals to officers and men of the Royal Naval Air Service :—

The Distinguished Service Cross.

Flt. Lt. (Actg. Flt. Comdr.) C. B. Ridley, R.N.A.S.

For distinguished services as a pilot and for courage in low-flying expeditions during which he attacked enemy trenches with machine-gun fire from a height of 30 feet. On March 9th, 1918, he attacked a formation of enemy scouts, selecting one which was attacking one of our machines. The enemy aircraft dived down with a quantity of smoke issuing from it, but appeared to flatten out at 2,000 feet and disappeared in the mist. He has previously destroyed several enemy machines, and has at all times led his flight with great skill and courage.

Actg. Flt. Comdr. C. F. Brewerton, R.N.A.S., and Flt. Obsr. H. A. Furniss, R.N.A.S.

For skill and courage displayed by them in carrying out many long and valuable photographic reconnaissances over enemy territory, particularly over Ostende, on February 21st, 1918.

Flt. Lt. B. A. Millson, R.N.A.S.

For the skill and courage displayed by him in carrying out two successful bombing raids on Bruges Docks on the night of February 17th-18th, 1918. This officer has taken part in many night bombing raids.

Flt. Lt. J. de C. Paynter, R.N.A.S.

For good work performed by him during a bombing attack on Ostende Seaplane Base on March 3rd, 1918, carried out in spite of very adverse weather conditions. He has shown great zeal and courage as a fighting pilot, having destroyed several enemy machines, and been twice wounded in aerial combats.

Flt. Lt. F. G. Horstman, R.N.A.S.

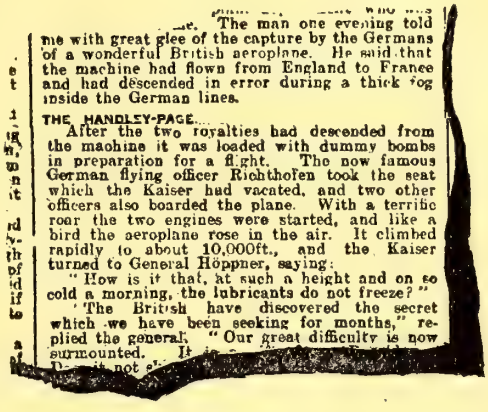
For good services rendered in a bombing attack on Ostende Seaplane Base on March 3rd, 1918, when many direct hits were made. The raid was carried out in spite of very adverse weather conditions. He has also shown skill and courage as a fighting pilot during many engagements with the enemy.

Flt. Sub-Lt. M. H. Findlay, R.N.A.S.

For the courage and daring displayed by him as a pilot. On March 8th, 1918, whilst on patrol, he engaged an Albatros scout, firing effectively from very close range. The enemy aircraft went down completely out of control. He has also destroyed or driven down out of control many other enemy machines.

Flt. Sub-Lt. J. M. Mason, R.N.A.S.

For consistently good work performed in the course of numerous bombing raids on enemy aerodromes. On Feb. 18th, 1918, he obtained a direct hit on a shed of the Varssenaere Aerodrome. On the return journey, during a fight with enemy aircraft, his control wire was shot away, but he succeeded in safely landing his machine.



A British Firm beats the Germans

KAISER (loq.): "How is it at such a height on so cold a morning the lubricants do not freeze."

GEN. HÖPPNER: "The British have discovered the secret which we have been seeking for months."

Vide "DAILY MAIL," see above.

The man one evening told me with great glee of the capture by the Germans of a wonderful British aeroplane. He said that the machine had flown from England to France and had descended in error during a thick fog inside the German lines.

THE HANDLEY-PAGE.

After the two royalties had descended from the machine it was loaded with dummy bombs in preparation for a flight. The now famous German flying officer Richthofen took the seat which the Kaiser had vacated, and two other officers also boarded the plane. With a terrific roar the two engines were started, and like a bird the aeroplane rose in the air. It climbed rapidly to about 10,000ft., and the Kaiser turned to General Höppner, saying:

"How is it that, at such a height and on so cold a morning, the lubricants do not freeze?"

'The British have discovered the secret which we have been seeking for months," replied the general. "Our great difficulty is now surmounted. It is [illegible] not s[illegible]

Extract from "Life in Essen."
Eye-Witness's Account, "Daily Mail," April 8/18.

THE SECRET.

WAKEFIELD Castrol MOTOR OIL "R" (Racing)

was the lubricant used

Castrol "R" possesses the lowest cold test of any known Aero Engine Oil.

C. C. WAKEFIELD & Co., LTD.
WAKEFIELD HOUSE, CHEAPSIDE, LONDON, E.C. 2.

C.D.C.

Flt. Sub-Lt. T. A. Warne-Browne, R.N.A.S., and Obsr. Sub-Lt. T. S. Russell, R.N.A.S.

For the skill and determination displayed by them on March 18th, 1918, when carrying out a reconnaissance over Bruges and Blankenberghe under heavy anti-aircraft fire. Both these officers have taken part in many reconnaissances over the enemy's lines, often in face of heavy anti-aircraft fire and attacks by hostile aircraft, and have always displayed great gallantry and determination.

Obsr. Sub-Lt. F. H. Stringer, R.N.A.S.

For the zeal and ability shown by him as observer in many daylight bombing attacks over enemy territory, especially on Feb. 26th, 1918, when a direct hit was made on Engel Dump.

Bar to the Distinguished Service Cross

Flt. Comdr. C. H. Darley, D.S.C., R.N.A.S.

For zeal and determination in carrying out numerous night bombing raids on enemy aerodromes, docks, etc. On the night of Feb. 18th-19th, 1918, he carried out two attacks on the St. Denis Westrem Aerodrome.

Flt. Lt. V. E. Sieveking, D.S.C., R.N.A.S.

For the skill and determination in attacking enemy aerodromes, docks, etc., with bombs. On the night of Feb. 17th-18th, 1918, he carried out two bombing attacks on Bruges Docks, and on the following night he again carried out two attacks, one on St. Denis Westrem Aerodrome and one on Bruges Docks. His zeal and determination cannot be too highly praised.

Flt. Lt. S. W. Rosevear, D.S.C., R.N.A.S.

For the skill and gallantry displayed by him on March 15th, 1918, when he attacked a formation of eight enemy aircraft, destroying two of the enemy machines. This officer has destroyed numerous enemy machines, and is a very skilful and dashing fighting pilot.

A Second Bar to the Distinguished Service Cross.

Actg. Flt. Comdr. R. P. Minifie, D.S.C., R.N.A.S.

For courage and daring in the face of the enemy, particularly on March 13th, 1918. On that date, when on patrol with four machines, he attacked an enemy patrol of five scouts, destroying two, whilst a third was destroyed by another officer. Actg. Flt. Comdr. Minifie has now destroyed numerous hostile machines.

The Distinguished Service Medal.

P.O. A. Clark, O.N. 234540 (Po.); Air Mech., 1st Gr., W. Taylor, O.N. F14/6.

* * *

The following decorations have been conferred by the Allied Powers on officers of the British Naval Forces for distinguished services rendered during the war. The King has given unrestricted permission to the officers concerned to wear the decorations in question :—

Conferred by the President of the French Republic.

The Croix de Guerre.

Wing-Comdr. C. H. K. Edmonds, D.S.O., R.N.A.S

Sqdn.-Comdr. C. W. H. Pulford, R.N.A.S.

Conferred by the King of the Hellenes.

The Order of the Redeemer.

Commander.

Sqdn. Comdr. R. J. Bone, D.S.O., R.N.A.S.

War Office, April 17th.

REGULAR FORCES—Staff—Attached to Headquarter Units.—Brig. Maj.—Lt. (temp. Capt.) T. M. Eggan, Lond. R., T.F., and R.F.C., to remain secd., and to retain his temp. rank while so empld. (March 1st).

Staff Capt.—Temp. Maj. the Rt. Hon. Sir J. A. Simon, K.C.V.O., relinquishes his appt. (Jan. 29th).

Establishments.—R.F.C.—Mil. Wing. — Special Appt.—Graded as a Sqdn. Comdr.—Lt. (temp. Capt.) E. Selby, Spec. Res., a Flt. Comdr., and to be temp. Maj. while so empld. (March 20th).

Flt. Comdrs.—From Flying Officers, and to be temp. Capts. while so empld.—Temp. Sec. Lt. E. T. Simpson, Gen. List (March 24th); temp. Sec. Lt. H. N. C. Robinson, Gen. List (March 28th).

Adjt.—Temp. Maj. E. W. H. Kennedy, Garr. Bn., Hamps. R., and to be transfd. to R.F.C. Gen. List (Dec. 6th, 1917).

Equipt. Officers, 1st Cl.—Sec. Lt. (temp. Capt.) C. Porri, Yeo., T.F., from an Experimental Officer, 1st Cl. (graded as an Equipt. Officer, 1st Cl.), and to retain his temp. rank while so empld. (March 6th, seny. Oct. 1st, 1916).

Schools of Instrn.—School of Photography.—Comdt.—Graded as a Park Comdr.—Lt. (temp. Capt.) P. R. Burchall, Spec. Res., an Equipt. Officer, 1st Cl., and to be temp. Maj. while so empld. (March 10th).

Memoranda.—To be temp. Lts. (without the pay or allowances of that rank) while empld. as Asst. Insprs., Aeronautical Inspn. Dept.—Temp. Sec. Lt. N. Lee (Nov. 5th, 1917); Sec. Lt. A. E. Joyce, Res. of Officers (Nov. 15th, 1917).

War Office, April 18th.

REGULAR FORCES—Memoranda.—To be temp. Hon. Lt.:—Cpl. B. C. Hawkridge, from R.F.C., while empld. as Asst. Inspr., Dept. of Aircraft Production, Nov. 1st, 1917.

* * *

The following Medals have been awarded by the President of the French Republic at various dates to the British Forces for distinguished services rendered during the course of the campaign. The King has given unrestricted permission in all cases to wear the Medals in question :—

Croix de Guerre.

Maj. (temp. Brig.-Gen.) J. H. W. Becke, D.S.O., Notts and Derby R.; Temp. Lt. A. F. Britton, M.C., R.F.C.

The Design and Construction of Internal Combustion Engines, with special reference to Aero Engines.—IV.

BY C. SYLVESTER.
Author of "The Conversion of Electrical Machinery," "Testing Motors and Motor Starters," etc., etc.

Cylinder Design.

The cylinder, cylinder head, and the piston are the three portions of an engine that are subjected to combustion pressure and very severe heat stresses at the same time. It is therefore essential that considerable care should be expended on these important parts.

Before commencing the design it must be realised that the cylinder must be capable of withstanding the strains due to:—

1. Stresses due to the variation in the temperature of the combustion in the cylinder head, and the cooling water outside the cylinder walls.
2. The enormous stresses due to the pressure of the combustion of the working fluids.
3. All stresses which emanate from the load on the piston and which are transmitted from the cylinder head to the base of the engine, either direct through the cylinder itself or by means of studs fixed from the cylinder head to the base.

Of the above, the first item is the most important, but it may safely be said that there is no known method of calculating the stresses due to the rapid transmission of heat. The most efficient design of cylinder has only been arrived at through practical experience.

Types of Cylinders.

There are several types of cylinders in use at the present time, each varying from the other in design and construction.

Air-cooled cylinders usually have the cylinder and head cast in one piece.

Some types of water-cooled engines have the cylinder, cylinder head, and water jacket in two castings, the cylinder and head forming one casting.

The latest types of aero-engine have cylinders, water jackets, and cylinder heads in three independent portions. In these the cylinder proper is a cast-iron or steel sleeve to take the piston-wear fitted inside a jacket of aluminium or other metal. Thus sleeve abuts on the cylinder head, or fits into it, as well as in the jacket casting.

Cylinder Sleeves.

The method of fixing the sleeve into the cylinder head is a matter of choice rather than design. Some sleeves are satisfactory if neatly fitted, others are screwed and are equally satisfactory.

If either method is adopted it must be remembered that the work must be absolutely accurate and sound; if it is not, then trouble will be the result due to the axial and radial stresses caused by the explosion which are shared by the cylinder jacket and the liner.

Points in Design.

Two points should be carefully observed when designing a cylinder.

1. Any abrupt variation in the thickness of the material should be avoided. A good example of this is the flange at the base of a cylinder sleeve, Fig 8. In this diagram one side of the base of a cylinder is shown in section. Here, A is good practice, B is not correct, C shows the actual section of a well-known type of cylinder. The material is steel.
2. Suitable allowances should be made for the unequal expansion and contraction of the cylinder and water jacket walls. In aero-engines this is much more simple than when dealing with a large power oil engine, where, in addition to mechanical strength, allowances have to be made for the subsequent boring of the cylinder. With aero-engines the factor of safety of the material can be approached with certainty, because the maximum thickness of the material is the minimum thickness, and vice versa.

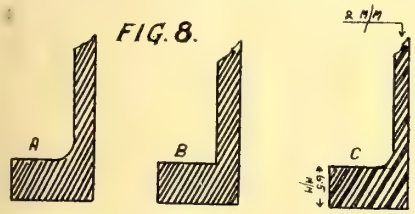

FIG. 8.

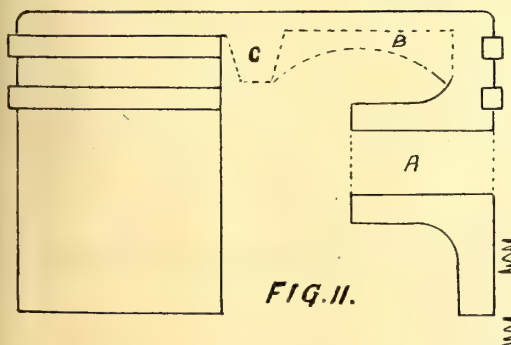

FIG. 11.

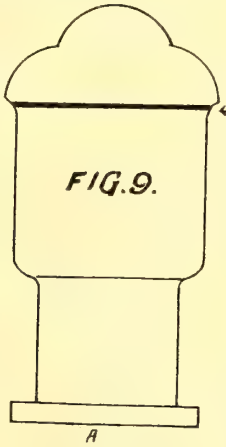

FIG. 9.

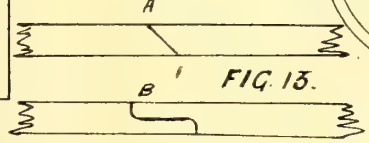

FIG. 13.

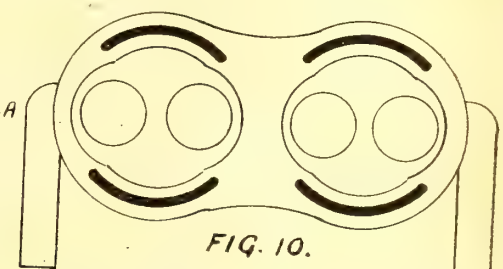

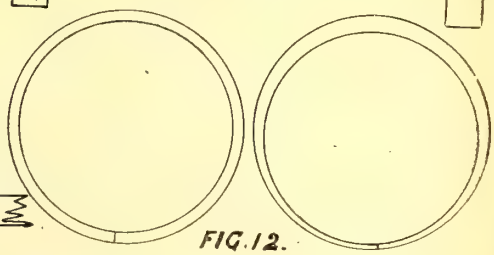

FIG. 10.

FIG. 12.

Modern Practice.

An illustration of the type of cylinder used in a modern engine of 140 B.H.P. aero-engine is shown in Fig. 9. This diagram shows one cylinder only of a recent American engine, but the cylinders are actually cast in pairs from an aluminium alloy, and they are provided with steel sleeves carefully fitted into each cylinder. Perfect contact is secured between the cylinder and sleeve.

No difficulties due to expansion occur in spite of the rapid transmission of heat and the fact that the sleeve is always at a higher temperature than the jacket cylinder.

A moulded copper asbestos gasket, A, is placed between the cylinder and the head, thus permitting the cooling water to circulate freely and at the same time ensuring a tight joint.

The cylinder heads are also cast in pairs from an aluminium alloy, and they contain ample water-passages for the circulation of cooling water over the entire head. Trouble due to hot valves is thereby eliminated, a most important consideration in the operation of designing an aero-engine.

The water-jacket of the head corresponds to the water-jacket of the cylinder, and large openings in both allow the unobstructed circulation of the cooling water.

Fig. 10 illustrates the plan of the cylinder head. In this diagram the inlet and exhaust valves are shown. The thick curved lines indicate the inlet and outlet for the cooling water.

Piston Design.

The design of a piston depends upon the type and power of the engine in which it is to be used. Water-cooled pistons are extensively used in large power Diesel and oil engines. This method cannot be adopted for aero-engines, at any rate at present, so we will consider piston design from an aero-engine point of view only.

As with all aero-engine parts the minimum weight, combined with efficiency, is the first consideration. This being so, it is generally understood that aluminium, as an alloy with zinc, being very light and strong is a suitable material for the construction of pistons.

Experience has taught us that this alloy has given every satisfaction, but it must be pointed out that a designer is very apt to err both from an economical and efficiency point of view if he depends upon this alloy in every instance. By this it is meant that, although an aluminium alloy has proved to be satisfactory for the construction of a piston, there must be a sufficient quantity of this alloy used to give it the necessary mechanical strength.

A Personal Opinion.

In the writer's personal opinion, it would probably be cheaper, quite as efficient, and the weight would not be increased if a metal or alloy other than aluminium were used

This appears to be the opinion also of the Beardmore Aero Engine Co., Ltd., who make the pistons in their engines of special steel. Owing to its great toughness they are extraordinarily light, the wall being only 1 mm. thick.

The Other View.

The American engine mentioned is fitted with pistons made from a special aluminium alloy. They are deeply ribbed in the head for cooling and strength, and they are provided with two piston rings. Such a piston is illustrated in Fig. 11.

In this diagram A is one of the gudgeon-pin bearings, B is one of the ribs, and C is the cross section of the rib which crosses B at right angles.

Piston Lengths.

The length of a piston chiefly depends upon the thrust of the connecting rod at right angles to the centre line of the piston. It is fairly safe to assume, however, that if twice the distance from the centre of the gudgeon-pin to the top of the piston be allowed for total length, the design is correct. That is, if the distance from the centre of the pin to the top of the piston is two inches, then the total length will be four inches.

To give the student a good idea of an excellent design of piston, I quote the piston details of a well-known water-cooled aero engine.

Diameter of piston at top	... ...	141.2 mm.
Maximum clearance in cylinder	... ...	.035 in.
Minimum clearance in cylinder	... ...	.029 in.
Diameter of piston at bottom	... ...	141.6 mm.
Maximum clearance in cylinder	... ...	.018 in.
Minimum clearance in cylinder	... ...	.014 in.

From the above details it will be seen that both the clearances and limits are very fine.

Piston Ring Design.

The design and manufacture of piston rings is a highly specialised branch of motor engineering. A perfect piston ring is one that has a high tensile strength, and a high elasticity which will give it a maximum life and springiness without fear of breakage through brittleness.

Care should be taken that the composition of the material used should contain the proper combination of elements to give a minimum permanent set, wear, or deterioration in any way under cylinder heat. Thus the casting temperatures should be determined by pyrometer, the hygroscopic nature of the sand, and the rate of cooling noted as affecting chill, and so on.

Concentric Rings.

The advantage the concentric type of ring possesses over the eccentric type is that, being of similar cross section all round, there is no tendency to wear the grooves unevenly, neither is there a space behind the ring for the deposition of carbon.

One of the chief difficulties in the construction of concentric rings is to obtain a uniform pressure all round when they are in position in the cylinder. The British Chuck and Piston Ring Company guarantee to produce rings that are a perfect fit, this being facilitated by the use of special automatic hammering machines which give the ring the necessary curve.

In Fig 12 are illustrated both concentric and eccentric rings.

Gap and Pressure.

A perfectly constructed piston ring should have just sufficient spring to make a perfectly gas-tight joint against the pressure of the explosive gases in the cylinder. This spring, or the combined pressure of the rings in the cylinder, should be the minimum required for gas tightness, since friction is roughly proportional to the pressure.

As far as aero-engines are concerned, the number of rings to be used depend upon the type of engine and the area of the cylinder. It is sometimes better to use, say, four rings of fair pressure than two rings which will give high pressure and excessive wear of the cylinder walls.

In aero-engines the average pressure of a ring on a cylinder wall is about 18lbs. per square inch. The ring should be constructed, as far as weight and cross section is concerned, to maintain this pressure without producing undue stresses in the ring.

In some types of engine extra high pressure of the ring on the cylinder wall is essential. In this case it is apparent that the adoption of a cast-iron ring would not be satisfactory, since it is not possible to obtain more than 18 tons per square inch tensile. A ring is therefore used which is manufactured from high speed steel, which has about three times the modulus of elasticity of cast iron. That is to say, a cast-iron ring with dimensions identical to such a steel ring would exert but one third the pressure on the cylinder walls, as compared with the steel piston ring.

Ring Joints.

Many designs are brought forward from time to time concerning this important subject, but one is of the opinion that it is not so much the design of the joint as the actual fitting that ensures efficiency. Leakage, past any pattern joint, if well fitted, is negligible.

For our purpose in this article we will consider two pattern joints only. One is known as the "scarf," the other as the "lap." These joints are illustrated in Fig. 13 where A is the scarf and B the lap joint. Special attention is drawn to B, where the lap should be as short as possible and radii left in corner for strength.

(To be continued.)

WOMEN PILOTS.

The following advertisement appeared recently:—

Ladies' Flying School.—Those interested in this and with capital of not less than £500 to £1,000 are invited to write to Box L.569, the "Times."

It is to be hoped that any readers of this paper who are asked to advise on this proposition will advise against it. No doubt in time to come women aviators will be numerous, but in war time there is no place for them. All available aerodrome space, engines, aeroplanes, mechanics, and petrol are required for the training of war pilots.

It has been suggested that women would be useful as "ferry pilots" to take Service machines from place to place in Great Britain or behind the lines in France. There is, in fact, no need for them. There are plenty of war-worn pilots who are fit for the job and for very little else. These men have already been trained to fly at great expense, so there is no reason to spend more money on training women for the same work. The fact that the advertisement asks for capital in such small amounts as £500 lots seems to indicate that the scheme is financially unsound at the very start, and anyone who may be asked to participate in it will be well advised to give it a wide berth.

THE AERIAL POST.

In response to inquiries the Postmaster-General states that it is not proposed to establish an experimental postal aerial service in this country at present, as the whole resources of the aeroplane industry are required for military purposes.

[It is rather a pity that some of the perfectly usable aeroplanes, which are just too out-of-date for military work, cannot be used for the experiment. At present there are hundreds of them rotting in stores all over the country, and they will ultimately have to be burned. They might just as well be used now.—Ed.]

The Curtiss Flying Boat Patent.

Considerable importance attaches to the patent on flying boats recently granted to Mr. Glenn H. Curtiss. Many other designers of flying boats will, in due course, arrive at the same conclusions as Mr. Curtiss, and it will therefore be as well for them to study the following particulars carefully, so as to avoid infringements.

There is a certain interest concerning this boat, as it is obviously the result of the experiments made, along with Mr. Curtiss, by Lieut. John Porte, R.N., before the war. It is fair to assume that it was for services thus rendered that Mr. Curtiss gave Lieut. Porte that interest in the consequent sales of these boats, which entailed his coming into so much money as the result of the boat's success that the British Government became covetous, and compelled him by legal pressure to "return" to the Treasury some thousands of pounds which never belonged to it.

The patent reads as follows :—

The United States Patent Office granted on February 19th, 1918, the claims made in an application filed on December 11th, 1914, by Mr. Glenn H. Curtiss, of Hammondsport, N.Y., in behalf of a patent covering the construction of stepped and V-bottomed flying boat hulls. The patent, No. 1,256,878, is specified by the patentee as follows :—

My invention relates to hydroplane boats of the type commonly used in connection with hydro-aeroplanes of the flying boat type. It has for its objects the enabling of the craft to rise quickly from the water with maximum load aboard and having risen from the water to enable operation in the air with a minimum of head resistance due to the body of the boat. To these ends the main flotation body of the boat is given a longitudinal section of approximately streamline form, and a transverse section increasing in size from the head of the boat to a maximum approximately one-third length astern, and thereafter gradually decreasing in cross section until the tail of the boat is reached. This cross section is approximately the shape of an ellipse with one or both ends or sides cut off to form the bottom of the boat, or the top thereof, as the case may be. Further I decrease the minor axis of the ellipse more rapidly than the major axis as the cross section is decreased in the immediate vicinity of the tail of the boat, so that the section becomes substantially a straight line terminating in the vertical rudder post. Previous to this, the separate axes are independently varied in the rearward progression of adjacent cross sections, to obtain the streamlines with which the boat is characterised, and to bring out to the fullest extent the features of efficiency above enumerated. The bottom of the boat is stepped and the front portion thereof constitutes the active hydroplaning surfaces,

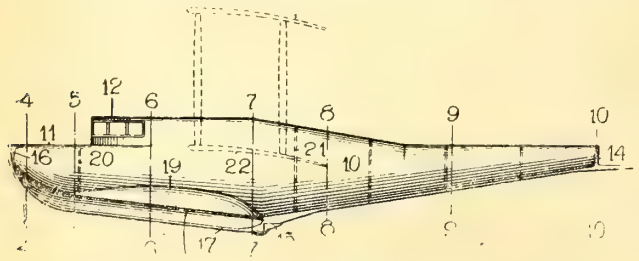

Fig. 1.

while the rear portion thereof underlying the tail proper makes a salient angle therewith. Preferably the hydroplaning bottom is V-shaped. On the sides of the boat are formed excrescent structures the bottoms of which are in continuation of the hydroplaning bottom of the boat, and the longitudinal section of which is of streamline form. Preferably these excrescent structures are watertight, and are of an approximately triangular section.

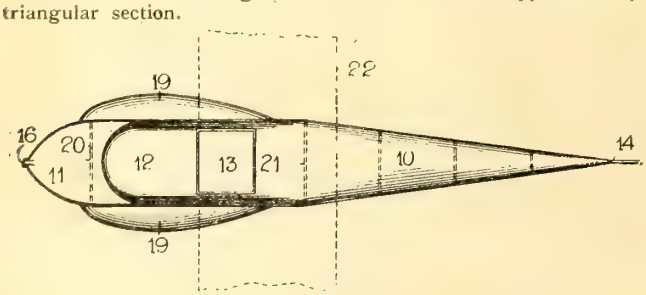

Fig. 2.

In the accompanying drawings, I show one embodiment of my invention but wish it understood that, as usual in the case of an invention of this character, my invention is capable of many other embodiments without departing in any wise from its generic spirit.

Of the drawings Figure 1 is a side-elevation of the boat of my invention,

Fig. 2 is a plan thereof,

Fig. 3 is a front elevation thereof showing aerial supporting surfaces attached, and

Figs. 4 to 10 inclusive are transverse sections on lines 4 to 10 of Fig. 1.

10 designates the flotation body of the boat. As clearly indicated in the side elevation and plan of Figs. 1 and 2 this

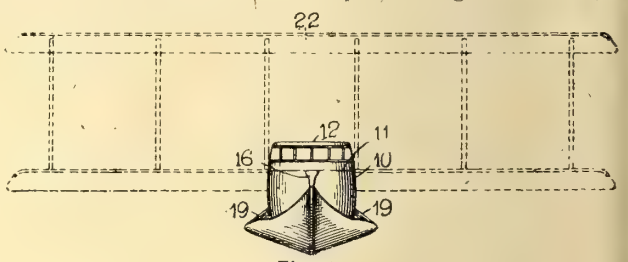

Fig. 3.

body has a longitudinal section approximately streamline in form. There are a few slight irregularities in its surface, but these are insufficient to detract from the behaviour of the boat in air as a streamline body. The principal variation is at the head or prow of the boat, where the top is cut straight back on the line 11 to form a front deck, and give unobstructed vision from the cabin 12. To complete the elevational streamline the cabin roof line would naturally be downwardly curved to round off into a substantially elliptical juncture with the nose. This forward elevational streamline, however, is interrupted by the provision of the fore deck 11 which extends horizontally and rearwardly to an intersection with the cabin, a cockpit being provided at the intersection of this deck with the cabin and a conning top having windows set therein being furnished to inclose this cockpit and to round off the interrupted lines of the cabin forwardly. The side and top walls of the cabin merge into the streamline of the body aft as indicated in Fig. 1. Entrance to the cabin is by a hatch door 13 in the top and preferably located beneath the upper aerial supporting surface whereby it is shielded from the weather.

The transverse section of the body of the boat is in the form of an ellipse cut away in some cases at opposite ends of an axis and in other cases at one end only. The section at the front of the boat, as clearly shown in Figs. 4 to 7, is in the form of an ellipse cut away at each end of an axis, while the section at the tail of the boat as shown in Figs. 8 to 10 is in the form of an ellipse cut away at lower end of one axis only. In the form shown this axis is the major axis, all of the major axes lying in the longitudinal vertical plane of the body. The cross section increases gradually to a maximum approximately one-third way astern, and thereafter decreases gradually. Both axes decrease proportionately for a part of the rearward distance traversed, then the major axis is shortened at the more rapid rate and finally the decrease of the

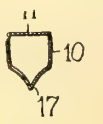

Fig 4

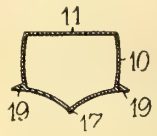

Fig 5

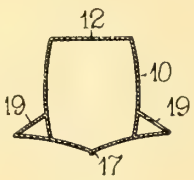

Fig 6

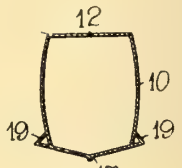

Fig. 7

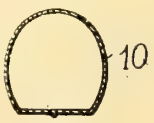

Fig. 8

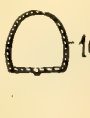

Fig 9

Fig. 10

minor axis of the elliptical section is made more rapidly than that of the major axis. These three successive stages clearly appear from inspection and comparison of Figs. 7-8, Figs. 8-9 and Figs. 9-10 respectively, the elliptical section eventually becoming a straight line in the rudder post 14. In other words the transverse section may be described as varyingly elliptical,

the size of the ellipse (rearwardly from the prow) passing through successive stages in which (a) the major axis increases rearwardly more rapidly than the minor axis (b) both axes decreasing rearwardly, and (c) the minor axis decreases at a more rapid rate than the major axis, the said sectional ellipses terminating in a straight line at the rudder post.

The bottom of the boat is stepped as indicated at 15 (Fig. 1). The front portion thereof is of V section the angularity of which increases gradually from the stem 16 to the step 15 as indicated clearly in Figs. 4 to 7. Also it will be observed there is an abruptly increasing and then a gradually decreasing concavity of the opposite sides of the V-bottom merging into the substantially flat salient surfaces at the step 15. It will be observed, however, that this concavity is not great in any case, and further that the downward and rearward inclination of the bottom at the keel 17 is substantially the same as that at the chimes 18, excepting at the upwardly inclined prow of the boat which portion of course has no hydroplaning function.

Projecting laterally from the sides of the flotation body 10 at or near the chine lines 18 are elongated excrescent structures 19. These structures have an approximately streamline form as clearly appears from Figs. 1 and 2. Transversely they are of approximately triangular and varying cross section, one side of the said section being in continuation of the transverse section of the bottom of the boat (see Figs. 6 and 7), whereby their under surfaces constitute continuations of the main hydroplaning surfaces, another side conjoining the sides of the main body 10, and the third side extending downwardly and laterally therefrom. Considering the conjoint sides of the hull and fin excrescences as identical, as is usually the preferable construction, it will be observed that the fins in cross section then become of an acute V-shape, one side of the V lying in the plane of the bottom and the other side intersecting therewith from the hull. These excrescent structures 19 are made watertight independently of the main body 10 and in the embodiment shown are each hermetically sealed. The two structures 19 and the front portion of the main body 10 make a total of three longitudinally extending watertight compartments. The front portion of the main body 10 is further transversely subdivided into watertight compartments as indicated by the dotted line bulkhead 20. The tail portion of the boat is also divided into watertight compartments by transversely extending bulkheads 21.

Aerial supporting surfaces 22 extend laterally from the body 10 as indicated. In the preferred form of my invention, there are provided a multiple number of these surfaces in superposed relation constituting the cell of a biplane or triplane as the case may be.

The fins 18, it will be observed, extend considerably beyond the centre of the wings and therefore the hydroplaning area and lift is augmented in the neighbourhood of the centre of gravity and centre of pressure as it should be. This location of the fins 18, although most effective after having gained the surface of the water, is of little importance in gaining this end. More important is it that the fins should be located in the vicinity of the resultant centre of hydroplane lift so that the hydroplane lift will be increased at the point where it is most needed to be increased and at a point providing for quick rise from a submerged position at rest to a hydroplaning position upon the surface of the water at speed. The great advantage in so locating the fins is that the enormous thrust value occasioned by the elevated location of the motor or motors (not shown) is offset and the boat prevented from nosing under when coming to a hydroplaning position and when hydroplaning —especially when travelling at comparatively slow speed. In explanation, it is to be noted that three working forces are in evidence, to wit: gravity, thrust and hydroplane lift. Unless the hydroplane lift is sufficient to counteract the force of thrust, then the boat will have a tendency to plane with its nose low in the water. Were the fin excrescences omitted, the size of the fore body of the hull would have to be materially increased so that the hydroplaning area might be proportionately enlarged. This is objectionable because of the added weight and increased resistance during flight. The resultant centre of hydroplane lift is shown by calculation to lie approximately one-third back of the forward end of the hydroplaning surface.

With this understanding of the structural embodiment of my invention, it will be clear that I have attained the objects thereof. The extended and very large hydroplaning surfaces provided by the bottoms of the excrescent structure 19 in conjunction with the main body 10 are of sufficient size to enable the body to come rapidly to its hydroplaning position, and to rise from that position into the air with maximum load. In a recent trial, over a ton of useful load was lifted from the water in a run upon the surface not exceeding five hundred feet. The flying boat took to the air with great ease. As the head of the boat is pointed upwardly for the craft to take to the air, the tail, which until then is clear or substantially clear of the water, is carried downwardly into contact therewith, the boat being as it were rocked about the step 15 as a pivot. This assists in enabling the boat to rise easily from the surface of the water by reason of the increased flotation and additional planning surface provided at the critical point in the operation. When the craft is in the air, the longitudinal streamline formation of the excrescences 18 prevents them from materially increasing the head resistance of the boat. Under actual flying conditions it was found that they produced no noticeable retarding effect. Of course the longitudinal streamline section of the body as a whole is productive of the same excellent results obtained in prior flying boats of my invention.

While on the surface of the water, or in the air for that matter, the operator has an excellent footing on the flat deck 11 and its form and location are especially adapted for the mounting and operation of machine guns for military purposes. The operator further has at all times unobstructed vision ahead directly over the flat deck 11, which forwardly mutilates the generating boat line of the cabin which would normally round off into the nose of the body.

The sealing of the excrescent structures 18 independently of the main body 10 gives to them the additional and very important function of watertight compartments. They are located at a point where these compartments are very much needed, directly opposite the cabin 12. It is of course not practicable to seal the cabin section. The flotation of this section of the boat is thereby materially raised and is assuredly of sufficient value under all conditions of service.

[The Claims mentioned will be published next week.—Ed.]

"RESEARCH"—A FOOTNOTE.

I am glad to see that my recent articles in The Aeroplane on the subject of joint research seem to have attracted some attention, but I am sorry to have to admit that, judging by letters that I have received, my intentions in writing the articles in question were not made sufficiently plain.

What I was trying to advocate was not merely joint research by a group of inventors financed, let us say, by a syndicate and intending to make their results the subjects of patents out of which they and they alone would benefit.

What I hope to see is a Research Association comprising every firm worth mentioning in the Aircraft Industry and producing results which should be open to every member of that Industry to utilise to the best advantage without licence or payment of royalty.

This is the way to get the biggest result for the British Industry as a whole for any given expenditure of money. If an invention is devised by one man who possesses the sole rights in it, then its general utility is only one-fiftieth of what it would be if the same invention and all that led up to it were open and free to fifty firms.

On the score of cost, we have also to remember that real joint research by industries will be largely financed by the Government, whereas private syndicates will have to stand all their own costs. Some of the people who have written to me seem to pooh-pooh the idea of Government help. Perhaps because it seems to be too good to be true. Perhaps because the schemes they themselves have in mind are such that no sane Government would assist them.

The fact remains that, subject to control by responsible manufacturers who will not waste their money on mad projects, the Government will really put up substantial funds to assist in the discovery of new inventions and improvements.

Broadly speaking, means of communication can be divided into two groups. One group comprises all the ideas that can be usefully applied in ordinary civil life and that may also be very valuable in war. These include railways, motor vehicles, ships, telegraphy, and so on.

The other class of communication is that which merely enables the man who possesses it to make himself felt upon the person of his enemy at a distance. The gun in its various forms is the most obvious example, but the class includes also more primitive weapons, such as the bow-and-arrow and sling.

Man, and particularly so-called civilised man, has the advantage over other animals merely in his possession and control of means of communication. He can get himself conveyed rapidly from point to point on land or water and through the air. He can shift his goods rapidly, and he can hit his enemy from a distance before his enemy can hit back.

At the present moment the fate of the aeroplane hangs in the balance. With which group of means of communication is it to be classed?

From the manufacturing point of view, will it mean a steadily growing industry on a firm foundation, or only a war industry for which large national arsenals must be mainly responsible?

What we have to do is to bring it into the first of these classes. It can be done by expenditure and enterprise, and we cannot be satisfied so long as it is not employed more extensively than the gun, which is the weapon of the soldier and the means of enjoyment of the sportsman.

We can make it far more useful, and the Nation that does so first will get the bulk of the world's business. That is why we want to throw up all schemes of research by syndicates and pool our money and our plans for research by the entire industry.

The "Guardian Angel" Parachutes

THE GUARDIAN ANGEL PARACHUTES TRADE MARK (REGISTERED)

THE CLASS OF OUR LIFE-SAVING EQUIPMENT.

The basic characteristics of our Parachutes, which differentiate them from all others, and for which we have master-patents, are automatic (i.e., compellative) opening, and static and kinetic control (i.e., control at rest and action) of all their component details. The ordinary parachute is under no sort of control, and what we have accomplished is to convert this most insubordinate Apache of the Air into a staid servitor, incapable of acting in any other than the designed way. We have made the Parachute into an automatic machine, so that failure to open and entanglement of rigging has become a physical impossiblity. Every Type of Parachute made by us possesses these paramount and indispensable principles of machine action. The aviator makes his jump, and the Parachute automatically does the rest.

THE RANGE OF OUR LIFE-SAVING EQUIPMENT.

Life-saving Parachutes for school machines on the Training Grounds.

Life-saving Parachutes for heavy bombing machines, fighters, and scouts.

Life-saving Parachutes with minimum weight and without additional air resistance for the fastest machine that flies, and capable of release from any vertical or horizontal angle, or when flying upside down.

Solo-Parachutes for use from Airships and Observation Balloons, with a high but constant-speed initial drop from a fired gas-bag, automatically opening into the low-speed descent required for a safe landing.

Basket-Parachutes for instantly detaching the basket containing two observers, their instruments and records, from a fired gas-bag, with high-speed initial fall, changing automatically to slow-speed descent for the safe landing. Parachute instantly released on landing, to avoid dragging the basket.

Variable-speed Parachutes, to permit a sudden high-speed drop, controlled by the Parachutist, to escape from an enemy aeroplane, and to stop on any portion of the grade of descent to avoid an objectionable landing. This variable-speed apparatus is applicable to the whole range of our Parachutes.

Non-spinning shock-absorber slings, taking all shocks off Parachute and man.

Aviator's Harness, distributing the stresses over those parts of the body best able to sustain them, and instantly releasable when alighting on land, on a roof, in a tree, or in water.

OUR EQUIPMENT IS THE RESULT OF ENGINEERING SCIENCE APPLIED TO DIFFICULT AIR PRORLEMS. WE BELIEVE THAT ITS EXTENDED USE WILL DOUBLE THE FLYING LIFE OF OUR FIGHTERS AT THE FRONT.

SIR JOSEPH JONAS, COLVER & Co., Ltd.

Manufacturers of Steel of every description, including

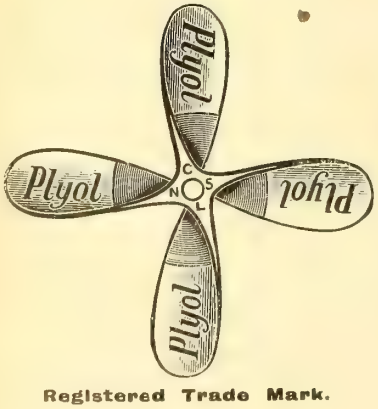
HIGH GRADE NICKEL STEEL & FORGINGS

for Naval and General Marine Purposes.

Special Heat Treated Alloy and other Steels for Aircraft and Automobile Purposes

IMPORTANT SPECIALITIES:

S.S.G. **A SPECIAL NICKEL CHROME GEAR STEEL.**
FOR AIR OR OIL HARDENING. When treated this steel has exceedingly tough properties and is specially suitable for Gear Wheels, Connecting Rods, etc.



S.G.W. **A NICKEL CHROME STEEL IN FOUR GRADES.**
Eminently suitable and strongly recommended for Gears, Crankshafts, and other highly stressed parts, and having exceptional machining qualities. Combines unusually heavy shock-resisting and wearing properties with silent running.

G.P.S. **A HIGH GRADE ALLOY CASE HARDENING STEEL**
for severely strained parts, such as Gear Wheels, Gudgeon Pins, etc.

Continental Steel Works and Novo Steel Works, Sheffield.

The top photo shows a nasty accident to an Aluminium Crank Case of a 160-h.p. Beardmore Aero-Engine.—"Air."

The bottom photo shows how the fractures were repaired and made good by Barimar, the Sir Frederick Treves of the Welding World.—"Air."

AIR, AIR!

Mr. Blin Desbleds, the Editor of "Air," refers in the March issue to Barimar as "the Sir Frederick Treves of the Welding World."

"Air" is the official organ of the Aeronautical Institute of Great Britain, and is at present conducting a vigorous campaign with the object of bringing into use for National Aircraft Construction tens of thousands of partially employed engineers and allied trade workers.

Barimar's object is somewhat similar. Barimar wants to rout out the idle apparatus and machinery that are put away useless until "after the war." Barimar wants to have a shot at welding broken parts that cannot be replaced until "after the war." Barimar wants to help you to run idle machinery to hasten the end of the war.

Barimar has made 25,000 effective repairs during the war period alone, and is willing to do as many more. Nearly all Government Departments patronise Barimar. Barimar is the surgeon for broken metal parts. Anything in the machinery line that is "stalled" through the breakage of a part that cannot be replaced is a good and fit object for Barimar's welding skill.

Barimar gives a guarantee of "money back" if repaired part fails to stand up to working test or strain.

You, reader of this advertisement, need a copy of "The Welding Test." It will show you, in a few seconds, just what can be done by Scientific Welding. If you have some broken parts lying in your dug-out and want them repaired, a copy of "The Welding Test" is yours free by post. If you merely want to see the book, please send 3 penny stamps to pay postage. In either case, be sure you ask for Manual "BC," and that you mention "Aeroplane."

There is an old, overworked motto that applies here—*Do it now.*

A note to the man of action who wants his job done without delay.

Remove all fittings from the broken part, see that a label bearing your name and address is attached, take the job to the passenger station. Always pay the carriage. Write us, giving name of railway, date of dispatch, and your instructions about repair. Simple—but effective.

Address your Repairs to Dept. "B.C."—

BELLING ELECTRIC GLUE POTS

for Aeroplane and other work

List No. 38.
Price 32/-
(Spare Elements 3/6 each)

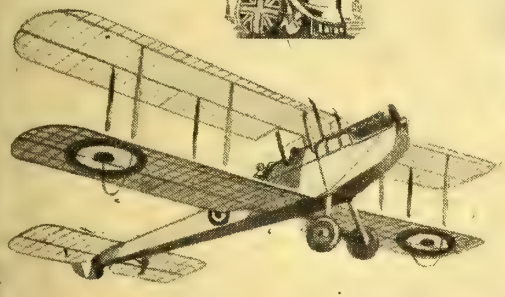
Strongly made in cast iron, the Glue container being tinned.
CAPACITY: 2 pints of glue.
LOADING: 900 watts.
3 elements, 3 heats, 3 loose connectors for attaching the cable to.
WEIGHT: 14 lbs.
For use off a power circuit.

List No. 39.
Price 35/-
(Spare Elements 3/6 each)

As above, but with a loading of only 600 watts so that it can be used off an ordinary lamp socket.
Complete with connectors, 2 yards flex, and lamp holder adaptor.

List No. 40.
Price 47/6
(Spare Elements 3/6 each)

Similar to List No. 38, but fitted with a 3 heat switch on a separate panel, which is connected to the Glue Pot by 4 feet of metallic flexible tubing.
For use off a power circuit and recommended for Factory work.



All prices are subject to 25% advance.
Carriage extra on orders under £3 net value.

Honours and Industry.

A GREAT CHANCE OF IMPROVING A BAD RECORD.

We English have three super-jokes which stand out above all others by reason of their evident excellence—they are, in reverse order of merit, mothers-in-law, triplets, and the honours list. And the funniest thing about all three is that the man most deeply concerned, the recipient, as the case may be, of the honour, the litter, or the conjugal relative, almost invariably fails to see the real humour of the situation.

It is certainly a pity that the title or order, which should be a symbol of "something accomplished, something done" to the good of the British Empire, should lend itself to such ribaldry. But so it is. "The old order changeth, yielding place to new," and each new order seems to give a new opportunity to those set in authority over us to make fools of themselves in new ways.

Only a few years ago, as it seems, the Victorian Order was invented. Because it was new, it seemed scarcely worth having. Now, it has acquired an odour of sanctity, or of comparative antiquity, because of the invention of other orders still newer, and—euphemistically speaking—less expensive. I trust that none of my readers will, by reason of this expression, imagine for a moment that I think honours can be bought. I do not THINK anything of the kind. I know—what I know.

Let us, however, get down to the bone, where the meat is sweetest. What about this new order of the British Empire? A great card if it could have been played decently and in order. As things are, it has been used as a sop and as an ink-eraser to reduce to nothingness such blots as still remained obvious after the most copious whitewashing.

It has been showered upon parasites, it has rained upon nonentities, and it has positively descended in torrents upon the devoted (or otherwise) heads of Civil Servants. Now in what way does the Civil Servant who has done his duty during the war differ from the civilian who has done the same?

Mayhap in the degree of his civility, but if also in the degree of his positive utility, I should have no hesitation in saying upon which side the advantage lies.

If the Secretary of the Assistant Secretary of the Deputy Assistant Director of the Corkscrew Department of the Ministry of Temperance is worthy to become an M.B.E., while the Assistant Secretary achieves the distinction of an O.B.E., and the Deputy Assistant Director himself aspires to a C.B.E. or even a K.B.E., what about the man who makes the corkscrew which provides all these people with their jobs?

Is it expected that, being a manufacturer, he is necessarily coining money fast, and will, in his own good time, purchase a title of pre-war model, to the great benefit of the funds of some political party?

Is it presumed that, because he is a maker and not a mere distributor, he is actuated by no patriotic motives, and is therefore unworthy of recognition?

There may be cases to which each of these suppositions applies, but it is not fair to generalise upon the strength of them.

It is also a mistake to imagine that all the work of real national importance is done in Government offices.

I quite realise that I may be accused of beating the air, and told that many honours of B.E. type have gone to the head-lights, side-lights, and even the tail-lights of industry.

There are a certain number of people connected with the Aircraft Industry who have been treated as almost, if not quite, the equals in sterling merit of the Controller of Bootlaces and Waistcoat Buttons.

Agreed; but the thing has been done in a slip-shod sort of way. If we wanted to form a Committee of Aircraft Manufacturers, how ought it to be done? I don't say "How is it done," but "how ought it to be."

The only right and proper way would be to call the Industry together, explain what the proposed committee is for, and then leave the people who know to elect the best men for the job.

Now what is the matter with the same process as applied to honours? At present the Government rations them according to its lights, and possibly without complete disregard for its pocket.

But this same Government tells us that it hates rationing, that it is a thankless and unpleasant job, and that it will leave the industries to do their own rationing at the earliest possible moment. Here is our precedent: why not apply it?

Let the Government do what rationing it must. Let it say, "We cannot create more than 200 knights of the British Empire in one day. We will give the C.B.E. to 500, the O.B.E. to 1,000, and the M.B.E. to another 1,000. Half of all these people shall be chosen from Government Services; the other half from among civilians who have done good Imperial work from among those who have led and fought in the war of material. Now what are the industries to which the Empire is chiefly indebted? They are this, that, and the other. To this—perchance the Aircraft Industry—we will give three K.B.Es, six C.B.Es, and a dozen each of O.B.Es. and M.B.Es."

Now this is the point at which the Government should cease to interfere, merely communicating its decision to the Industry and awaiting results.

The Industry—in our case the Society of British Aircraft Constructors, as the representative body—would call a general meeting.

A satisfactory method of election would be devised, voting papers would be posted or passed round, and the men selected would be the real leaders and lights of the industry, those recognised and respected by the men who know most about their standing, their methods, and their real utility.

To these the honours would be offered, and I think that a refusal would be very rare.

At the present moment there are plenty of plain misters who could have been possessed of handles had they so desired.

Some have refused because of the humiliating conditions attached to the offer; others because they have felt themselves unworthy; others again for other causes. But a man could hardly refuse to accept the verdict of his own co-workers, or the honour which he would hold, so to speak, in trust for his industry.

However great his own modesty or his dislike for personal publicity, he would hardly fail to appreciate an honour coming to him in this way—one with regard to which no one could conceivably hint at bribes or purchase, or hidden influence.

What a chance, too, for the Government to prove, beyond possibility of dispute, that some at least of these honours—which ought to be highly prized as indicating exceptional service during the greatest war of history—are totally disconnected from political consideration, and the jugglery upon which the Party System is still dependent for the maintenance of its precarious balance.

MEDWAY.

EQUILIBRIUM INDICATORS.

From time to time reference has been made in The Aeroplane for the need of an instrument which will indicate to the pilot of an aeroplane when in the dark, or in the middle of a cloud, the true horizon and the relative position of his machine thereto. It is well known that even very experienced pilots are often unable to determine whether their aeroplanes are diving vertically, or spinning round on quaint curves, unless it is possible to see the ground.

The result of the remarks to this effect has been to cause various people with latent talent for invention seriously to set to work to find a solution to the problem. Aircraft engineers, knowing the difficulties, have practically shelved investigation in favour of more hopeful researches, but other people who are ignorant of the mechanical forces which operate in and around the flight of an aeroplane have solved the difficulty—to their own satisfaction—in about five minutes.

In almost every case a little gadget has been produced which depends upon the force of gravity to cause it to function, and usually a pendulum or a spirit level figures in the mechanism.

It should be pointed out, once and for all, that any indicating device which relies for its operation upon gravity is quite useless, because almost every deviation which an aeroplane can make from a straight line is accomplished by a movement through a curved path, with a consequent manifestation of centrifugal force, which operates on the spirit level or the pendulum just as it does on the aeroplane.

That is to say, if an aeroplane does a correctly banked turn the plumb-bob remains central, but if it chooses to perform a spin the machine takes up a bank inappropriate to the curve through which it is travelling, and the pendulum or the plumb-bob swings out to a position which tells one nothing.

If the machine loops the loop correctly, the plumb-bob remains central, but if it performs a side-slip without turning, the plumb-bob swings aimlessly.

If, as usually happens, an aeroplane starts flying on its own account, owing to the pilot having lost his orientation, the antics which it performs combine looping the loop, spinning, side-slipping and wobbling generally, so that the pendulum or the spirit level will wobble about just wherever they please and thereby indicate nothing. As one pilot put it, the bubble in the spirit-level turns into soda-water.

The need for an instrument to indicate equilibrium still remains as great as ever, but its mode of operation must be such that neither gravity nor centrifugal force affect it in any way, and a new line of research is therefore essential.

The gyroscope is the obvious way out, but it is too heavy to pay for its carriage merely as an indicator. The simplest thing to do is to make a machine inherently stable, by pure aerodynamic design and then leave it alone.

PATENTS INDEX.

The subjoined list of recent inventions has been specially compiled by The Aeroplane from the current Official Patents Records :—

Patent Applications.

Davies, A. H. Bombs and bomb-release mechanism for use in aircraft. No. 6106. April 10th.

Davies, R. L. Bomb-dropping sighting-apparatus for aircraft, adapted for automatically and synchronously training a gun on the object sighted. No. 6177. April 11th.

Davies, R. L. Clinometer for aircraft. No. 6176. April 11th.

Doran, W. T. St. Vincent. Clinometer for use on aircraft. No. 6234. April 12th.

Ferrier, A. Bombs for use on aircraft. No. 6096. April 10th.

Holden, H. Shaping-machines for aeroplane propeller blades. No. 5945. April 8th.

Mooney, D. J. Spars, etc., for aircraft. No. 6206. April 11th.

Munford, T. A. S. Sight for machine-guns, etc., for anti-aircraft work. No. 6314. April 13th.

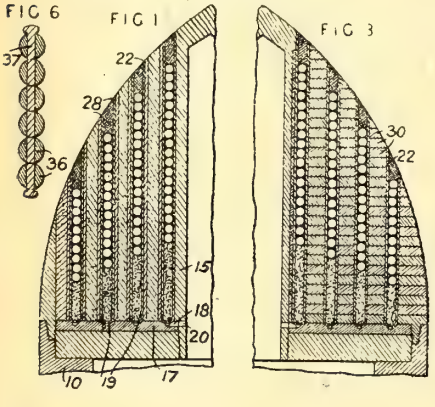
Orling, A. Photo-electric aircraft revealer. No. 6255. April 12th.

Shakespeare, G. A. Fabrics for balloons, etc. No. 6047. April 9th.

Smith, R. A. Means for stabilising balloons when towed by vessels at sea. No. 6276. April 13th.

Sopwith Aviation Co. Clip, etc., for wires of aeroplanes, etc. No. 6308. April 13th.

Taylor, G. P. Propellers of flying-machines. No. 6081. April 10th.

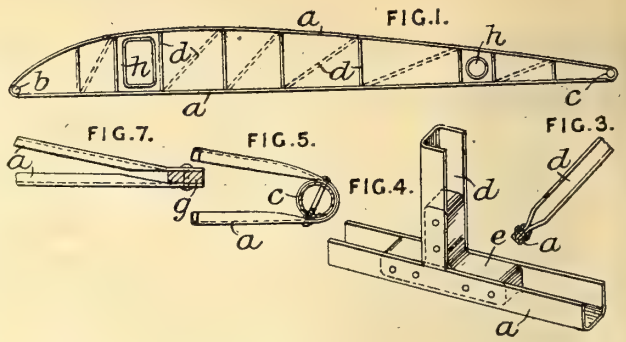


Complete Specifications Accepted, prints of which can be obtained on and after May 2nd, 1918.

114,498. April 19th, 1917. Bruce, R. A. Seat fittings for the cars of aircraft.

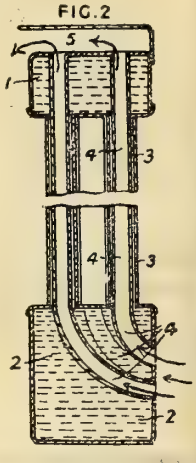
106,818. May 1st, 1916. Levy, L. G. Aeroplanes and hydro-aeroplanes.

Abridgments of recently published Specifications.



113,226. Ammunition. Graham, A. W., 184, Northland Avenue, Buffalo, New York, U.S.A.

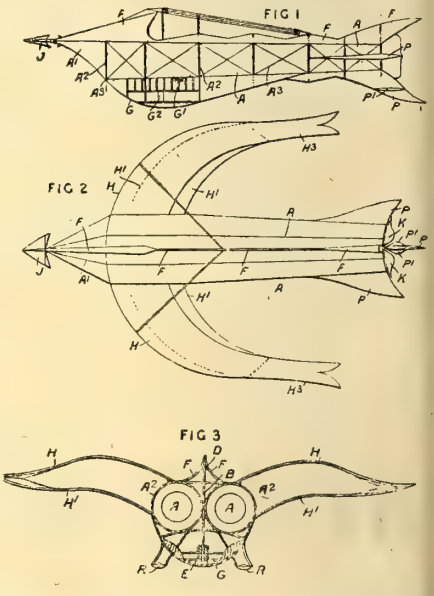
Projectiles.—Relates to projectiles of the kind in which the nose is provided with concentric rows of barrels 28, Fig. 1, containing bullets adapted to be discharged forwards in succession during flight. According to the invention, these rows of barrels are connected by fuse channels, which ignite the propellant charges in the barrels in regular sequence. These channels are arranged radically and circularly at 18 and 19 respectively in a disc 17, and ignition is communicated thereto by a time fuse through powder in a port 20 and a central tube 15. The barrels may be formed by drilling through a solid nose, or may be constituted by tubes embedded in cementing material between concentric cylinders 22, or in holes in a series of discs 30, Fig 3. For use against wires and aircraft, the bullets may be made of several balls 36, Fig. 6, strung on a headed wire or pin 37. The body 10 of the projectile contains an ordinary bursting charge.



113,295. Aeronautics. Saunders, Ltd., S. E. and Thomas, H. H., Columbine Works, Medina Road, East Cowes, Isle of Wight.

Framework; Planes, Construction of.—The fuselages, plane ribs, and other parts of aircraft are constructed of metal of U or channel section, bent to form an outer frame which is then braced by bars of similar section secured by riveting, soldering, welding, etc. Fig. 1 shows the rib of a plane formed of an outer channel *a* bent over front and rear bars *b*, *c* and fitted with channel braces *d* and with metal stampings *h* to receive the spars. Fig. 3 shows one method of jointing the braces *d* within the channel *a* by riveting, and Fig. 4 shows another method

employing a solid connector *e*. Fig. 5 shows the channel *a* flattened out for connection to a tubular end member *e*, and in Fig. 7 is shown a similar connection where the end member consists of a flat rod *g*.



113,238. Radiators for Internal Combustion Engines. Bell, F. J. (trading as Bell Brothers), 136, Highgate Street, Birmingham.

A radiator for use in connection with internal-combustion engines of motor road vehicles, aircraft, etc., comprises upper and lower tanks 1, 2 connected by water-tubes 3 enclosing centrally arranged air-tubes 4, which pass right across the tanks 1, 2 and have their lower ends forwardly bent to facilitate the entry of air. A protecting shield 5 is arranged over the upper ends of the tubes 4. A fan, pump, etc., may be arranged to increase the flow of air through the radiator.

113,286. Aeronautics. Revenall, B. P., Ingham, Queensland, Australia.

Aerial Machines without Aerostats; Framework; Planes, Arrangement of.—An aeroplane or hydro-aeroplane comprises a fuselage consisting of one or two open-ended tubes. A fitted with upper and lower wings H, H^1, a car G, and fins F, P. The tubes may be made of thin steel or aluminium, or may comprise wooden or metal hoops A^2 connected by longitudinals and bracing A^3 and covered with aeroplane fabric. The hoops are connected to vertical struts B which are secured to upper and lower longitudinals D, E.

Cars and Cabins; Aerial Warfare.—The car G is formed under the tubes A and is provided with windows or gun ports G^1 and doors G^2. The lower part or the whole may be armour-plated.

Planes, Construction of.—The upper parts of the tubes A are extended forwards to a point as shown at A^1. The wings H, H^1 are curved rearwardly in plan and formed with flexible forked extremities H^3. They are curved in section as shown in Fig. 3 and united at their extremities, and are made detachable. The longitudinal fin F comprises two concave portions extending up from the tubes A as shown in Fig. 3, and is undulated as shown in Fig. 2, the highest point being above the centre of gravity of the machine. The underneath fins P have lateral extensions P^1.

Propelling.—Propellers may be arranged at the front of the tubes A.

Steering.—The machine is fitted with front and rear elevators J, K, and the flexible forked extremities H^3 of the wings may be adjustable.

Floats, Arrangement of.—In the case of hydro-aeroplanes, floats R are provided at the forward part, and another float may be located at the rear.

113,359. Screw and like Propellers. Staunton, P. M., Aram Lodge, Castlerea, County Roscommon.

The forward surface or back of a blade is bent or curved back at its leading edge so as to develop more fully the formation of water cavities and thus increase the "negative pressure" on the blade. The driving surface A B C of a blade is plane from A to B and curved from B to C, the curved part extending from the boss outwards. Blades for aeroplane propellers are made relatively longer and narrower than the blades shown. Specifications 27662/08, 28995/09, and 27763/13 are referred to.

THE ITALIAN AIRCRAFT INDUSTRY.

Nearly a dozen new companies dealing with Aviation have been registered recently, many of which in the Southern Provinces.

The Società Marittima Italiana of Naples, which is an insurance firm going in for aero-transport risks policies, has become a "Società Anonima."

The firm of "Ing. Nicolà Romeo & Co.," of Milan, has raised its capital from 10 millions to 30 millions of lire, and has become the "Società Anonima Italiana" of that name.

Ing. O. Pomilio & Co. are transferring the official headquarters of the business to the capital.

Judging by the budding of business concerns this spring much fruit should be forthcoming by the summer.

Another of the numerous accessories now in use, and which these notes could not even in peace time adequately deal with, is the Gabbioneta four-bladed petrol pump fitted to the Caproni machines among others. The fitment has gained its place there, and so here, on its merits.

At a ceremony in memory of the heroic Capuan Captain Oreste Salamone at that place the High Commissary for Aviation said in his speech: "We must prefer the offensive to the defensive. Italy must be one big trench in the face of the enemy. We have to avenge Salamone and our other martyrs by silent work in preparing more arms, more aeroplanes, more men. . . . . Southern energy and brains must be made available."

By connecting up with a tube two rectangular receptacles set at right angles to each other, and partially filled with a suitable liquid, Engineer Corrado D'Ascanio has evolved a simple fool-proof lateral and longitudinal inclinometer. The receptacles are deep, long and narrow, of glass—triplex?—and lie the one transversely to the path of travel, the other parallel to it. Their sides are ruled to show deviation from the horizontal of the lateral or longitudinal axes of the machine.

The "Officine Ferroviarie Meridionali," a big company for railway material at Naples, has started an aviation department for building and repairing aeroplanes, and making spare parts for them either in wood or metal. The company's nominal capital is 4,000,000 lire.

Another new company of some special importance in view of the development of the South is the "Aeromarittima Italiana" of Naples. Its paid-up capital is 1,500,000 lire.

The Frèjus-Diatto motor firm at Turin has been taken over by the people who have so successfully launched the Pomilio concern of that city.

One notes the huge sum invested in the new War Loan by the "Savoia" firms and their hands. 1,200,000 lire is the great figure. A lot even in these days of excess profits.

Of the many U.S. fliers of whom one hears here nowadays, the Captain La Guardia, an American citizen of Italian origin, who is instructing near Rome, appears on account of his oratory in both tongues to be a golden find on the part of the "*Propaganda Fide*," as the church folk call the society which acts in this sense for the Holy Mother.

Major Ryan and Captain Frost are other names to bear in mind.

Is Gabriele D'Annunzio going to enthuse the Argentines too? Who forbids the Muse?—T. S. Harvey.

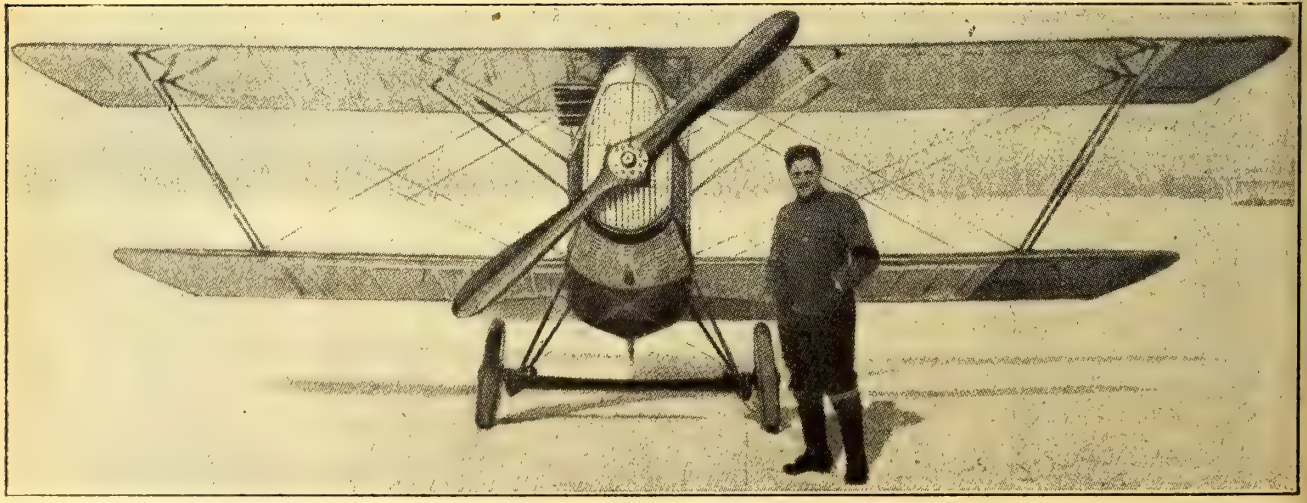
"THE JACKDAW."

Quite a number of reviews of works magazines have appeared from time to time in The Aeroplane, and while their arrival has been welcomed as an indication of enthusiasm of those concerned with their production, in many cases interest has been destroyed by the uniform nature of the lines on which they have been produced.

The latest arrival, "The Jackdaw," has much of the original to recommend it for attention. This is hardly surprising when one learns that the originator is Mr. G. Humphrey, the Managing Director of the John Dawson Co., Ltd., of Newcastle-on-Tyne, who ever since he became known to the aircraft world has been noted for his originality, particularly as concerned with advertisements.

The editorial on the subject of "Firsts" is an extremely clever conception, in which he points out how interesting the first of anything is, although on its arrival one seldom remembers that it is important merely as the promise of what is to come. Take the first aeroplane as a case in point.

A section entitled "The Labour Column" is published to provoke discussion among the readers of "The Jackdaw" and to stimulate ideas to form the subject-matter for dinner-hour debates, a distinctly useful innovation which should leave no excuse for the objectional hobby of grousing purely as a means of killing time.



In the opinion of the editor of "The Jackdaw," employers and workers should join hands on the very sound basis that the highest possible wages in return for the greatest possible output is the way to industrial peace and national prosperity.

MAN-POWER AND THE WAR.

The following resolution has been passed by the Metal Merchants Section of the London Chamber of Commerce: "That this meeting approves the appointment of a Committee to confer with members of Parliament with a view to constantly raising questions of interest to the trades concerned in the House of Commons."

For months the Chamber has been pressing the Government as to the serious effect Government trading has on the nation and the effective conduct of the war, and the resolution is a result of that view.

A Watch Committee to investigate cases was elected, and Mr. P. C. Donald, 25, Upper Thames Street, E.C., is willing to receive information respecting (1) flagrant cases of unavoidable delay, (2) inefficient methods, (3) unnecessary red tape, (4) wasted man-power efforts in Government Departments, (5) departmental inexperience, and other abuses tending to delay the delivery of war material or seriously affecting after-war conditions. The purpose is to have them brought up in the House of Commons.

"Everything from a split pin to a complete unit"

What d'ye lack?

WE bend the old-world call to modern needs: "What do you lack in aircraft parts?"

Visit our Showrooms at Ascol House, Long Acre, and there you will see displayed in orderly sequence all the requisite parts and equipment for Aircraft Construction, covering most items from a split pin to a complete unit.

We offer a complete and comprehensive service for Aircraft Manufacturers. Our aim is to give you all the help we can in the great national "speed up" of aircraft construction. Let us give you the benefit of our organisation and stocks.

THE AIRCRAFT TRADER

MARKET TOPICS.

(Prices are for quantities on usual terms.)

April 18th, 1918.

COPPER.—There has been very little alteration in the general position of this market. The output of Copper is very satisfactory, and the total figures for 1918 are likely to show a considerable improvement on 1917.

The question of price is still influencing sellers in U.S.A. Although inquiries are being received for forward delivery, there does not appear to be much inclination to take orders, the general feeling being that the Government must sanction an advance in price.

Prices.

Standard Copper	£110 0 0
B.S. English	£123 to £119
Electrolytic	£125 to £121

TIN.—This market is in a very uncertain condition. Prices have recently advanced, due, apparently, to the prices in the East having been forced up, and although there are plenty of buyers waiting to place orders, sellers are very backward.

There is still a big difference between the London price and the price in the East. This probably accounts for the lack of offers, and is furthermore responsible for the general feeling that the tendency of the market is upward.

The position in U.S.A. is still very serious and buyers are keenly snapping up every pound of available Tin.

Comparative Prices.

To-day, 18th	£322 0 0
April, 12th	£322 0 0
April 6th	£316 0 0
Last month	£320 0 0
Highest price, 1917	£309 0 0

LEAD.—There appears to be ample supplies of Lead now available for war purposes, and the position generally has improved. Prices remain unchanged.

STEEL.—This market is in a very satisfactory condition. Ample supplies of steel are available. In fact, one occasionally hears of firms looking round for orders. The mills have certainly done remarkably well during the past 12 months.

Seeing that there is an indication that the output of certain steels is now greater than the demand, it is quite probable that the Ministry of Munitions will relax some of the export restrictions. As stated previously the stoppage of Russian orders has relieved the Tool Steel position.

Prices still continue unchanged.

TIMBER.—The shortage of Timber supplies, particularly Silver Spruce and suitable substitutes, is causing very grave anxiety amongst Aircraft constructors.

It is reported, on very reliable authority, that several firms engaged on aircraft work have practically no suitable timber in stock. One factory, at least, is unable to make headway owing to scarcity of timber. It is certainly time that the responsibility for this serious state of affairs was fixed and the culprit or culprits brought to "boot."

The present famine was foreseen months ago, and on many occasions this paper has uttered grave warnings.

Even as far back as June last attention was called to the prevailing shortage, and again in November the problem was dealt with.

It will do no harm to reiterate the probable causes for what was then a "Timber crisis." See issues December 5th and 12th, 1917.

The present crisis can only be attributed to one or more of the following causes :—

(1) Failure to grasp the future (now present) requirements of the Aircraft Industry.

(2) Failure to allow for unforeseen contingencies, i.e., submarines, strikes, rejects.

(3) Delay in authorising and securing more than ample supplies of Silver Spruce substitutes when the shortage was beginning to show itself.

(4) Failure in ensuring that the Silver Spruce was perfectly suitable for aircraft work before being shipped.

(5) Failure in providing shipping for merchants who could get the wood.

(6) Failure in giving permission for a substitute to be used on school machines.

(7) Failure in carrying out a drastic reformation of A.I.D. inspection of wood parts and units.

If the substitute timber which was imported by the Government had turned out satisfactory for general aeroplane work, i.e., struts, spars, longerons etc., etc., the present serious condition of affairs would have been averted and it would be interesting to have answers to the following questions :—

(1) Why did the Air Board put all its eggs in one basket and purchase one substitute only (rumour says several thousand standards) when there were other suitable woods available?

(2) Did it make quite sure that the parcels were suitable for aeroplane work before they were shipped?

(3) What will be done with this huge quantity if it fails to pass Specification VI.?

Prices remain unaltered.

FABRIC.—Supplies are fairly well maintained, and energetic measures are being made to avert a serious shortage during the next few months. It appears to be a "touch and go" state of affairs.

MICA.

The Minister of Munitions, in exercise of the powers conferred upon him by the Defence of the Realm Regulations and all other powers thereunto enabling him, hereby orders as follows :—

1. No person shall as from the date hereof until further notice purchase or take delivery of any Mica as hereinafter defined situated in the United Kingdom except under and in accordance with the terms of a licence issued under the authority of the Minister of Munitions, or sell or deliver any such Mica to any person other than the holder of such a licence and in accordance with the terms thereof.

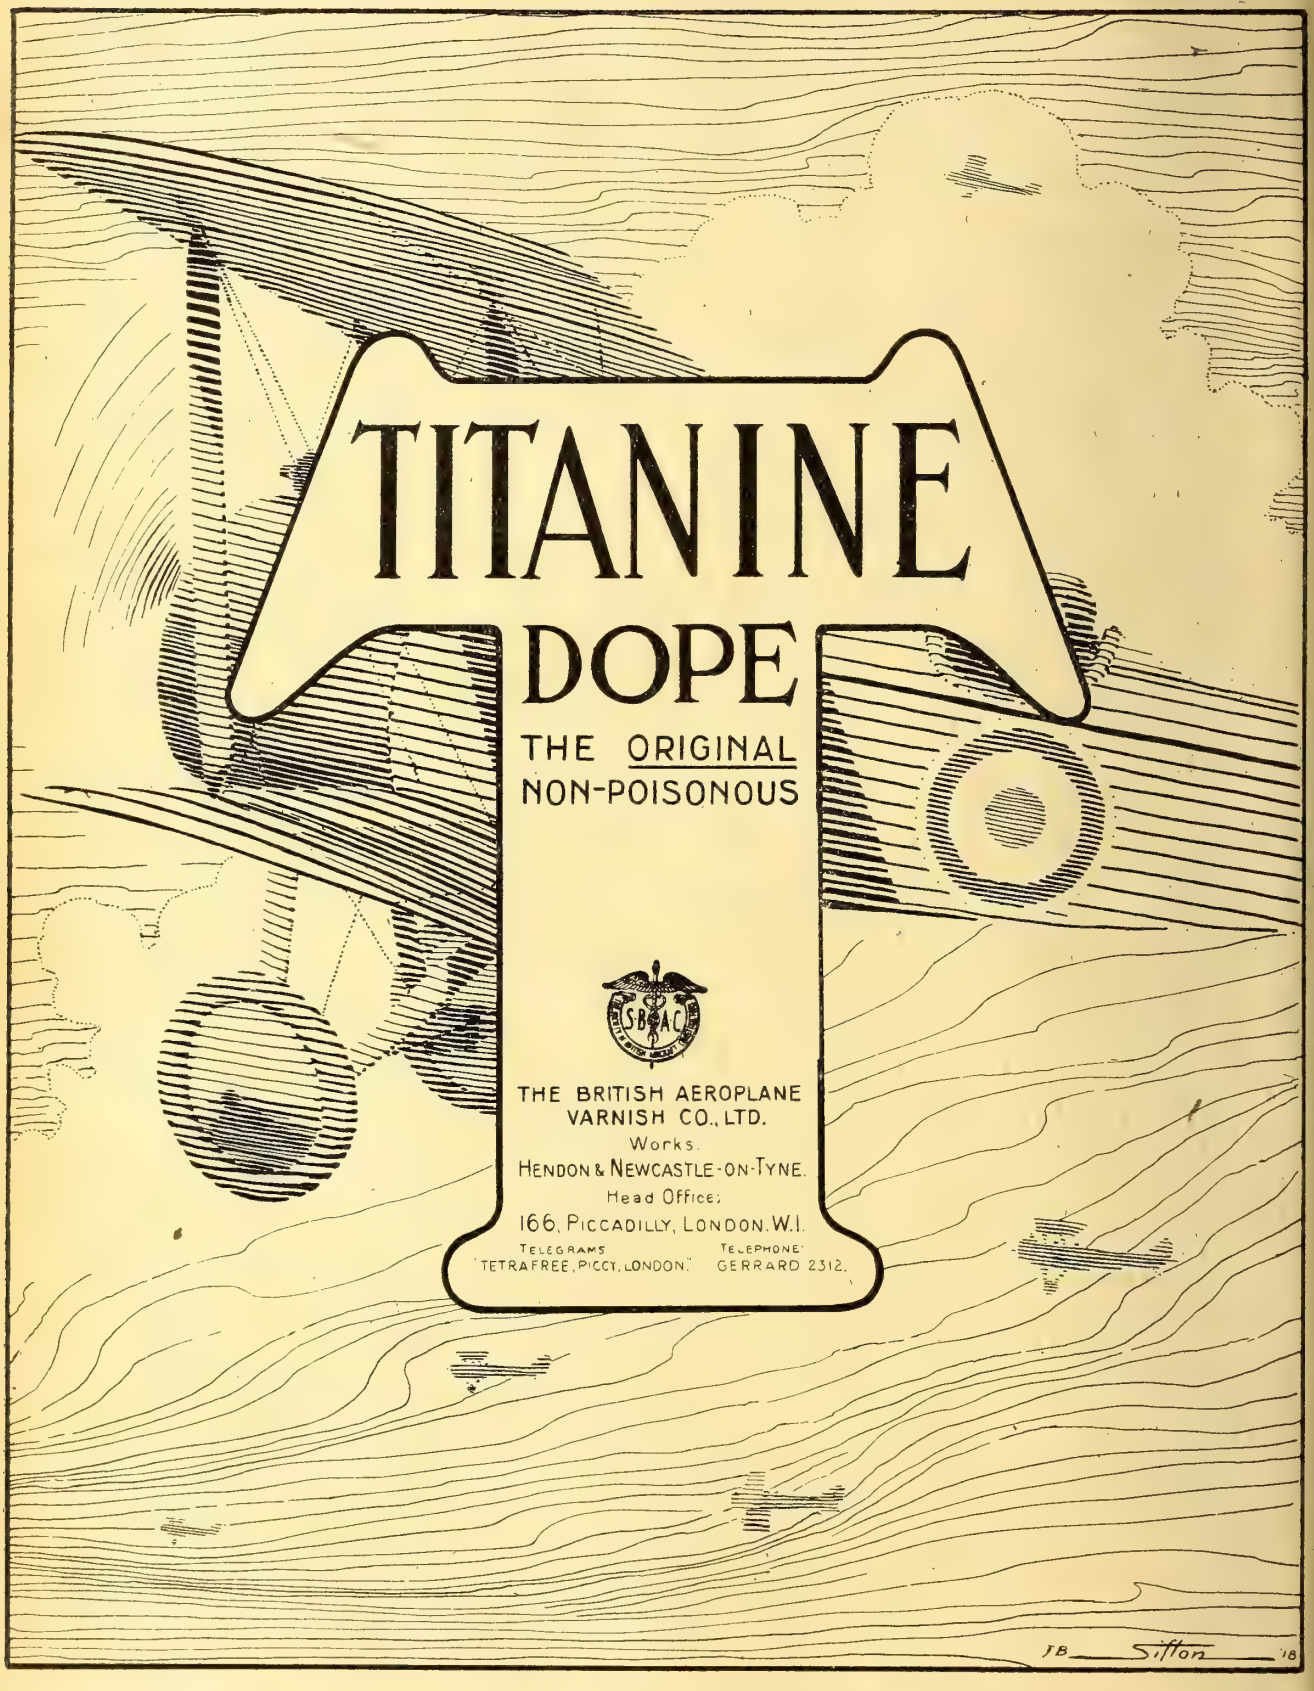
2. No person shall as from the date hereof until further notice use any Mica for the purpose of any manufacture or work except under and in accordance with the terms of a licence issued under the authority of the Minister of Munitions.

3. All persons shall send to the Controller of Non-Ferrous Materials (MS/R), Ministry of Munitions, 8, Northumberland Avenue, W.C.2, such returns with regard to their stocks, purchases, sales and deliveries of Mica and any contracts or orders made or given to or by them requiring for their execution the use of Mica as shall from time to time be required by the said Controller of Non-Ferrous Materials.

4. All applications for licences under this Order shall be made to the said Controller of Non-Ferrous Materials and marked "Mica Licence."

5. For the purposes of this Order the expression "Mica" shall mean block Mica of the following quality and size grades :—

Clear and partly stained "Ruby" of "best" or "Government standard" quality, or suitable for use in the manufacture of magneto condenser plates, in size grades No. 3 to No. 6, inclusive, or their equivalent in rectangular or other trimming, and shall include Mica coming within the above definition when split from block of any quality.



6. This Order may be cited as the Mica Control Order, 1918.

Note.—Any person acting in contravention of or failing to comply with the above Order or making a false return will be guilty of an offence under the Defence of the Realm Regulations, and be liable to penalties of fine and imprisonment.

FLAX AND HEMP.

The Flax Control Board announces that an Order has been made by the Army Council amending the Hemp (Restriction of Consumption) Order, 1918, by extending the restrictions imposed by that Order to hackled tow produced in the United Kingdom from hemp of the specified descriptions. A further Order provides that dealings in hackled tows produced from any flax or from hemp of the specified descriptions require the licence of the Scottish and Irish Sub-Committees of the Flax Control Board respectively.

Tow licences issued under the Order of March 21st, 1916, are withdrawn, and applications should be made, in the case of dealings in tow of these classes, to the Irish Sub-Committee, 31, Wellington Place, Belfast, or to the Scottish Sub-Committee, 10, Victoria Chambers, Dundee.

AIRCRAFT FINANCE

CURRENT TOPICS.

MUNITION CONTRACTS.

A point of more than general interest was voiced at the shareholders meeting of Mappin & Webb, Ltd., last week by the Chairman of the company in reference to the record sales of the past year. In the course of a lengthy speech, he said:—

"Very considerable munition contracts have been entered into during the year. You might expect to be told that these had materially helped our profits. As a matter of fact, they did not. We made little or no profit on this branch of our business. You have, however, the satisfaction of feeling that our company has helped in munitions, so much needed by your country."

Coming as this does concurrently with the disclosure of the Finance scandals connected with the accounts of the Ministry of Munitions and the Auditor-General's scathing comments, it prompts one to ask what is going to be done about it, when some firms can make no profit although money is being wasted elsewhere.

It cannot be assumed that although there is no word of dismissal of the responsible officials that the authorities view the facts with unconcern. Surely if ever there was a case in which names should be disclosed this is one. Otherwise every firm and company carrying out war contracts is under suspicion, and the matter is much too important to be shelved in this neglible manner.

BRENTFORD AIRCRAFT, LTD.

A prospectus marked "Private information for Directors and Members" is in course of being circulated with the obvious intention of securing capital from the public.

The company is of quite recent registration. The printed particulars refer to a "Private issue of 5,000 shares," and it is necessary to warn the promoters and directors that this method of procedure is in direct contravention (1) of the Companies Acts, and (2) of the Treasury Regulations both of which were framed to prevent just this very identical form of company promotion.

It is apparent from the printed particulars furnished that the company has nothing to sell, but the manner in which the printed information is set out might well lead an unsuspecting investor to imagine that the company own freehold property, whereas a careful perusal of the document shows that someone is to receive £400 for the benefit of the negotiations respecting the purchase of the property.

It is astonishing to find in the circumstances that the printed particulars bear the names of a worthy Lieut.-Col. (no doubt a better soldier than a company promoter) and the name of a firm of solicitors, but what is still more astounding is that the London County and Westminster Bank, Limited, should have permitted their bank to appear on the front page. It would not be a matter of much surprise to learn that they are not cognisant of the fact.—G. A.

COMPANIES ANNOUNCEMENTS.

NEW COMPANY REGISTERED

The file of the following new company is available for inspection at Somerset House.

Flightcraft, Ltd.—Private company. Registered April 3rd. Capital, £5,000 in £1 shares. Engineers, founders, smiths, machinists, manufacturers of and dealers in aeroplanes, airships and balloons, etc. Agreement with F. A. Coulson. The subscribers (each with one share) are:— F. A. Coulson, 199, Piccadilly, W.1, aeronautical engineer; J. A. Lockwood, 4, New River Crescent, Palmer's Green, N.13, company secretary. The first directors are:—F. A. Coulson, C. J. Axten, W. G. Fearn, and J. S. Lockwood. F. A. Coulson, C. J. Axten, and W. G. Fearn are permanent. Solicitors: Timbrell and Deighton, 90, Cannon Street, E.C.

DIVIDEND DECLARATIONS.

Vickers, Ltd.—The directors have decided to recommend a final dividend for the year 1917 of 1s. 6d. per share (free of income-tax at 5s. in the £) on the ordinary share capital of the company, making 2s. 6d. per share, or 12½ per cent., for the year, free of income-tax at 5s. in the £. The dividend will be payable on May 10th, 1918. The transfer books of the ordinary shares of the company will, in accordance with the company's articles of association, be closed from Monday, April 29th to May 10th, inclusive. The directors further state that they hope that the accounts for 1915 will soon be completed, but the completion of the accounts for 1916 and 1917 must still be delayed for a considerable time. An extraordinary meeting will be held after the general meeting on April 25th to alter the articles of association so as to give more powers to the directors. It is desired to acquire, establish, or carry on any business or industry, whether manufacturing or otherwise, which may be calculated to be profitable, and to form any company or companies for acquiring any property or rights which may seem directly or indirectly calculated to benefit the company.

MORTGAGES AND CHARGES.

Cowper-Coles Aircraft Co., Ltd.—Registered April 3rd, 1918. Debentures £10,000, secured by a general charge on the company's assets in favour of the London Provincial and South Western Bank, Ltd.

Handley Page Ltd.—Registered April 3rd, 1918. Debenture £100,000, secured by a general charge on the company's assets in favour of the London Provincial and South Western Bank, Ltd.

Norman Thompson Flight Co., Ltd.—Registered April 8th, 1918. Debenture £15,000, secured by a general charge on the company's assets.

ANSWERS TO CORRESPONDENTS.

"Air Raider."—The recent registration of the British Cellulose and Chemical Manufacturing (Patent Company), Ltd., with a capital of £3,500,000, has given rise to a mass of rather amusing guesswork with regard to its formation and composition. It is, of course, quite apparent from the composition of the Board that Vickers, the Nobel's Explosives Company, and certain important chemical concerns are interested in this important new company, but there is no foundation for the suggestion that it is the undertaking which will effect the proposed combination of the principal explosives companies. It is an entirely independent concern, though, of course, the explosive companies would naturally desire to be interested in undertakings which produce some of the materials they require for their business.

"Accounts."—Whilst without doubt there are many minor companies adopting the now fashionable camouflage of deferring the publication of accounts owing to outstanding questions connected with Excess Profits duties, etc., unquestionably there are cases where the accounts cannot be made up. Some important companies have supplied goods under contracts in which the price is not even definitely determined, consequently one must not regard every company coming under this category as open to suspicion. The method is, however, becoming too general to be healthy. G. A.

THE AEROPLANE BLUE BOOK.

This important work of reference is now on sale. It is rightly described as "A Directory of Aircraft Finance," containing as it does detailed particulars of all the important and many of lesser known companies manufacturing and connected with the Aircraft Industry.

It is published at the popular price of 1s. 6d. by The Aeroplane and General Publishing Co., Ltd., 2, Breams Buildings, Chancery Lane, and should be in the hands of every manufacturer, trader, official, and shareholder interested in the finances of the industry.

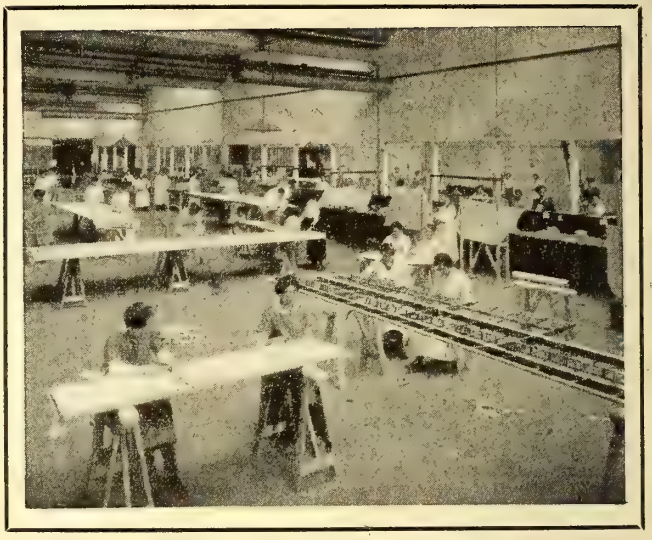
The information contained in the work comprises:—

The capital of each company, how divided, the amount subscribed, and the date of incorporation.

The names of directors, officials, and the registered address of the company.

Particulars of mortgages and charges.

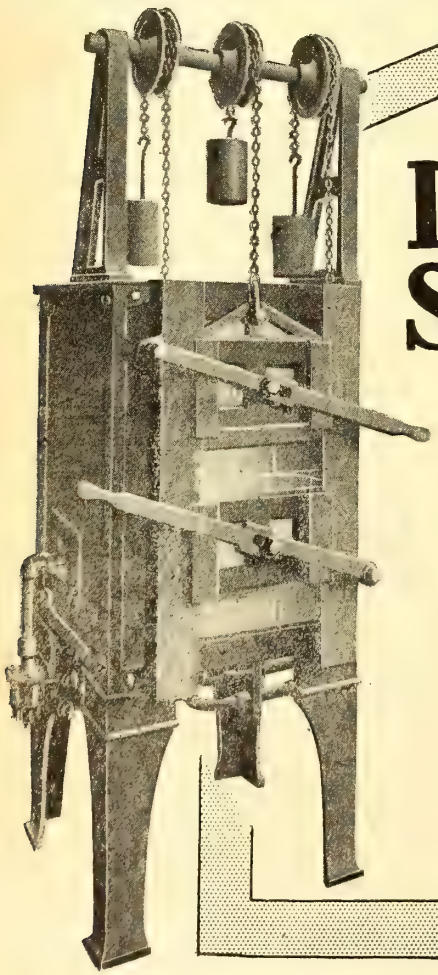
Profits and dividends declared.



Date of making up annual accounts with extracts from last published balance sheet and directors' reports.

Every effort has been made to render the most complete information and the particulars wherever possible have been officially revised.

In consequence of the paper supply restrictions this issue has been necessarily limited. Immediate application for copies is therefore advised to avoid disappointment.



Humber

PREFERENCE for the Humber Car is proof of good judgment. Willingness to wait for one is evidence of sound patriotism. The necessity for this exercise of patience is to be found in the accompanying picture.

Part of Plane Construction Shop.

HUMBER LIMITED.

Davis High-Speed Steel Furnaces

The Davis "D.H.S.T." series of Gas-Fired Furnaces have been specially designed for the hardening of modern High Speed Steel Tools, and to provide the maximum of convenience and efficiency at the least practicable fuel cost.

The fixing element consists of Davis PATENT Air-Blast Burners, for gas at ordinary main pressure and air at 3 lbs. per square inch. Two chambers are provided, each fitted with rise-and-fall door complete with counter-balance gearing and actuating levers. A pre-heating temperature of 1000°C is attainable in the upper chamber, the lower one reaching 1500°C; whilst the flame does not impinge on the work.

Illustration shows the D.H.S.T. 200 Series (working spaces from 11 ins. × 9 ins. × 4½ ins. to 21 ins. × 18 ins. × 9 ins. Prices from **£39** complete. Write for lists F18 A. B. & C. (gratis)

Also Oven Furnaces, Muffles, Lead Melters, Crucibles, etc.

Lt. C. H. Holcroft, R. War. R., T.F.; Temp. Lt. W. Douglas, Gen. List, March 1st. Sec. Lt. (temp. Lt.) V. V. Cadman, Middx. R., T.F., an Asst. Instr. in Gunnery (graded as an Equipt. Officer, 3rd Cl.), Schools of Aerial Gunnery, March 3rd.

Adjt.—Temp. Lt. F. J. Wood, attd. Suff. R., to be transfd. to R.F.C., Gen. List, and to be temp. Capt. (with pay and allowances as Lt.) while so empld., March 1st.

Park Comdr.—Capt. (temp. Lt.-Col.) W. E. G. Ord-Statter, R. Lanc. R., from a Spec. Appt. (graded as a Depot Comdr.), to relinquish his temp. rank, and to be temp. Maj. while so empld., Jan. 17th, seny. April 19th, 1917.

Schools of Instrn.—School of Technical Training.—Asst. Instr.—(Graded as an Equipt. Officer, 2nd Cl.).—Temp. Sec. Lt. A. Colledge, Gen. List, an Equipt. Officer, 3rd Cl., and to be temp. Lt. while so empld., March 22nd.

Park Comdrs.—And to be temp. Majs. while so empld.:—Capt. (actg. Lt.-Col.) H. R. Bently, Ches. R., to relinquish his actg. rank, and to be secd., Feb. 26th; temp. Capt. G. L. Paine, Training Res., and to be transfd. to R.F.C., Gen. List, March 1st.

War Office, April 22nd.

REGULAR FORCES.—Staff.—Attached to Hdqr. Units.—Brig.-Comdr.—The rank of Bt. Major (temp. Lt.-Col.) R. R. Smith-Barry, R.F.C., Spec. Res., is as now described, and not as in "Gazette" of Feb. 8th and March 18th.

Lt.-Col. H. R. Cumming, D.S.O., Durh. L.I., and to be temp. Brig.-Gen. while so empld., vice Col. (temp. Brig.-Gen.) D. E. Cayley, C.M.G., Worc. R., March 16th.

Establishments.—R.F.C.—Mil. Wing.—Staff Officer, 3rd Cl.—(Graded as a Staff Capt.)—Lt. G. C. Bateman, E. Kent R., T.F., to be secd., and to be temp. Capt. while so empld., March 18th.

Sqdn. Comdr.—Capt. G. D. Gardner, M.C., York R., T.F., from Flt. Comdr., and to be temp. Maj. while so empld., March 13th.

Flt. Comdr.—Lt. W. J. Corbishley, York and Lanc. R., from a Flying Officer, and to be temp. Capt. while so empld., March 21st.

Spec. Appt.—(Graded as a Flt. Comdr.)—Capt. R. H. C. Usher, M.C., Wilts R., Spec. Res., from a Special Appt. (graded as an Equipt. Officer, 1st Cl.), March 18th.

Schools of Instrn.—Armament School.—Instrs. in Gunnery.—(Graded as Equipt. Officers, 1st Cl.): Capt. P. S. Jackson-Taylor, Hereford R., T.F., from an Asst. Instr. in Gunnery (graded as Equipt. Officer, 2nd Cl.); Sec. Lt (temp. Capt.) P. H. R. Whittet, M.C., Spec. Res., an Equipt. Officer, 3rd Cl., and to retain his temp. rank while so empld.; Lt. G. A. Heath, Glouc. R., Spec. Res., from an Asst. Instr. in Gunnery (graded as Equipt. Officer, 2nd Cl.), and to be temp. Capt. while so empld. (Feb. 23rd).

Asst. Instrs. in Gunnery.—(Graded as Equipt. Officers), 2nd Cl.).—From Asst. Instrs. in Gunnery (graded as Equipt. Officers, 3rd Cl.): Capt. T. N. Weguelin, Hamps. R., T.F.; Temp. Lt. G. C. C. Pentland, Gen. List; Temp. Lt. W. R. Carrick, Gen. List; Lt. C. A. Hoy, M.C., Cyclist Bn., T.F.; Lt. E. L. French, R. Ir. Rif., Spec. Res.; Lt. A. L. C. Fuller, D. Gds. (Feb. 23rd); and to be temp. Lts. while so empld.: Temp. Sec. Lt. H. W. Hire, Gen. List; Temp. Sec. Lt. T. C. Sterndale-Bennett, Gen. List; Sec. Lt. E. A. B. Carter, Middx. R., T.F.; Sec. Lt. A. G. Berry, R. Suss. R., T.F.; Temp. Sec. Lt. A. F. Hambly, Essex R., and to be transfd. to R.F.C., Gen. List (Feb. 23rd).

Gen. List.—Flt. Serjt. J. E. Howell, from R.F.C., to be temp. Sec. Lt. (Jan. 3rd); 3rd Cl. Air Mechanics, from R.F.C., to be temp. Sec. Lts.: E. Milner, S. Scott, G. W. Thorpe (Jan. 11th); H. O'Connor, D. W. Holmes, B. I. Ward, N. P. Atkinson, G. F. Spaulding (Jan. 12th); A. Pinks, J. B. C. Knight (Jan. 14th); A. H. Ashton (Jan. 15th); L. F. Mead (Jan. 16th).

Infantry.—R. Suss. R.: Capt. J. L. Head, from Lond. R., T.F., attd. R.F.C., to be Sec. Lt. (April 23rd, seny. from May 4th, 1915).

* * *

The King has been pleased to approve of the following awards to the undermentioned officers in recognition of their gallantry and devotion to duty in the Field:—

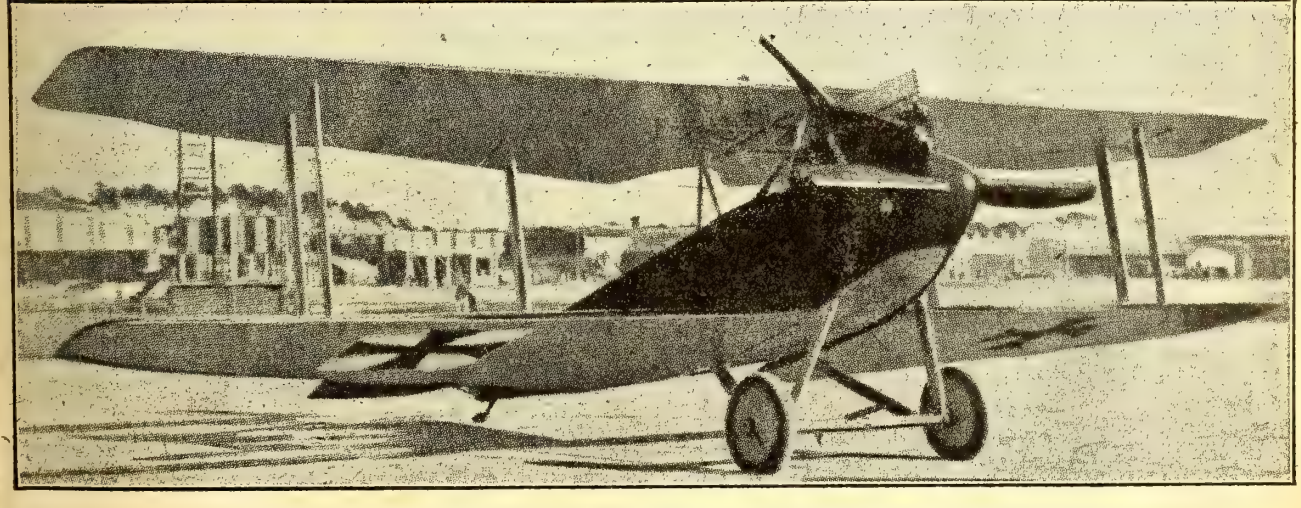
The Distinguished Service Order.

Lt. (Temp. Capt.) W. B. Farrington, Notts and Derby R., Spec. Res., and R.F.C.

On five occasions during a period of three months he has led formations on long-distance bombing raids, in which, despite bad weather conditions, he has found and bombed his objectives with the most excellent results. All the operations in which he has taken part have proved highly successful, and his capabilities have stood out most prominently. He is a keen and most efficient pilot, and by his courage and determination has set a splendid example to his squadron.

Lt. (Temp. Maj.) W. R. Snow, M.C., R.F.C., Spec. Res.

During a flight lasting three hours and 40 minutes he successfully registered two siege batteries on a hostile battery, and observed 100 and 150 rounds respectively. On one occasion he made four trips and dropped 12 112 lb. bombs on two aerodrome objectives. He has carried out a large number of successful counter battery and trench registration shoots under exceedingly unfavourable weather conditions, and has at all times carried out his duties in a thoroughly keen and able manner, displaying a magnificent spirit of dash and energy.



A Bar to the Military Cross.

Lt. (Temp. Capt.) H. H. Balfour, M.C., K.R.R.C., Spec. Res., and R.F.C.

On three occasions during one month he has destroyed one hostile machine and driven down two others completely out of control. On one occasion, flying at a very low altitude, under extremely adverse weather conditions, he carried out a reconnaissance, in which he bombed two guns and silenced them, bombed large bodies of troops in a market square, and fired into the hangars and huts in a hostile aerodrome, several casualties being observed. He has at all times shown himself to be a leader of exceptional dash and ability, and offensive patrols led by him have constantly attacked enemy formations with marked gallantry and determination. (M.C. gazetted May 26th, 1917.)

Lt. (Temp. Capt.) P. Huskinson, M.C., Notts and Derby R., and R.F.C.

During a period of six months he has destroyed two hostile machines and driven down seven others out of control. He has also, during an attack, carried out a ground patrol, flying at a very low altitude, during which he engaged a company of the enemy with machine-gun fire. On a later occasion, when firing at roads from a low altitude, he received a direct

Front View of the A G O Biplane. Note the curious tapering wings, and the single inner interplane strut to the rear spar, with two struts to the outer bay.

hit from a shell, which carried away a portion of his machine. He, however, regained control, and landing upside down in a shell-hole full of water was suspended in the water until nearly drowned. After his rescue, he remained all day working under shell fire until he had salved the engine. He has at all times proved himself to be a very gallant, keen, and able pilot. (M.C. gazetted July 27th, 1916.)

Sec. Lt. G. F. H. McElroy, M.C., R.G.A. and R.F.C.

When on an offensive patrol, observing a hostile scout diving on one of our aeroplanes, he opened fire, and sent down the enemy machine in an irregular spin out of control, when it finally crashed completely. Later in the same day he sent down another enemy machine in flames. On another occasion, when on offensive patrol, he singled one out of four enemy machines, and sent it down crashing to earth. On the same day he attacked another enemy machine, and, after firing 200 rounds, it burst into flames. On a later occasion he opened fire on an enemy scout at 400 yards range, and finally sent it down in a slow spin out of control. In addition this officer has brought down two other enemy machines completely out of control, his skill and determination being most praiseworthy. (M.C. gazetted March 26th, 1918.)

Temp. Capt. J. H. Norton, M.C., R.F.C.

While he was carrying out observation for an important artillery shoot, two hostile aeroplanes endeavoured to interfere. These he at once attacked and drove off, afterwards continuing his observation for the shoot, during which two hostile emplacements were destroyed. His dash and determination contributed greatly to the success of the operation. (M.C. gazetted May 25th, 1917.)

The Military Cross.

Sec. Lt. (temp. Capt.) J. M. Allport, R.F.C., Spec. Res.

On one occasion during night flying he made four trips during a period of four hours, dropping sixty bombs on his two objectives with excellent results. On a later occasion, whilst on photographing work, he was attacked by six enemy machines, but by skilful manœuvring he enabled his observer to shoot down in flames one enemy machine, another falling to pieces in the air. On several occasions he has carried out his tasks of photographing hostile battery positions and calibrating our long-range batteries on their targets under the most unfavourable conditions and with excellent results, showing a magnificent example to the whole squadron.

Temp. Sec. Lt. W. M. Blackie, Gen. List, and R.F.C.

When on a special reconnaissance of two small hostile works, he dived to within 300ft. of the ground, dropped his bombs near the works and then engaged with machine-gun fire a number of men who were running for cover. On a previous occasion he carried out a very successful night bombing raid under the most adverse conditions. He has always shown great determination, and has set a splendid example to his squadron.

Lt. F. E. Brown, R. Dub. Fus., Spec. Res., and R.F.C.

Whilst leading a patrol of five machines, on observing four hostile scouts diving on one of our formations, he at once engaged them, driving one of them down completely out of control, while his formation dispersed the others. Later, on sighting another hostile scout, he engaged it and forced it down spinning and out of control. While returning to his aerodrome, he observed an enemy two-seater, and, although his engine was running badly and might have failed him any moment, he attacked it and drove it down in a vertical nose dive. Previously to this he had driven down one other machine, which was seen to crash, and a third completely out of control. He is a most daring and skilful pilot.

Temp. Sec. Lt. A. K. Cowper, Gen. List and R.F.C.

Whilst leading a patrol of six machines he observed four hostile triplanes, one of which he attacked, succeeding in causing it to break up in the air. The remaining three enemy machines were destroyed by the rest of the patrol. On the return journey he encountered an enemy scout, and shepherding it by the most skilful piloting west of the lines, forced it to land undamaged on one of our aerodromes. On a later occasion, during three separate combats, he and his patrol brought down one machine completely out of control, and two others with their observers wounded, and later in the same day three other machines completely out of control. Previously to this he has assisted in destroying six other enemy scouts, displaying at all times the greatest courage and determination.

Temp. Lt. G. C. Cuthbertson, Gen. List, and R.F.C.

During a period of two months he has destroyed two enemy machines, one of which was a triplane, and sent down one other completely out of control. He has also carried out at very low altitudes several valuable reconnaissances at a long distance behind the enemy lines, and has set an example of the greatest pluck and determination to all ranks.

Sec. Lt. (Temp. Lt.) C. R. Davidson, H.L.I. and R.F.C.

He forced a hostile aeroplane to land, and, descending to a low altitude, despite heavy rifle fire, shot down one of the occupants as he was escaping from the machine. On two later occasions he forced an enemy machine to land, and drove down another, which was last seen diving into country in which it was impossible to land. Finally, though his ankle was fractured by a bullet during an air combat, he landed without injury either to his observer or his machine.

Temp. Lt. A. W. Hammond, R.E., attd. R.F.C.

When acting as observer on photographic work, though his machine was attacked by six enemy aeroplanes, he with great coolness shot down two of these. On two later occasions a large number of hostile battery positions were photographed, engaged and successfully silenced, as well as some of our long range batteries calibrated on hostile targets. The eminently satisfactory manner in which all these tasks were accomplished is due to this officer's keenness, conscientiousness, and devotion to duty.

Temp. Sec. Lt. E. W. A. Hunt, Gen. List, and R.F.C.

Whilst carrying out a bombing raid on an enemy aerodrome, on being attacked by twenty hostile machines, he engaged a hostile scout at close range and drove it down. On an earlier occasion he attacked and destroyed an enemy scout. He has carried out many most successful night bombing raids, dropping his bombs with good effect on trains and aerodromes and attacking troops and transport with machine-gun fire from low altitudes. He has shown the greatest determination and enterprise under the most difficult conditions.

Temp. Sec. Lt. D. F. Hurr, Middx. R., attd. R.F.C.

While he was on a special reconnaissance his machine was attacked when he was at a height of 5,000 feet over his objective by enemy aeroplanes, which he succeeded in driving off. Having descended to within 1,000 feet of the ground, he was heavily engaged by machine-gun fire, which wounded his observer, who collapsed. He then descended to within 400 feet of the ground and completed a comprehensive reconnaissance. He has at all times displayed the utmost disregard of danger and great devotion to duty.

Lt. (Temp. Capt.) D. G. B. Jardine, H.L.I. and R.F.C.

On two occasions when his formation was attacked by larger bodies of enemy scouts, he and his observer sent one of the enemy down in flames and two others completely out of control. During a period of three months he carried out two exceptionally long reconnaissances, during which he took a large number of photographs, containing most valuable information. His personal efforts and example are of the greatest value to the other pilots of the squadron.

Temp. Sec. Lt. C. F. King, Gen. List and R.F.C.

On five occasions during a period of three months he has sent down four enemy machines completely out of control, and has destroyed one other. Later, under very adverse weather conditions, he carried out a low reconnaissance, during which he engaged troops in a station, causing several casualties, fired into a body of the enemy entering a village from a height of 50ft., attacked four gun limbers, causing the teams to stampede, and finally dived on to a parade of troops, who scattered in all directions. He has displayed exceptional daring and skill, which, combined with a splendid dash and initiative, have set a fine example to his squadron.

Lt. (Temp. Capt.) T. J. C. Martyn, Lond. R., and R.F.C.

On numerous occasions during a period of five months he has reached his objectives and released his bombs with marked effect and with the most excellent results. His work has invariably been characterised by the greatest keenness, determination, and devotion to duty.

Sec. Lt. J. A. McCudden, Gen. List, R.F.C.

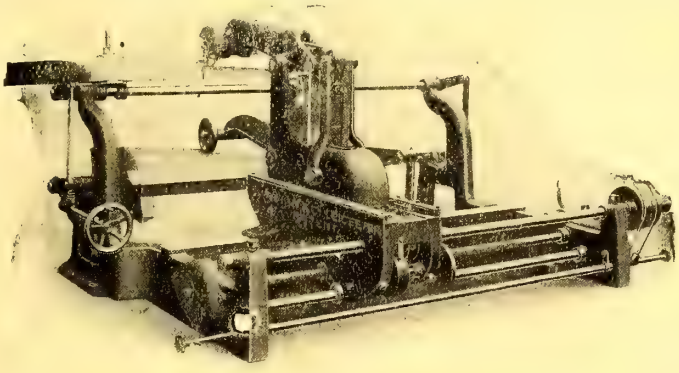
While on patrol he attacked single-handed two enemy triplanes, causing one to dive down steeply under control and the other to crash to the ground. On the day previous to this he destroyed a hostile two-seater, besides which he has driven down one other machine, which was observed to be destroyed, and four others completely out of control. He has always displayed great courage and determination.

Temp. Sec. Lt. G. McPherson, Gen. List and R.F.C.

When acting as observer on a special reconnaissance, he assisted in driving off an enemy aeroplane when his machine was at a height of 5,000 feet over his objective. Having descended to within 1,000 feet of the ground, he was wounded in the head from machine-gun fire, and collapsed. During the period when his pilot was descending still further to within 400 feet of the ground, he revived, and rendered further assistance in the reconnaissance, and on returning to his aerodrome was just able to make his report. He has at all times displayed the utmost disregard of danger and great devotion to duty.

Capt. J. A. Middleton, R.F.A. and R.F.C.

On one occasion he made two successive attacks on an enemy aerodrome, and, despite a mist and the intense activity



AUTOMATIC PROPELLER SHAPERS.

For Propellers having any number of blades.

Our latest machines have 2 speeds of traverse along the blade, viz.: 3¼in. and 5¾in. per minute.

An average size propeller can be shaped therefore in 30 mins.

Over 100 of these machines now in commission.

Made in 2 sizes to take propellers up to 12ft. and 14ft. dia.

Either machine deals with propellers 16in. wide and 9½in deep through hub.

PRICES.

12ft. type.. **£282 10s.**
14ft. ,, **£309 10s.**

An important feature is that WOODEN FORMERS ONLY are required. These can be easily made in your own shop and make the manufacture of small quantities of propellers a paying proposition on our machine.

SPECIAL ARRANGEMENTS with Sub-Contractors for HANDLEY-PAGE Type Land Machines or "AMERICA" Type Flying Boats

of hostile aircraft, dropped his bombs, obtaining two direct hits on the hangars. On a later occasion, during a gale, he made two journeys to bomb enemy rest billets, obtaining several direct hits on his objectives and attacking hostile transport on the roads with machine-gun fire. He has at all times shown great courage and skill, and has set an example which has been of great value to his squadron.

Sec. Lt. (temp. Capt.) L. Minot, R.F.C., Spec. Res.

When leading a formation of five bombing machines he attacked a hostile formation of 20 machines, and in the ensuing fight himself drove down two enemy machines completely out of control, whilst his observer destroyed another. Another four of the enemy formation were driven down completely out of control, and, as a result of his gallant leadership and determined action, his formation succeeded in getting back with the loss of but one machine. On a previous occasion he, in company with two other machines, attacked four of the enemy who were reinforced later by 13 scouts, and, after heavy fighting, drove down one enemy machine out of control, his formation returning safely.

Capt. R. N. Montagu-Stuart-Wortley, Yeo. and R.F.C.

On each of three occasions, when on offensive patrol, he has attacked and brought down in flames one enemy aeroplane, in addition to which he has sent down out of control three other hostile machines. He has displayed great courage and determination as a patrol leader.

Temp. Sec. Lt. S. A. Oades, Gen. List and R.F.C.

On six different occasions during four months he has driven down three enemy machines which crashed on reaching the ground, and has destroyed two others, causing them to descend in flames. A sixth machine, after he had fired 80 rounds into it, turned over, and went down spinning out of control, but owing to bad visibility it was not observed to crash. In addition to these, he has brought down another three hostile machines out of control, and has always shown the most magnificent dash, gallantry, and determination.

Sec. Lt. (temp. Capt.) E. R. H. Pollak, R.F.A. and R.F.C.

Whilst observing a shoot on a hostile battery he was attacked by two enemy triplanes, one of which he engaged and succeeded in driving off. On the second machine attacking him, his observer being wounded and his forward machine-gun being out of action, he put his machine into a spin down to within 500 feet of the ground, during which time flames began to come out of the engine. These ceased, however, when his machine was once again on a level keel, but on their breaking out again he landed his machine, and was partially successful in extinguishing them. He has always shown great coolness and determination under the most trying circumstances.

Temp. Sec. Lt. J. V. Sorsoleil, Gen. List and R.F.C.

While on patrol with three other scouts he engaged a hostile formation of ten scouts, driving one of these down. While climbing to rejoin his patrol he was attacked by an enemy scout, upon which he opened fire at close range, bringing it down spinning, with the result that it crashed to earth. He has also driven down one enemy machine in flames, and sent another crashing to earth, where it was destroyed. His gallantry and skill have been most conspicuous.

Temp. Sec. Lt. D. A. Stewart, Gen. List and R.F.C.

On one occasion, when returning from bombing an enemy dump, he was intercepted by a formation of 30 hostile machines. He attacked the leader and shot his machine down out of control, whilst his observer shot down another enemy scout. He then fired a burst at another large scout, which dived down vertically out of control. On his observer being hit whilst engaged with another four machines, he spun down 4,000 feet and dived for our lines. Later, when on photographic duty, he was attacked by five enemy scouts, three of which were accounted for by his observer and himself. In the face of heavy odds, his courage, skill, and fine fighting spirit have been most conspicuous.

Lt. (Temp. Capt.) G. H. B. Streatfield, Durh. L.I., Spec. Res. and R.F.C.

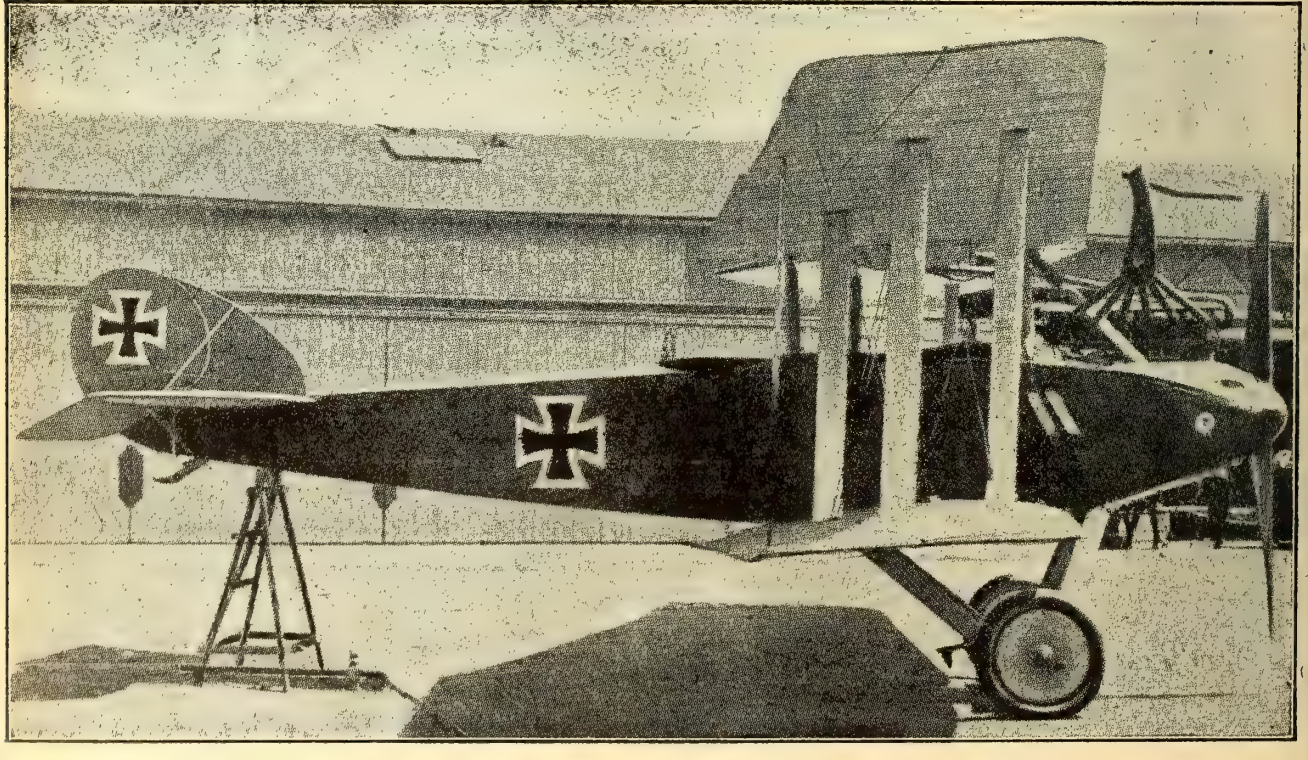
When on photographic work, accompanied by one other machine, he attacked and drove off seven hostile scouts, finally securing some very valuable photographs. On a previous occasion, while on the same duty, he drove off a patrol of five hostile aeroplanes and then continued and completed his photography. On four other successive occasions he successfully drove off numerous enemy aeroplanes, which attempted to interfere with his work. He showed splendid pluck and devotion to duty.

Temp. Capt. G. E. Thomson, Gen. List and R.F.C.

On one occasion when testing his machine he observed a hostile two-seater machine between himself and the lines. He dived on it and fired 60 rounds at a close range, rendering the observer insensible. He then pulled up under the tail of the enemy machine, fired another 30 rounds, and observed it going down in a slow spin. He has accounted for six enemy machines, and has rendered continuous gallant and valuable service.

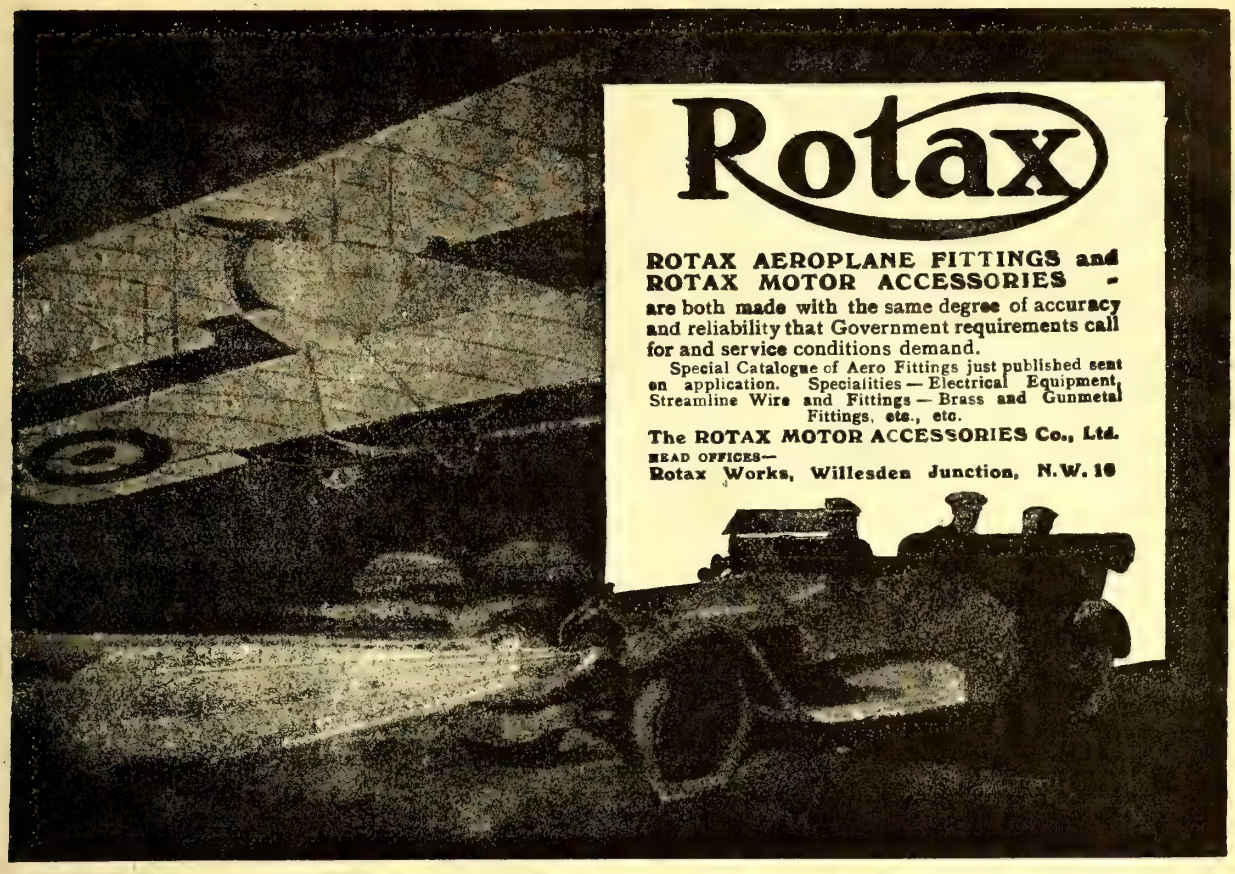
Amendment.

The following is the correct description of an officer upon whom the Military Cross has been conferred :—



Lt. R. A. Austin, M.C., A.F.C. (M.C. gazetted March 26th, 1918).

FROM THE COURT CIRCULAR.



Windsor Castle, April 20th.

The King, attended by the Gentlemen in Waiting, went to London this morning.

The following officer had the honour of being received by the King, when His Majesty invested him with the Insignia of the

Side View of the A G O Biplane, illustrated on p. 1547. The precise position of the three interplane struts may be noted.

Rotax

The Military Cross and Bar.—Lt. Fred McCall, Can. Inf., attd. R.A.F.

The Military Cross.—Capt. Jeffrey Home-Hay, R.A.F. ; Capt. Evans McKay, R.A.F. ; Lt. Gerald Ferguson, R.A.F.

OFFICIAL COMMUNIQUES.

MILITARY.

G.H.Q. Communiqués.

April 16th, 7.54 p.m.—On the 15th inst. the bad weather continued, and only permitted flights at a low altitude.

Over four tons of bombs were dropped by our aeroplanes on different targets. In one case a direct hit was obtained with a heavy bomb on a large column of hostile infantry. No German aircraft were encountered.

One of our machines is missing.

April 17th, 9.5 p.m.—On the 16th instant the mist that has hung over the lines during the last few days turned to drizzle, making flying almost impossible. Movements on the battle front were, however, watched by our machines flying at a very low height and a few bombs dropped.

One hostile machine was brought down and another landed behind our lines.

One of our machines is missing.

April 18th, 8.37 p.m.—During the morning of the 17th inst. there was a slight improvement in the weather, but before mid-day rain and mist again set in. Our aeroplanes were active throughout the day on the Meteren-Wytschaete front bombing the enemy's troops and harassing them with machine-gun fire. Over 500 bombs were dropped by us from a very low height.

There were a few fights early in the day, in the course of which two hostile machines were brought down and one other was driven down out of control.

Four of our aeroplanes are missing.

April 19th, 7.32 p.m.—On the 18th inst. the weather made it impossible during the day to do more than carry out low reconnaissances and to drop a few bombs in the battle area.

At night nine tons of bombs were dropped on Bapaume, Armentières, Warneton, and on the railway junction at Chaulnes.

All our machines returned.

April 20th, 7.50 p.m.—There was no improvement in the weather on the 19th instant, but a certain amount of flying was done by our aeroplanes between storms of rain and snow.

Reconnaissances were carried out at a low height, and four and a half tons of bombs were dropped on Thourout Railway Station, Engel ammunition dump, and targets in the battle area.

Only a few indecisive combats took place.

None of our machines is missing.

After dark our night-flying squadrons were very active.

Sixteen tons of bombs were dropped by them on Armentières, Warneton, Estaires, Bapaume, and the railway junction at Chaulnes. Direct hits were observed on four trains, one of which, judging from the explosions caused, was undoubtedly full of ammunition.

All our machines returned.

April 21st, 8.55 p.m.—The weather improved on the 20th instant, but thick clouds prevented flying at high altitudes. A number of reconnaissances were carried out by our aeroplanes, and some observation work was accomplished in co-operation with the artillery.

Twelve tons of bombs were dropped by us during the day on various targets, including Menin, Armentières, and Thourout railway junction.

Owing to the improvement in the weather, more fighting took place in the air than during the last few days. Six hostile machines were brought down, and three others were driven down out of control.

Three of our machines are missing.

During the night our night-flying squadrons bombed Bapaume, and also the enemy's rest billets and roads leading to the front. Hostile railway junctions were also attacked at Chaulnes, where a large fire was caused, at Juniville (20 miles north-east of Reims), and at Bétheniville.

A total of over 11 tons of bombs were dropped, and all our machines returned.

April 22nd, 9.55 p.m.—After a long spell of stormy weather, which greatly hampered aerial work, the 21st inst. brought a change, and our aeroplanes were able to be in the air from dawn till dark.

The good visibility favoured our artillery, photographic, and long-distance reconnaissance machines.

Bombing was carried out by us incessantly on the whole front. Over 23 tons of bombs were dropped on Thourout railway station, Menin, Armentières, Chaulnes, and various other targets. Thousands of rounds of machine-gun ammunition were fired by our low-flying machines.

The enemy's machines were seen in large numbers, but were not aggressive. Eleven German machines were brought down in air fighting, and six others were driven down out of control. A hostile observation balloon was also destroyed. Our anti-aircraft fire shot down two other hostile aeroplanes.

Five of our machines are missing.

The pilot of one of the hostile machines which was brought down in combat, and fell in our lines, was the well-known German aviator and fighter, Rittmeister Freiherr M. von Richthofen, who claimed to have brought down 80 Allied machines. His body has to-day been buried with full military honours.

During the night of the 21st instant our night-flying machines again bombed Armentières, Bapaume, Chaulnes railway junction, and Péronne, dropping in all nine and a half tons of bombs.

All our machines returned.

War Office Communiqué.

April 18th.—The G.O.C. Italy reports :—

Yesterday was the first fine day for some 10 days, and led to much aerial activity. Several successful long-distance reconnaissances were carried out. There was heavy fighting in the air ; 11 enemy machines were destroyed and one driven down out of control. None of our machines is missing. In addition, one enemy aeroplane was brought down to-day by our anti-aircraft fire.

THE CASUALTY LIST.

NAVAL.

Reported April 18th.

Previously reported Missing, now Officially Presumed to have been Killed.—Dixon, Flt. Lt. J. F., D.S.C., R.N.

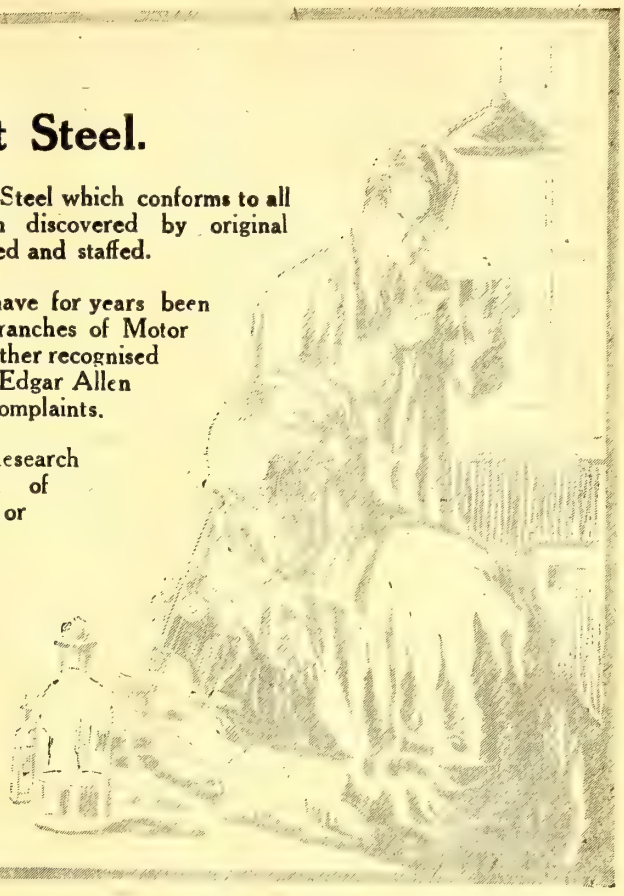
Finding the Right Steel.



IN EVERY engineering process there is one Steel which conforms to all the technical requirements. It has been discovered by original research work in a laboratory suitably equipped and staffed.

The Edgar Allen Research Laboratories have for years been employed in defining the correct Steels for all branches of Motor and Aircraft manufacture. All Government and other recognised specifications are complied with. By specifying Edgar Allen Steels, engineers will be relieved of all anxiety and complaints.

The services of the Edgar Allen Research Laboratories are placed at the free disposal of Engineers submitting confidentially any problems or difficulties.

Allen's Catalogue D (Motor and Aircraft-Steels) gives the specification and test-numbers of all steels required. (Post Free.)

B., D.C.L.I., attd. R.F.C.; Wilson, Capt. C. B., Hussars and

Reuter's correspondent at The Hague reports that the latest list of British officers prisoners of war arriving in Holland for internment includes the following: Fairbairn, Sec. Lt. J., R.F.C.; Morrison, Lt., R.F.C. (65th Sqdn.); Snook, Capt. C. W., R.F.C.

* * *

Capt. Sidney Smith (Flt. Comdr.), R.F.C., has been missing since April 6th. Any information from officers and men will be gratefully received by Mr. and Mrs. Arthur Smith, of Morningside, Aldershot.

PERSONAL NOTICES.

NAVAL.

Death.

DIXON.—On the 13th inst., at a nursing home, Josephine, the dearly-loved wife of Ernest Harry George Dixon, R.N.A.S., of 70, Kensington Gardens Square, W., on active service with the British Aegean Squadron, aged 29 years.

* * *

The "Times" correspondent states that Flt. Lt. J. F. Hay, R.N., was among those officers who arrived in Holland for internment on April 18th.

MILITARY.

Deaths.

AITCHISON.—Lt. Douglas James Aitchison, R.F.A., attd. R.F.C., who died on April 17th at the R.F.C. Hospital, Hampstead, as the result of blood-poisoning following an aeroplane crash on active service, was the younger surviving son of the late James Aitchison and of Mrs. Aitchison, of Kismet, Beckenham.

BRABROOK.—Sec. Lt. Edward John Brabrook, R.F.C., who died of wounds received in action on April 20th, was the only son of the late Edward Frederick Brabrook, LL.B., and grandson of Sir Edward William Brabrook, C.B.

GRANT.—Lt. Eric Duncan Grant, whose death was announced last week, was at the time of his death engaged as an instructor at an Australian aerodrome. He gave promise of brilliant work at the front, where he was about to proceed.

GRIGSON.—Sydney Mark Grigson, A.F.C., who died on April 17th at the Central Military Hospital, Aylesbury, was the younger son of Dr. R. E. and Mrs. Grigson, Sydney, New South Wales. He was 20 years of age.

KING.—Lt. William Hugh King, N. Staffs. R., attd. R.F.C., who was killed on April 11th through an accident when returning from a raid, was the eldest son of Mr. and Mrs. William Hedley King, of Inglis Road, Colchester. Born in 1894, he was educated at the Royal Grammar School, Colchester, and on leaving went to Germany, where he acquired a thorough knowledge of both the French and German languages. He adopted engineering as his profession, and was articled to Davey, Faxman, and Co., Ltd., of Colchester.

He enlisted immediately after the war broke out, and soon afterwards obtained a commission, being gazetted second lieutenant in the Essex (Cyclist) Battalion; he was promoted lieutenant in July, 1917. He went to France in March, 1917, and was for some time attached to the 2/5th North Staffordshire Regiment and later was engaged for some months at the headquarters of the XV. Corps, on account of his fluent knowledge of both the French and German languages. In November, 1917, he obtained a transfer as observer in the Royal Flying Corps, and returned to England for a course of training. He passed all examinations with distinction and was highly commended, and left for the front again early last month.

MACRAE.—Capt. John Nigel MacRae, R.A.F., who was killed in a flying accident on active service on April 11th, aged 22, was the younger son of Stuart MacRae and Mrs. MacRae, Handley House, Newark. He was educated at Messrs. Carse and Sams, Brighton, and at Malvern College.

At the outbreak of war he was in the Sherwood Rangers Yeomanry, which he left shortly afterwards to join a battalion of the Black Watch commanded by his uncle, Col. MacRae Gilstrap of Eilean Donan. He had for a long time wished to fly, and in October, 1915, he joined the Royal Flying Corps. He got his wings on February 1st, 1916, and went out to France the following month for eight months. He was gazetted flight commander in January, 1917, and after instructing in England for 14 months, again went to the front on March 5th last.

MAYBERY.—Capt. Richard Aveline Maybery, M.C. (with bar), Lancers, attd. R.F.C., who was previously reported missing and is now reported killed, was born at The Priory, Brecon, and was 22 years of age. He was educated at Connaught House, Weymouth, and Wellington, Berks, distinguishing himself at games at both places. From Wellington he won a prize cadetship at Sandhurst, and after two terms passed out fifth, winning the first prize for field engineering, tactics, and strategy.

He was gazetted to the — Lancers in September, 1913, and joined his regiment at Rawal Pindi. He served through much fighting on the Indian frontier, being part of the time A.D.C. to Gen. Crocker. He was dangerously wounded in the fight at Shrabkadr, and, being unable for some time to sit a horse, he took up flying. He was sent to Egypt, and after a short course in England, where he made a record flight, he went out to France in June, 1917, and won the M.C. in July and a Bar in October.

His C.O. in the R.F.C. writes: "Capt. Maybery was, I think, the bravest and most dashing air-fighter I have ever come across, and, of course, his career here has been brilliant

He set a wonderful example to the newer pilots. He has done a tremendous lot of good in this war. He and Capt. Ball and Lt. Rhys Davids did more harm to the moral of the German Flying Corps than any other 15 pilots between them. They all, always, took on any odds—they were too brave and reckless."

MEREDITH.—Sec. Lt. Owen Watkin Wynn Hardinge Meredith, R.F.C., was the only child of the late the Venerable Thomas Meredith, late vicar of Wolston and Archdeacon of Singapore, and of Mrs. Meredith, of Park Road, Leamington. He was educated at Harrow and Cambridge University. He distinguished himself in all mechanical examinations in London, and was an excellent shot when going through his course of gunnery. At an aerodrome in England he made a record for high flying. He obtained his wings in July, 1917, and went out to the front in October, 1917. He was reported missing on Nov. 20th, 1917, near Cambrai, and is now known to have been killed in action on that date at the age of 24.

ROWDEN.—Maj. and Sqdn. Comdr. Cuthbert Roger Rowden, M.C., Worcs. Regt. and R.A.F., who was accidentally killed whilst flying in Essex on April 20th, was the husband of Frances Rowden (née Jobson), and only son of A. Roger Rowden, Hillend, Eastnor, Ledbury. He was 21 years of age.

WHITEHEAD.—Sec. Lt. Eric Alfred Whitehead, R.F.C., aged 19, was reported missing on March 13th. Later accounts make it clear that he was killed on that day while on patrol duty. He was the younger son of Professor and Mrs. A. N. Whitehead, of 97, Coleherne Court, South Kensington, and was born at Cambridge, educated at Mr. Gladstone's preparatory school, Cliveden Place, S.W., and Westminster School, and had been admitted 'to Balliol College, Oxford. He served for one year in the R.F.C., being employed in England as an instructor after obtaining his pilot's wings. At his own request he was sent to the front in February this year.

Marriage.

WHITFIELD—BYRNE.—On April 18th, at Christ Church, Broadway, Westminster, Lt. J. Miller-Whitfield, R.E., attd. R.A.F., of Toronto, Canada, was married to Nancy Adele, daughter of Mrs. W. H. Byrne, of Ealing, by the vicar, the Rev. R. J. Campbell.

Births.

DARWEN.—On April 17th, at 18, Dunstan Road, Hampstead, the wife of Lt Jack Darwen, R.F.C., of a daughter.

PLANT.—On April 19th, at Euston, Norfolk, the wife of Lt. L. H. Plant, R.F.A., attd. R.A.F., of a daughter.

WARING.—On April 16th, at 80, Ashley Gardens, S.W., the wife of Capt. C. H. Waring, Hussars and R.A.F.—a son.

AIR FORCE.

Deaths.

GASTER.—Sec. Lt. Gaster, R.A.F., was killed while flying in Scotland on April 21st.

MILDMAY.—Sec. Lt. Bouverie Walter Mildmay, R.A.F., who was reported killed on April 16th, was the only son of the Rev. and Mrs. Arundell St. John Mildmay, of Old Wolverton Vicarage, Bucks. He was 19 years of age.

MOONEY.—Sec. Lt. Mooney, an American Army officer, attd. R.A.F., was killed on April 22nd while flying in Surrey. His engine suddenly stopped and the machine fell on a railway, where it caught fire. A train which was due to pass the spot where the accident happened was stopped by a signalman.

PALMER.—Lt. Bryan Barrington Palmer, R.A.F., who was killed while flying on April 17th, was the elder son of Mr. and Mrs. T. H. B. Palmer, of 1, Sutton Court, Chiswick, late of the Ivy House, Bushey, Herts. He was 19 years of age.

ROBINSON, CLAYTON, and HOWELL.—Lt. Harry Estcourt Robinson, R.A.F., and Sec. Lt. John Alfred Clayton, R.A.F., while flying over Yorkshire on April 21st, came into collision at a height of 2,000ft. with another aeroplane piloted by Lt. Evan Idris Howell, R.A.F.

Both machines crashed to the ground, the three occupants being killed instantly.

Lt. Harry Estcourt Robinson, R.A.F., was the son of Mrs. Venetia Jefferson, of Drayton House, Colebrooke Avenue, West Ealing, and of the late Maj. James Estcourt Robinson, E. Lancs. Regt. He was 19 years of age.

Engagement.

HAY—LIDDELL.—A marriage has been arranged, and will take place on May 16th, between Capt. John Crawford Matthew Hay, R.A.F., second son of Professor Matthew Hay, M.D., LL.D., of Aberdeen University, and Mrs. Matthew Hay, and Mary Monica, second daughter of Mr. and Mrs. John Liddell, of Sherfield Manor, Basingstoke.

Marriages.

GOODFELLOW—BOSTON.—On April 17th, at Trinity Wesleyan Church, Southport, Capt. Alan Goodfellow, R.A.F., son of Mr. and Mrs. B. Goodfellow, of Birkdale, and grandson of the late Reuben Spencer, of Manchester, was married to Christine Mary, daughter of the late John Boston and Mrs. Boston, of Birkdale, and granddaughter of the late James S. Sutcliffe, of Bacup, by the Rev. Allan Spencer, assisted by the Rev. Scott Page.

JEFFERSON—CHESHIRE.—On April 17th, at the Parish Church, Neston, Maj. Elgie Blyth Jefferson, R.A.F., son of Mr. and Mrs. Jefferson, of Ballahott, Isle of Man, was married to Muriel, eldest daughter of Mr. and Mrs. Holland Cheshire, of Hallwood, Neston, Cheshire, by the Rev. C. Brooke Gwynne.

MACKIE—MONDAY.—On April 13th, 1918, at St. Stephens' Church, Albert Square, Clapham Road, S.W., Serjt.-Maj. Douglas Mackie, R.A.F., of Hamilton, Scotland, was married to Ethel Lavina, second daughter of Mr. and Mrs. W. H. Monday, of 86, Fentiman Road, Clapham, S.W., by the Rev. R. G. Grundy.

WOOD—AMOS.—The marriage arranged between Capt. Herbert Lee Wood, R.A.F., eldest son of Mr. and Mrs. Lee Wood, of Oakwood, Clifton, Lancs., and Nora Frances, only daughter of the Rev. Andrew Amos, rector of Deptford, and Mrs. Amos, took place at St. Paul's Church, Deptford, on Saturday, April 20th, at 11 a.m.

Births.

DOWLING.—On April 12th, at 22, Bardwell Road, Oxford, the wife of V. Laidley Dowling, R.A.F., of a daughter.

GARRETT.—On April 17th, at Sunnyside, Cradley, near Malvern, to Florry Rose, wife of Lt. Sidney F. Garrett, R.A.F.—a son.

RANGER.—On April 17th, at Kimbolton House, Alleyn Park, West Dulwich, the wife of Lt. C. P. Ranger, R.A.F., of a son.

RYDON.—On April 14th, at Awbrook, near Haywards Heath, the wife of Capt. H. E. Rydon, R.A.F., of a daughter.

FOREIGN COMMUNIQUES.

FRANCE.

April 16th.—Allied aviators carried out several bombardments of the enemy's establishments in the Vardar valley and in the region of Seres.

April 17th.—During the 15th and 16th inst. four German aeroplanes were brought down by our pilots. It is confirmed that two other enemy machines were destroyed on April 12th in an air fight.

April 20th.—During the night of April 18th-19th about four tons of projectiles were dropped by 15 of our aeroplanes on the

THE
"Aeroplane" Blue Book 1918
A DIRECTORY OF AIRCRAFT FINANCE
By G. A.
Financial Editor of the "Aeroplane."

THE large and increasing number of Aeroplane Companies make it an urgent necessity to the many interested in the Industry to have, in a concise and handy form, a reliable Work of Reference. "The Aeroplane Blue Book" contains particulars of all the principal public Aeroplane and kindred Companies, giving:—

The Capital of each Company and how divided.
The Amount issued and paid up. Loans and Mortgages.
Names of Directors and other Officials.
Registered Offices. Date of Incorporation.
Profits and Dividends paid and declared.
Date of making up Annual Accounts and when submitted.
Extracts from last Balance Sheet and Directors' Reports.

landing ground of Champion, and on bivouacs in the region of Ham, Noyon, and Guiscard. During the day of the 19th instant 13 of our machines in the course of two flights dropped 1,850 kilogrammes (over 1½ tons) of explosives on enemy organisations in the region of Roye and Moreuil.

Seventy aeroplanes, during the night of April 19th-20th most successfully bombarded the station of St. Quentin and numerous railway lines in the region of Jussy, as well as the aviation grounds. More than 15 tons of explosives were dropped. Another group of seven machines bombarded the stations of Montcornet, Asfeld, Hirson, and the aerodrome of Clermont-les-Forges. Patrols of aeroplanes flying at a low altitude machine-gunned resting troops.

April 21st, Army of the Orient.—An enemy machine was brought down by British aviators north-east of Petric.

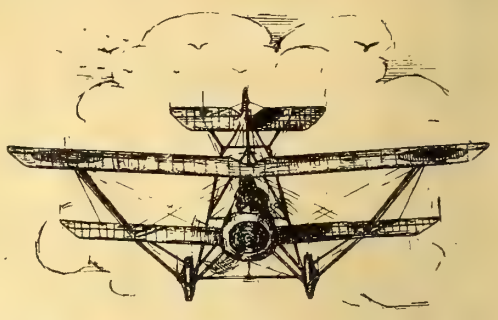
April 22nd.—During the 20th and 21st four German aeroplanes and two captive balloons were destroyed by our pilots, and a fifth aeroplane was brought down by infantry fire. In addition, 16 enemy machines fell in their own lines in a badly damaged condition, after aerial combats.

During the same period our bombarding machines carried out numerous operations. Forty-nine thousand kilogrammes (49 tons) of projectiles were dropped on railway stations, camps, and aerodromes in the region of St. Quentin, Jussy, Chaulnes, Noyes, Ham, Guiscard, and Asfeld.

Two fires broke out in the railway station of Chaulnes, and in the station of Asfeld. An ammunition dump to the east of Guiscard blew up.

It is confirmed that an observation balloon and three new aeroplanes have been brought down, one by means of our anti-aircraft defences.

GERMANY.



April 21st.—Rittmeister Baron von Richthofen, at the head of the trusty chasing squadron, gained his 79th and 80th and Lt. Buckler his 31st aerial victory.

On the evening of April 13th, a fire broke out at the Friedrichshafen yards, involving also a former Zeppelin hangar. The fire was quickly subdued, and the damage is slight. Work at the yard continues without interruption.

ITALY.

April 18th.—During yesterday five enemy aeroplanes were brought down by our aviators in the region of Valdobbiadene and Conegliano [north of the Montello]; British chasers cruising from the Asiago Plateau to Motta di Livenza [a distance of 60 miles]

shot down 11 more hostile machines while a twelfth was compelled to land.

A seaplane was hit by anti-aircraft guns, and fell into the sea near Porto di Piave Vecchia; the three aviators who manned it were taken prisoner.

April 19th.—A British anti-aircraft battery shot down an enemy aeroplane in the neighbourhood of Rotzo [two miles east of the Astico and five miles north-north-east of Arsiero].

AUSTRIA.

April 18th.—In Albania Actg. Officer Arrighi achieved his 24th aerial victory.

April 21st.—Capt. Brumowsky gained a victory for the 29th time in aerial battle.

THE WAR IN REVIEW.

Great Britain and Italy.

The "Times" correspondent writes from Rome on April 11th that Signor Orlando, the Prime Minister, in the course of an interview he granted me, referred particularly to "the good feeling that has always existed and at this moment exists with more intensity than ever between Italy and Great Britain."

I should like the British people to know (Signor Orlando continued) that Italy has not been content at this moment with mer expressions of solidarity, however sincere. Our Capronis ar operating on the battle front in France, beside British an French air squadrons, and the formations we have sent to Fran comprise some of our best machines and best fliers.

More Aces.

It is reported by the Paris newspapers that Flt. Sub-Lt. G Meuldre has brought down his twelfth enemy machine, whil Flt. Comdr. Mossenet has just brought down his sixth.

It is reported that Lt. Fonck has brought down his 35 enemy aeroplane.

A Private Opinion.

The special correspondent of the "Morning Post," writir from the French Front on April 19th, says:—

"German aviation," a staff officer said to me, "does n exist. There are two principal reasons for this, the first bei *la casse*—in other words, the tremendous wastage caused in inc sant attacks delivered on enemy aeroplanes by British and Fren pilots. The bombing of aerodromes as the wisest method of rep to the attacks made by the Germans on undefended towns effecting its object, and we are forced to the conclusion that Ge many to-day suffers from lack both of men and machines. know that Germany had taken the desperate step of calling up men from munition works to put into the line. From the way in which she has thrown her divisions into the battle, it is obvious that she believes she is playing her trump card. We have seen that she has been, and still is, exerting her full strength, and if she had aeroplanes available there is no doubt but that she would have made full use of them, as we have done, for observation purposes, to prevent the bringing up of reinforcements, and to disorganise the troops on the actual field of battle. She has done none of these things effectively.

"The conclusion seems manifest that it is because she has not the necessary force available. In any case the fact remains that German aviation has ceased to be a Force to be seriously reckoned with." I am in a position to supplement the remarks of the staff officer by a single statement based on information that at present cannot be disclosed. In the last four weeks the situation, which, on several occasions, has necessarily been delicate, would have been very much more so had the Germans been equipped with an adequate air service to supply them with definite observations.

But Why Agree?

Reuter reports that in the Reichstag on April 16th the Socialist Deputy Herr Gock suggested that an agreement should be reached for the cessation of aerial attacks on open towns outside the war zone.

A member of the Government said that no official request to that effect had yet been received from the enemy Powers. If such a request should be received, it would be examined by the military authorities.

The Crossing of the Sahara.

The "Echo de Paris" says that the crossing by aeroplane of the Sahara, the half of which had already been carried out for the first time, has now been completed by three machines which left Ouargla and arrived at Salah, having completed the trip in seven hours with a solitary landing at Inifel.

The "Petit Parisien" of April 22nd says that Lt. Bernand, a native of Lyons, has carried out a daring raid with a squadron in Southern Algeria, flying 1,300 kilometres (807 miles) to bomb cantonments of hostile Touaregs.

[The second paragraph evidently refers to the same flight as the first, but the correspondent apparently did not know that "raid" is only the French word for "ride," and merely indicates an unusual journey, so apparently he invented the Touaregs to give artistic verisimilitude.—Ed.]

America in the War.

Reuter's correspodent with the American Army in France writes on April 20th:—

Twelve hundred German "shock" troops attacked to-day the American positions west of Remières Forest, north-west of Toul.

Two German aeroplanes were brought down during an engagement, after a futile attempt by them to machine-gun American troops.

Compensation.

Reuter's correspondent at The Hague writes on April 22nd:—

The Foreign Office here announces that the British Government has paid an additional sum of 27,023 guilders, thus settling all the claims on account of the damage done on the night of April 29th, 1917, at Zierikzee by bombs thrown by a British aeroplane.

English Evictions.

The "panic-stricken hordes of aliens who desire to avoid the ambit of enemy air-raiders in London," are to be countered by the Increase of Rent (Amendment) Bill, which was read a second time in the House of Commons on April 17th. It has already passed through the House of Lords.

Under the original Act landlords were allowed to evict tenants of houses below a certain rental if they required the houses for their own occupation. The new Bill provides that from a given date—at present fixed at March 12th—the only landlords who can avail themselves of this exception clause will be those who owned the property at that date, or those to whom the property had devolved by settlement or will.

[After all, English evictions are a pleasing change after centuries of Irish evictions.—Ed.]

An Off Chance.

The "Times" correspondent with British Headquarters writes on April 21st:—

An official *communiqué* has, I think, told you of a curious incident, when British and German machines came into collision in the night and both came down in flames.

[One can trace no reference to this incident in any communiqué.—Ed.]

A Third-Party Accident.

Several villagers were watching an aeroplane which was forced to descend by engine trouble near Bath on April 19th when the machine crashed into them. Mrs. Rhoda Mortimer had her skull fractured and died in Bath Hospital afterwards, and other persons were injured, though not seriously.

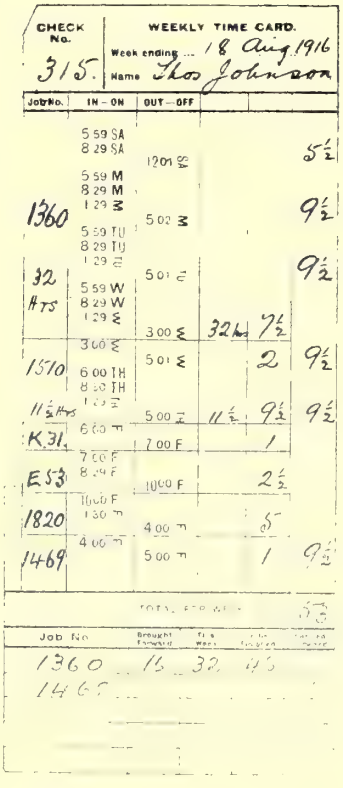
COMBINED TIME AND JOB CARD

for recording complete labour cost.



The "**IN**" and "**OUT**" time is recorded on the card, also the time when jobs are changed.

The TIME on the Job is cast out at the side of card and the total hours entered in the Job No. column under the Job number.

Unfinished Jobs are entered at the foot with Job number and the total hours worked up to the week-end under column headed "Carried Forward," and transferred to the next week's time card in the column "Brought Forward," any time worked on this job during the second week is entered in the column, "Time for this Week." If the job is completed during the second week, the total is added and entered in the "Jobs Finished" column. If the job is not completed, the total is entered in the column "Carried Forward," which will in turn be entered on the third week's time card.

STANDING ORDER NUMBERS for constantly re-curring Non-Productive Jobs are represented on the card, e.g. K.31 Grinding Tools; E.53 Making a New Lathe Tool.

ON LORD ROTHERMERE'S RESIGNATION.

Much as all will sympathise with Lord Rothermere in the mental and bodily afflictions which he has given as the reasons for his resignation from the post of Secretary of State for the Air Force, it is hard to find in them either excuse or justification for his method and manner of handling the affairs of the Air Council so that the recently observed results should have accrued.

Lord Rothermere assumed office with a flourish of triumphal music from the sacred conches of Fleet Street. We were assured that he was a strong man, of vast organising ability, that he had made the Army Clothing Factory in Pimlico a model of productive fertility, that to him the running of multiplied newspapers was a simple business proposition, and that if from the Hotel Cecil—sanctified by the presence in the past of all the great commercial minds, and travellers, of the world—he did not propose to organise a new Heaven and new Earth he would, at any rate, give us a new Air, purified of the Hunnish microbes which therein float.

In the event we find him weak, a very shorn Samson, easily influenced in wrong directions, driving blindly at a task which he did not understand, which—being a military task—he was possibly incapable of understanding, and which he was too headstrong to sit still and study. The methods which perchance sufficed to comb grafters out of a Pimlico slop-shop—if they sufficed, for it is not certain that they did so—were not applicable to the higher and newer problems of war.

His brief career at the Hotel Cecil has been entirely regrettable. It is impossible to trace one act of his which has in any way assisted towards winning the war, towards developing the use of aircraft, or towards promoting order in that establishment. Bad as was the state of the place whose manners and customs won for it the pseudonym of the Hotel Bolo, its confusion is now merely worse confounded. Primeval chaos would appear as convincingly orderly as the carefully laid-out prospectus of one of Lord Beaverbrook's projected Canadian cities of the plain if compared with the organisation of the Air Ministry as Lord Rothermere left it.

Lord Rothermere's Letter.

When he assumed office he entered upon a big task. He has left a bigger task to his successor. His letter of resignation shows how little he appreciates either what he had to do or what he has done. Here is the text of that amazing document:—

Hemsted, Benenden, Kent,
April 25th, 1918.

My dear Prime Minister,—I desire to relinquish my office as Secretary of State of the Air Force at the earliest possible date.

The Royal Air Force is now one of the three established fighting Services of the Crown. The fusion of the Royal Naval Air Service and the Royal Flying Corps has been successfully accomplished.

At times I have thought I would not be able to accompany the new Force so far. My second tragic loss in the war ten weeks since caused and causes me great distress of mind and body. Every day the burden of work and responsibility seemed crushing, and I was suffering much from ill-health and insomnia. I felt, as I told you, my urgent primary duty to the Government and the nation required me to remain, if at all physically possible, until the date of the fusion, and such time after as would suffice to establish the success of the amalgamation. My departure before might have gravely deranged what is now one of the nation's arms of war and have jeopardised the success of the whole scheme. Lately I thought I might be able to remain, but a recurrence of bronchial trouble with insomnia effectually prevents this.

I have entered into these particulars because I wish you to know the difficulties under which I have been working.

I cannot close this letter without expression of my great regard and respect.—Yours very faithfully,

ROTHERMERE.

The Right Hon. the Prime Minister.

That the R.A.F. is an established fighting force is no thanks to Lord Rothermere, and if he had written "con-fusion" instead of "fusion" in his first sentence he would have been nearer the facts. Why he should assume that his departure should gravely derange one of the nation's arms of war is not self-evident. On the contrary, events have rather given one to think otherwise and oppositely.

From one who is said to be so strong a man one would have preferred to see a plain straightforward and dignified letter resigning his office without explanation. If he felt that he could not do the work there was no need for him to retire behind a smoke-screen of sentiment. Mr. Asquith made no such complaining.

Mr. George's Letter.

Mr. George's letter appears as the effort of one turning onto a smoke-screen a searchlight beam which, as such beams do, instead of illuminating the view of those whom it is supposed to assist, merely camouflages the real object the more effectively. Mr. George was ever a chameleon for protective colouring. The letter deserves the fullest possible publicity, so one does one's humble best to help:—

10, Downing Street, S.W.1.
April 25th, 1918.

My dear Rothermere,—I have received your letter tendering your resignation as Secretary of State for the Air Force with the deepest regret. Your work there has been of inestimable service to the nation, and time will bring with it a full recognition of your achievement.

It is no small thing to have taken over the conduct of an entirely new arm of the Service in the middle of a great war, to have extricated it from the difficulties which surrounded it, co-ordinated the two Services which made it up, and bestowed on its administration an initiative which has given the new force a real supremacy at the front. And all this has been done in such a brief period of time.

It is the more to be lamented that, having set the Ministry on its legs, you cannot remain to enjoy the fruition of your own brilliant work.

But I feel on reading your letter that I cannot press you to stay, much as the Government must suffer from your retirement. Your sacrifices to the national cause have been so heavy and the strain imposed on you so cruel that it would be impossible to deny you the right to some repose. Sympathy in these matters is generally best given by silence, but I am sure that you know without my telling you how much I

sympathise with you in your losses and in the way in which you have continued your public duties in spite of everything.

No Minister ever had greater difficulties to contend with than you had in effecting the fusion of the two Services, and the Air Force has every right to be proud of its first Secretary of State.

I am authorised by my colleagues to state that they share fully the views I have expressed in this letter.—Yours very faithfully, D. Lloyd George.

Possibly Mr. George's use of the ambiguous word "inestimable" in the second sentence is not intentional. That which is impossible to estimate may be either infinity or zero.

However, Mr. George is still more skilfully ambiguous in the second paragraph. It is not frequently possible simultaneously to agree with Mr. George and with the truth. Yet here one can do both. It is certainly no small thing to have done so much, as he says.

To take over a new arm in the middle of a great war, to extricate it from difficulties, to co-ordinate two Services, and to give the new Force a real supremacy at the front is a very great thing. It was done by General Trenchard between April, 1915, and the autumn of 1917. It was done before anyone ever heard of Lord Rothermere in connection with the affairs of the air.

The R.N.A.S. squadrons in France were co-ordinated excellently with the R.F.C. At home Lord Cowdray and Sir William Weir co-ordinated supplies for both Services. They were Sir Hugh Trenchard's real supporters—they and his excellent brigade-commanders at the front and his equally able training division commanders at home. These are the people who from the weakness of 1915 gave the new Force a real supremacy in 1917.

Lord Rothermere had nothing whatever to do with it. And Mr. George is wily enough not to say that he had. He merely says that what has been done was no small thing to do, and he leaves the doers anonymous.

In the next paragraph, however, Mr. George gives Lord Rothermere credit for having set the Air Ministry on its legs—which is quite a different matter from having given the new arm supremacy at the front. Here again Mr. George's words and the truth are parallel, if not coincident. Whatever credit, or blame, may attach to bringing the Air Ministry into being certainly belongs to Lord Rothermere, but it is well to remember that work may be brilliant without being in the least useful or even sensible—as, for instance, the embroidery on an R.A.F. cap.

At the very end Mr. George is as cleverly ambiguous as in his earlier phrases. It is again possible to reconcile his words with the truth when he says that no Minister has ever had greater difficulties than had Lord Rothermere in effecting the fusion of the two Services. The greater difficulties pertain to Lord Rothermere's successor, not to any predeceased Minister, for the fusion has still to be effected and the confusion is greater than before.

Not only Mr. George's colleagues but all who are on the inside of Air Force affairs will share fully the views which Mr. George expresses in his letter, and will share still more fully the views which he has still more skilfully avoided expressing, though one has endeavoured to do so for him. When one reads his letter with proper care one perceives how very early in the morning it is necessary to arise if one desires to catch Mr. George even half-asleep.

The Temple of Dagon.

One is sincerely sorry for Lord Rothermere, this modern Samson Agonistes. He was ill-advised ever to tackle the job, and he was seemingly worse advised after he had taken it.

There are many points in Old Testament history which leave one intrigued as to facts of interest. We are told in Judges xvi, 26, that Samson was led by a lad who indicated to him the main pillars of the temple of Dagon whereupon the house stood, and in verse 29 that he took hold of the two middle pillars, and, in verse 30, that he bowed himself with *all his* might, and that the house fell upon the lords and upon all the people that *were* therein, and that he himself perished in the crash.

But we are not told who was the lad who indicated the king-posts, nor whether he had the gumption to stand from under when he saw the crash coming. Such information would have added materially to the interest of the story.

Similarly one would very much like to know who was the lad who guided Lord Rothermere to the pillars of the Air Force Temple, and whether he got out in time to enjoy the performance. Aviators are so clever in dodging crashes that it seems possible that he did so.

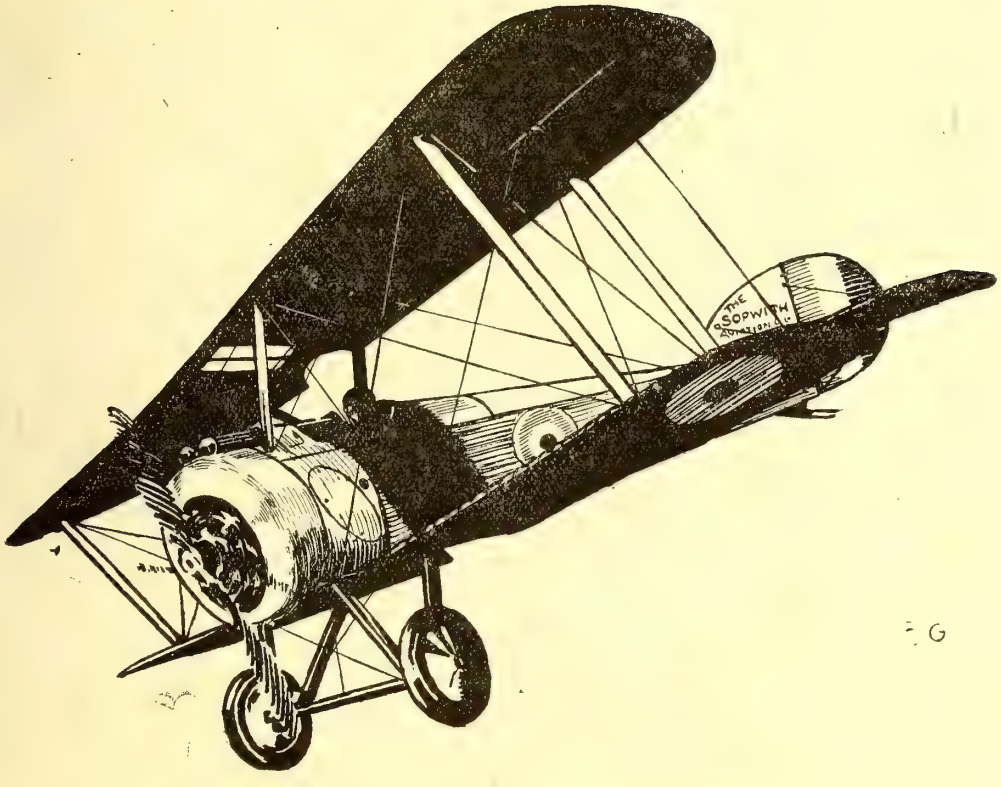
One feels sure that the surviving Philistines built a very much better temple out of the wreckage, much as the A.S.Ds. at the front build better aeroplanes out of salvage. Probably they called in an experienced engineer to do the job, and he probably built the new place with a proper factor of safety, and with duplicated pillars, so that if anyone went blundering into them by accident or by intent he would not bring the whole place tumbling round his ears. And probably the engineer was a Clydeside Scot.

The Great Consolation.

One commends to Lord Rothermere, for the consolation of his lacerated soul, the words of one of the really great men of history. Abraham Lincoln, in his famous speech at the dedication of the National Cemetery at Gettysburg on November 19th, 1863, said:—

"The brave men, living and dead, who struggled here, have consecrated it far above our power to add or detract. The world will little note nor long remember what we say here, but it cannot forget what they did here.

"It is for us, the living, rather, to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us; that from these honoured dead we take increased devotion to that cause for which they gave the last full measure of devotion; that we here highly resolve that these dead shall not have died in vain."



Work is the great consolation in all great sorrows. When that work is devoted to advancing still further the cause for which those dear to us have died we then find the greatest consolation. To-day one can point to scores of fathers, mothers, sisters, and brothers who are working earnestly for the advancement of aviation, and for the good of those who fly, because—not in spite—of the deaths while flying of those dearest to them.

They dedicate themselves to the great task remaining before them. And they find their consolation in that task. One knew such people before this war, when only a few of us were concerned in our little private war for the Conquest of the Air, a war which in proportion to the numbers engaged was as deadly as is this great world war. And one knows such people among those who have lost their sons and brothers in this newer war. They are the aristocracy of the Nation.

The Political Aspect.

However, there seems but little doubt that Mr. George and his friends had made up their minds, very soon after the outburst of feeling over the upheaval at the Air Ministry became manifest, that Lord Rothermere was to be thrown to the lions—if one may outrage zoology by likening politicians to such forceful mammals. Had it been the intention of the Government to stand by the Air Minister, when Mr. Pringle raised the question,

21, RUE DU MONT THABOR.

on the adjournment of the House of Commons on April 18th, he would have been duly crushed by Mr. Law or Major Baird, or if necessary by Mr. George himself.

The questioner being thus abolished the question would have been settled for good and all, until the Air Force Vote came to be discussed. By that time affairs at the Air Ministry might have settled down. Such is the trick of the trade as worked in Parliament.

But Mr. Law and Mr. George, having the keenest of political noses, scented the big trouble which was brewing and promised to give a full day, of the time in which the governing of the nation should be discussed, to a debate concerning the removal of a general. It is true that seldom has the House had an opportunity of spending its time on a better subject, but such a subject ought never to need discussion.

In any event the mere permission of such a debate meant throwing Lord Rothermere into the political arena to be torn to pieces by lions and jackals alike. And apparently Lord Rothermere, not having the spirit of a martyr, stood not upon the order of his going, but beat it for the tall timber of his baronial estate.

A New War.

Possibly the sacrificial tendencies of Messrs. George and Law were aggravated by a knowledge that either they intended to quarrel with Lord Northcliffe, or that Lord Northcliffe intended to quarrel with them. For, it has since been consistently rumoured—it may by now be confirmed—that Lord Northcliffe is resigning his post as chief propagandist in foreign parts.

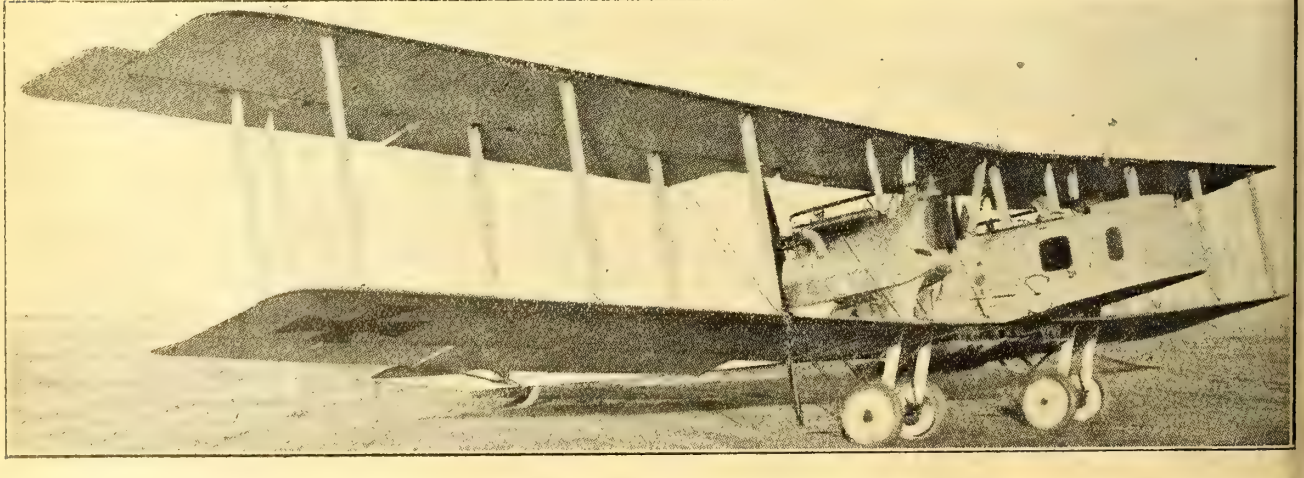
This would seem to portend a war between the Multiple Alliance of the Harmsworth Press and the Double Entente of the Government. Such a fight should be vastly entertaining, and will probably be much appreciated as a little welcome comic relief by the real fighting men at the real front. The great majority of thinking people will watch the scrap with perfect impartiality, and will be strictly neutral, with perhaps a slight desire for a result similar to that which was alleged to have ended the battle of the Kilkenny cats.

The forthcoming campaign on the Fleet Street-Strand-Westminster front seems to turn on the inclusion of Lord Milner and Mr. Austin Chamberlain, two honest and able gentlemen, in the Cabinet, and on prospective doings at the Air Ministry. Readers of this paper will probably only be interested in the reinforcements, reserves, and casualties on the Bolo sector of the Strand front, and on these matters one hopes to be able to keep them well informed, even if the strategy and tactics employed may be too complicated for public discussion or comprehension.

The New Air Minister.

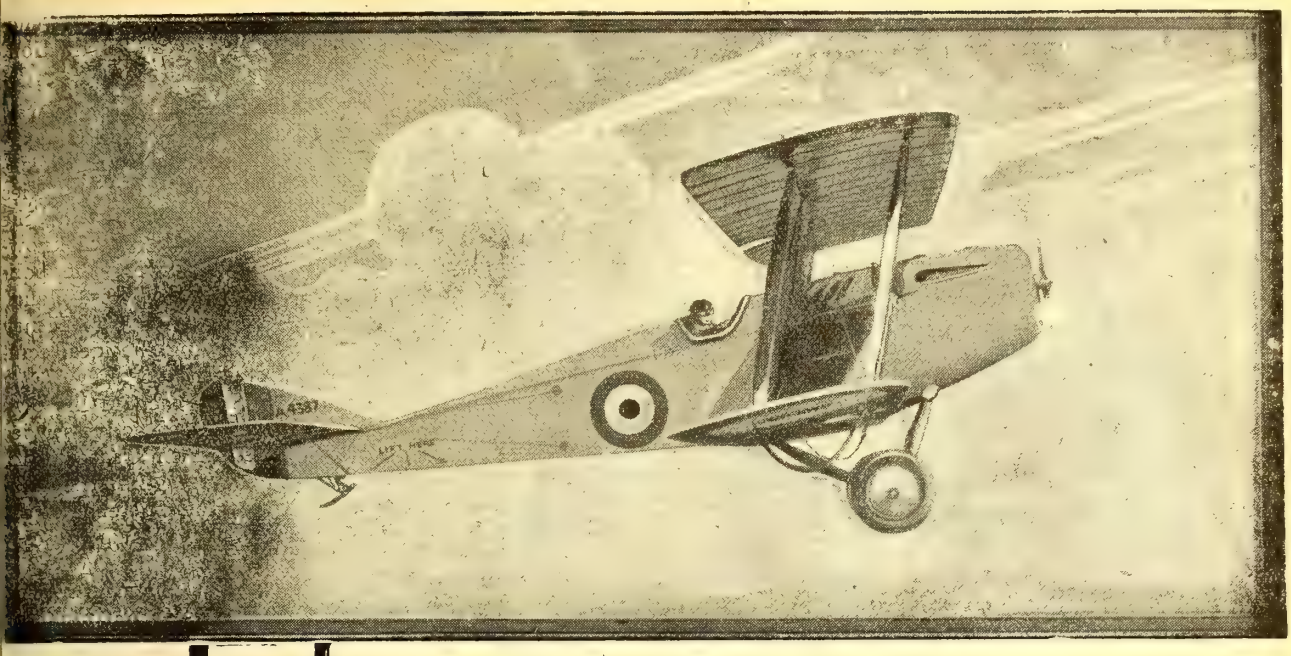
The appointment of Sir William Weir to be Secretary of State for the Air Force seems to be one of the few good actions to the credit of this Government. Sir William has proved himself to be a great producer of matériel. It has been made known publicly, though it has long been known to many, that under his driving force the output of aircraft has overtaken and surpassed the output of pilots and of the officers and men necessary to handle the machines on the ground.

Further increase in output would mean putting machines into store till they became obsolete. Even the heavy losses of aircraft and spares in the recent German advance have been more than made good from accumulated reserves. To have produced such a state of affairs is an achievement of which Sir William Weir may justly be proud.



At his particular job Sir William has made good. One may therefore hope that he will make good as Air Minister. He is determined without being headstrong, and he is cautious without being timid. He is not too big to work amicably with others who know their own particular jobs. On the other hand he is not weak and easily influenced either by bluff or by flattery.

He is said, by soldiers who have had intimate dealings with him, to have a remarkable grasp of the problems of war. One knows from his own actions and statements that, while as a producer he realises the value of standardisation, as a student of air war he realises equally well the importance of quick changes of types to meet the changing needs in the field. He himself said some six weeks ago that if we are to give pilots the best aeroplanes we must face constant changes and developments in the types of machines. That statement alone should win for him the confidence of the fighting men of the Royal Air Force.

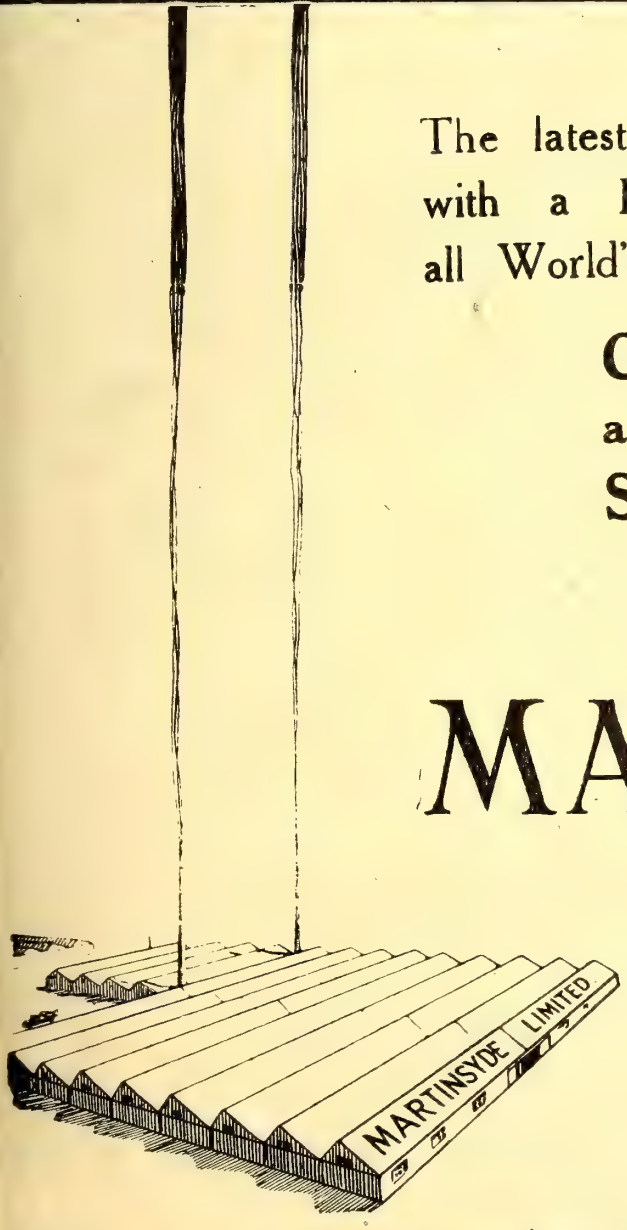


As an engineer who knows that if a man is to do his work well he must be allowed to do it in his own way he is not likely to try to interfere with the organisation of personnel or with operations arranged by the Service members of the Air Council, and if he proffers his opinion to them on their side of the air war that opinion will be well worth considering.

The Problem of Production.

One's only fear in the past, when Sir William Weir was suggested as Air Minister, was lest in obtaining a good Secretary of State we might lose a better Director General of Aircraft Production. Since then, however, Sir Henry Fowler has been appointed Deputy D.G.A.P., and has had time to prove his worth. In the nature of

Three-quarter Front View of a Gotha Grossflugzeug. This is, one believes, the first photograph of a complete Gotha to be published in this country.



The latest Martinsyde Fighter, fitted with a Rolls-Royce Engine, holds all World's Records for

CLIMB
and

MARTINSYDE

BROOKLANDS.
Head Office
WOKING, Surrey.

things he would automatically take Sir William Weir's place. In such an event there need be no fears on the score of aircraft production.

Sir Henry Fowler has won the good-will of everybody since he came to the Air Ministry. He knows good work when he sees it, and he knows a good man when he meets him. He is a practical engineer first, foremost, and all the time. When he is dealing with aircraft constructors he can talk to them as one who knows as much as they know themselves, and generally some more. And he has the priceless gift of being a man for whom other men are pleased to work.

He was chief mechanical engineer of the Midland Railway before he took to serving his country. Those who knew the Midland before the war know that in things mechanical it represented high-water mark among railways. Of all engineers the railway engineer seems always to be the most broad-minded and the quickest of perception, and of railway engineers the locomotive superintendent is the broadest and quickest mentally.

A British workman has said that there is no bad beer, but that some beer is better than others. Similarly one might say that there are no bad loco-supes; but that some loco-supes are better than others. Sir Henry Fowler strikes one as being the ideal loco-supe. If one wants a mechanical job well done, none can do it better than a railway engineer. Therefore one hopes to see Sir Henry Fowler take another step upwards on the path which he has followed with such conspicuous success since he became concerned with aircraft production.

A Proper Air Council.

One begins to have hopes that all may shortly be well with the Royal Air Force. If it were possible to combine in one Council the driving force and canny keenness of Sir William Weir, the great soldierly qualities and personal magnetism of General Trenchard, the organising cleverness of General Sykes, the naval knowledge and adaptability of Captain Groves, the political experience and worldly wisdom of Sir Henry Norman, and the engineering ability of Sir Henry Fowler, we should come very near having the ideal combination with which to conduct war in the air.

All are men of outstanding qualities, each in his own sphere of action. All know the needs of active-service aviators and the mechanical devices which are necessary to the execution of their duty. All recognise the vital importance of supreme Air Power to the existence of the British Empire. All are loyal subjects of His Majesty the King.

For each of them there is a place on the Air Council to which he is pre-eminently fitted. Is it too much to hope that if there are any little personal differences between any of them—and if there be such one is ignorant of the fact—they would hide away those differences for the time being and unite in helping this afflicted country to get along with the war?—C. G. G.

A SUGGESTION FOR THE WAR CABINET.

The official announcement that Major-General Sir Hugh Trenchard is not to sever his connection with the Royal Air Force will cause a feeling of intense relief to every officer and man in the Flying Services.

At the moment of writing his precise appointment is not announced. It is hardly likely that he will be created Commander-in-Chief, R.A.F. That would be too obviously the right thing for any Government to do for any likelihood to occur of its actually happening. It may be, however, that he will become C.-in-C. in effect, if not in name, with some such office as Inspector-General, or other equally comprehensive and non-committal title.

There is, nevertheless, a chance for the Government to do the really great thing if it has the moral courage and the necessary tact. It was suggested a week or so ago by M. Lasies, Deputy for the Seine, that an inter-Allied command for the Flying Services is desirable, such a command being analogous to the combined command of the Allied Armies on the ground. If such scheme were ever put into effect, one suggests that none could be more fit to command the Allied Air Forces in the field than General Trenchard. It is known that the admiration of the French aviators for him is little, if at all, less than that of the R.F.C. for its great leader. The French claim him as their own by virtue of his Norman ancestry. They would, one is assured, accept him as their aerial commander with enthusiasm, and would support him loyally in every respect. The Americans equally accept him as the great leader of men which the history of the war has proved him to be.

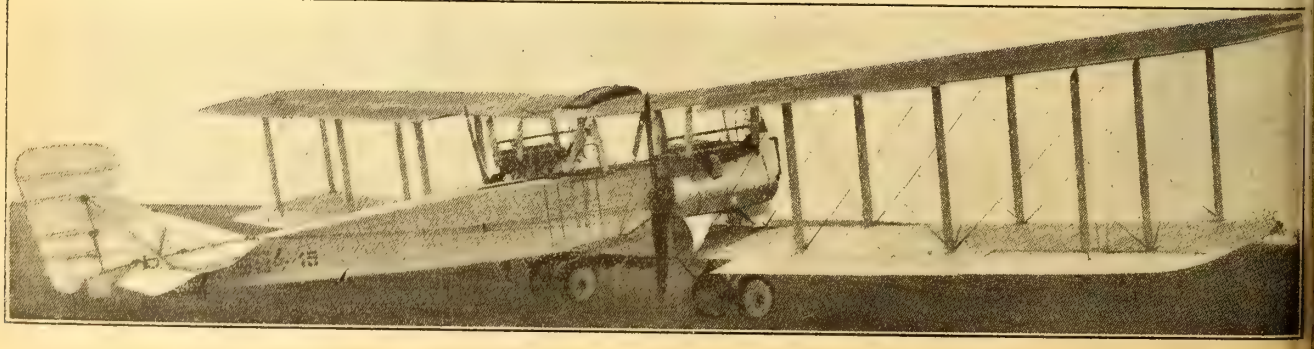
As C.-in-C. of the Allied Forces General Trenchard would have a job greater by far than that of Chief of Staff, R.A.F., or even C.-in-C., R.A.F. That such may be the outcome of the present upheavals will be the cordial wish of all who have served with him.—C. G. G.

THE NEW AIR MINISTER.

It is officially announced that the King has been pleased to approve the appointment of Sir William Weir to be Secretary of State for the Air Forces, in succession to Lord Rothermere.

THE LATEST RESIGNATION.

The Parliamentary correspondent of the "Daily Chronicle" writes on April 25th :—



Sir Arthur C. Roberts, K.B.E., a chartered accountant of high standing, has relinquished his appointment as expert financial adviser to the Air Ministry. He did excellent work in that capacity, and also earlier in the financial re-organisation of the Army Clothing Department, Pimlico. In both cases he gave his valuable services without remuneration.

His resignation from the Air Ministry is due to disagreement from Lord Rothermere's policy in regard to certain matters of administration.

CALLED TO THE BAR.

The following are among the names of those called to the Bar at the Inns of Court on April 24th :—

Middle Temple.—Sec. Lt. Sir C. C. Mansel, Bt., R.F.C.; Lt. H. S. Nichols, R.F.C.

Three-quarter Rear View of a Gotha Grossflugzeug.

SAUNDERS OF COWES

FOR nearly 90 years the firm of SAUNDERS has been established on the Thames and at Cowes, Isle of Wight. They have long been known as constructors of fast power boats, and are holders of all the world's records for speed.

¶ They are also pioneers in the design and construction of the *first successful Flying Boats in this Country*, which were taken over by the Navy *two years before the War*.

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTION SBAC

The Air Force Debate.

The debate in the House of Commons on April 29th was obviously of great interest to the Flying Services, in that it turned on the reasons for the removal of General Trenchard and his future connection with the Royal Air Force. The gallery and the seats for "strangers" on the floor of the House were full of officers of the R.A.F. and of others concerned for the good of the Services, and one could hear a distinct sigh of relief when Mr. George announced that the services of the great leader of the R.F.C. were not to be lost to the Air Force.

Uncomfortable Mr. George.

Mr. George refused to discuss the reasons for Sir Hugh Trenchard's resignation, and was obviously ill at ease in his efforts to shield Lord Rothermere. One can well understand his discomfort in view of all the circumstances. The House was distinctly hostile to him, despite all the good "party" men having been brought so well to heel, for there comes a time when even a politician feels that the welfare of the Services is more important than party.

The fact that Mr. Pringle's amendment, on which the discussion was based, was turned down by 127 votes to 37 does not in the least indicate the feeling of the House, it merely indicated that Mr. Lloyd George was let off with a caution in return for retaining Sir Hugh Trenchard's services, and for going back on Lord Rothermere's ill-advised actions. It was not surprising, therefore, that Mr. George's defence of the ex-Minister for the Air Force failed to convince anyone of their sincerity, for, as has been said elsewhere, Mr. George has a keen political sense, and he would have had to be preternaturally stupid not to gauge the feeling of the House in the first five minutes of the debate.

He worked off his ill-temper in an explosive but weak attack on Lord Hugh Cecil, who, in the course of a distinguished panegyric on General Trenchard made a reference to amateur strategists in the Cabinet which gave Mr. Lloyd George an excuse for his outburst. Lord Hugh Cecil's methods are too much those of a gentleman of the old school to permit him to deal with Mr. George as the occasion really demanded, and as the opportunity permitted.

Major Baird's Part.

In the ordinary course of events Major Baird (Under Secretary for the Air Force) should have introduced the Air Force Vote, in which case one might reasonably have expected an enlightening speech from Sir Henry Norman, the additional member of the Air Council, but, whether by sheer lack of intelligence or through malice aforethought, Major Baird chose to finish up the debate, thus blocking any possibility of Sir Henry Norman's speaking. Major Baird's effort was in his usual offensively jaunty manner and was full of his usual blatant inaccuracies, which, if not actually intended to deceive, have the effect of misleading the ignorant.

One of the most important changes yet to be accomplished in the Air Ministry is the removal of Major Baird and his replacement by someone, if such another can be found, of the quality of Mr. Ian MacPherson (late Under-Secretary for War), whose utterances and methods stamp him at once as a gentleman and a statesman, as distinguished from a genteel-man and a politician.

A Valediction.

One takes this opportunity of congratulating Mr. MacPherson on his well-deserved promotion to be Vice-President of the Army Council, and Deputy-Secretary of State for War, and of prophesying that, subject to his retaining his health and strength, he will in time become the leading statesman of this country. Men who are able, honest, or honourable are so scarce in political life that one who is all three at once stands out noticeably, and marks himself for future greatness.

Such is Mr. Ian MacPherson. It is greatly to be regretted that his capable brain is no longer concerned with the affairs of the R.F.C., for in all his dealings with the Corps, as Under-Secretary for War, he has displayed an intelligent appreciation of affairs and intense human sympathy. One only wishes that the Air Ministry could claim him for its own.

THE DEBATE.

Space and time are lacking in which to record the debate in full. Nor indeed would it be worth while to do so, for little was said which tended to advance progress. One gives, therefore, an abridged report taken in the main from the "Times" newspaper:—

The House having gone into Committee of Supply on the token vote of £1,000 for the expenses of the Air Ministry,

Mr. Pringle moved a reduction of the salary of the Minister. He believed he was expressing the feeling in all quarters of the House when he expressed deep sympathy with the late Secretary of State for the Air Ministry, who for reasons of ill-health and private sorrow had been compelled at this juncture to relinquish his post. But he thought that, in spite of Lord Rothermere's retirement, a discussion on the recent changes in the Air Ministry was necessary because, as they had been informed by the Leader of the House, the decision taken with regard to the late Chief of the Air Staff was not only the decision of the Secretary of State, who had retired, but the decision of the War Cabinet. Further, the House had been informed that the matter that issued in General Trenchard's resignation was a question of policy, and that being the case it was the right of the House to know what were the differences of policy between the Minister and his Chief of the Staff that ended in the resignation. Another strong reason for discussion was that the House was anxious that the best use should be made of the undoubted abilities of the late Chief of the Air Staff, whose resignation, announced without any explanation, had given rise to a great deal of unrest in the public mind as to the conduct of the Air Service, and had brought about what was of far greater importance, a condition of complete consternation throughout all ranks of the Air Force. A number of semi-official explanations had been offered in the usual way. It had been stated, by people who gave the impression that they knew or ought to know, that General Trenchard was not altogether the officer qualified for the post which up to a fortnight ago everybody believed that he filled admirably, and that he was not fitted to be the head of a thinking department, whatever that might mean.

The only approach to an explanation which had been given in this case was the statement of the Secretary of the Air Ministry, that the difference between the late Secretary of State and the late Chief of the Air Staff related to the views which they held as to the functions of the latter. It might be that the explanation was to be found in Lord Rothermere's recent letter to Lieutenant-Colonel Faber, in which he stated that he proposed to establish a strategetic council. Possibly that might be the "thinking department." Obviously all the duties relating to strategy and tactics had been entrusted to the Chief of the Air Staff,—and one would imagine that to be the most effective arrangement. Experience of war councils and strategic committees pointed to the advisability of concentrating responsibility in such matters upon a single individual. It could only be assumed that the War Cabinet accepted General Trenchard's resignation with the greatest reluctance and regret, and that they took their decision because they preferred to retain Lord Rothermere and allow General Trenchard to go. Now that a change had taken place in the occupant of the office of the Secretary of State the War Cabinet had an opportunity of changing its position in regard to General Trenchard.

Lieut.-Col. Sir H. Verney said that when he had put a question to the Chancellor of the Exchequer as to whether he was aware of the disgust in France at the dismissal of Sir H. Trenchard he replied that he was not. From Sir Douglas Haig downward the feeling in France was unanimously one approaching disgust with what had occurred. He was sure the Germans would say that the admitted superiority of the British Air Force was due to Major-General Trenchard. Of course, he could not prejudge the case. He did not know the facts, but he felt entitled to say that those who were actually serving in France held one opinion—that of disgust at the dismissal of General Trenchard. Unless some palpable and obvious reason was given for the dismissal, or unless they could be told that this gallant officer would either be reinstated or would be given work in which his unrivalled experience would find scope, he should vote with the hon. member against the Government.

Lord Hugh Cecil said that he had received from one or two friends words of counsel against speaking in that debate because of the circumstance that he was, a short time ago, occupied in a very subordinate position in the Air Ministry. As a matter of fact that would not have prevented his speaking, as it was not his desire to say anything controversial about anything that was past; but as his connection with the Air Ministry was at an end obviously his mouth was free. He was sure they all agreed that where the public interest was seriously concerned, and especially in war-time, no mere question of etiquette should stand in the way of a member doing public service. He held most strongly that the first duty of every member of that House was to his constituents.

They often thought of that House as a purely democratic body; but a member of Parliament also formed part of the great sovereign authority of the country, and any duty arising out of that most honourable membership must take precedence of everything else. Of course, personal honour came before any official duty even of the highest, and a member of Parliament was bound in honour not to make use of any information which came to him in any official relation; but to go beyond that would be seriously to diminish the usefulness of a member in debate, and especially to curtail criticism of the Government which could not be suffered to be weakened in any way whatever.

In regard to the resignation of Lord Rothermere, he desired to express his warmest sympathy and his deep regret for the tragic circumstances which had brought it about. But he could

not speak so respectfully of the Prime Minister's letter accepting the resignation. Perhaps the kindest thing to say of it was that it was the outcome of a strong Celtic imagination, for while it purported to be a statement of fact, it was rather an essay in hagiology.

There was now a new Air Minister, and he desired heartily to congratulate the Government on the appointment of Sir William Weir, a man in whom the strongest trust could be placed. But it was indisputable that the Air Service had suffered great losses in the resignations of Sir David Henderson, who had presided over it almost from its commencement, and General Trenchard, who had an extraordinary capacity for organisation and knowledge of detail. General Trenchard was also a great leader, and in that respect he was almost impossible to replace.

It seemed to be commonly supposed that by the mere multiplicity of aeroplanes the efficiency of the Air Force was increased. Nothing could be more untrue. The life and efficiency of the aeroplane lay in the flying pilot. It was because of the character of our aviators that we could say that our Flying Force was the greatest in the world. That was due partly to the fact that we had such splendid material to work upon, but also because the leaders of the corps always kept in view the improvement of the *moral* of the pilots. A young officer whom he chanced to meet casually the other day said to him that the Royal Air Force might become the finest Service of the country, or might become absolutely rotten and degraded. Leadership was in all military matters a thing of the highest concern. But it had never been so great in the Army or Navy as it was now in the Air Force, and because of the temperament of the men it was never so easy to destroy the *moral* of infantry or cavalry as it was to destroy the *moral* of the Air Force. It was in that respect that General Trenchard was an indispensable person. His knowledge of the temperament of the men was most profound and subtle. The *moral* of the force was of the first importance. It might be illustrated by the unfortunate expedition to the Dardanelles, the true error of which was not in supposing that an attack on the Dardanelles was not a wise thing to do, but in forcing it on their military and naval advisers against the grain. Nothing was more foolish than to try and impose strategical ideas on those who had to carry them out unless you could induce those persons to fall in with your ideas and carry them out as though they were their own. If they had a man like Sir H. Trenchard at the head of the Air Service, perhaps they might find that he would not always listen to the ideas of every amateur strategist in the Cabinet quite as sympathetically as that strategist in the Cabinet might desire.

Mr. George: Why does the noble lord say that? No amateur strategist in the War Cabinet has ever suggested anything of the kind to Sir H. Trenchard. The noble lord has no right to say that.

Lord H. Cecil: I am not suggesting that; I did not think that the Prime Minister was so very sensitive.

Mr. George: Sensitive, yes. There is so much talk of this nature going around. I cannot imagine any such suggestion coming from the War Cabinet to Sir H. Trenchard.

Lord H. Cecil: I am very glad to hear the right hon. gentleman say so; it entirely accords with my own impression. I will tell the right hon. gentleman quite frankly what was in my mind. What I have heard Sir H. Trenchard criticised for in conversation is that he will not accept new ideas if they are put before him. I believe that to be entirely untrue. All that was in my mind was that conceivably somebody had said something to him which he had not received respectively.

Mr. George: Not in the Cabinet.

Lord H. Cecil: I am very glad to hear it. Considering that the Prime Minister has lost a great public servant, I really think he need not show himself so very sensitive when we are pointing out how great the loss is. The right hon. gentleman really seems to care about nothing except his own retention in office personally. (Cries of "Withdraw" and "Get on with the war.") All and every public servant may resign office, and if anyone so much as discusses the subject the Prime Minister is angry and interrupts. I really do not know why the right hon. gentleman is angry if it be not for that reason.

Mr. George: The noble lord surely ought to know what I mean. He talks about the interference of amateur strategists in the Cabinet with Sr H. Trenchard. He has not the slightest ground for it, and instead of apologising, as he ought, he makes one of the most offensive suggestions that it is possible to make.

Lord H. Cecil: I used no such language. I am entirely within my rights. Everything I said was right and proper, and I certainly am not going to withdraw a syllable. If the right hon. gentleman supposes that he is going to browbeat critics in this House he ill understands the House of which he is a member, or the particular member who is now addressing the Assembly.

The noble lord, in conclusion, earnestly begged the Government to consider that they had lost a great national asset, and implored them to retrace their steps in the name of our common patriotism and common country.

The Prime Minister's Reply.

Mr. George: I am very anxious in the present state of public affairs, especially military affairs, to avoid anything in the nature of unnecessary disputation, and I am especially anxious to do so when we come to discuss a force like the Air Force and the internal administraton of this Force, and I shall endeavour, if possible, to avoid anything in the nature of personal recrimination or dispute. So far as I am concerned, I shall certainly do nothing to add to the temperature. I have this afternoon listened to the criticism of the action of the Government, criticism which has been advertised in advance, and I listened to the speech first of all of my hon. and learned friend the member for North-West Lanark (Mr. Pringle), and I confess that after listening most carefully I really do not quite know what he was driving at.

I now come to the speech of the noble lord (Lord H. Cecil) and with regard to most of it let me say at once I agree. Certainly I agree with every word he said about the great, the distinguished, and the remarkable service rendered by Sir Hugh Trenchard to the country. There is not a word of that which the Government does not adopt. There is one proposition, however, he laid down which I certainly do not accept. I am referring to his claim that members of Parliament serving in the various branches of the Army have a different standard of discipline to others who are not members of Parliament. What is the position with regard to that? It is, I think, very derogatory to the whole discipline of the Army.

The Army Council called my attention to the fact that there were several members of Parliament who were serving in the Army and who were utilizing knowledge which they got as officers in the Army in order to criticise Army administration in this House, and they said: This is extremely unfair to the Higher Command, it is extremely unfair to those who have the direction of the Army, and these members ought to decide between being members of Parliament and being officers.

Commander Bellairs: Will my right hon. friend be specific on this point? Does he claim that members of Parliament who belong to the Army and Navy are not free to criticise in this House?

Mr. Harcourt: The right hon. gentleman said there was no the same standard of discipline from serving officers who are members of Parliament. I made it my business to ascertain whether that was so, and I was told the standard of discipline was the same.

Mr. Billing: May I ask the right hon. gentleman whether having regard to the opinions expressed, he will take steps as the head of the Government to see that this does not occur again?

Mr. George: I do not say that I can state in clear, precise, technical language the exact limit, but what I mean is that an officer actually serving, whether in the trenches or elsewhere ought not to use information he gets in that capacity for the purpose of criticising the Command, whether it is civilian or military, or for the purpose of praising it. It comes to the same thing.

Lord H. Cecil: The right hon. gentleman would not get intelligent criticism at all.

Mr. Lloyd George: What it really means is that a member of Parliament has to choose. You cannot administer any Department, military, naval, or civilian, without some difference of opinion between the experts and the civilians; they always arise. The civilian is there to put the civilian point of view; the expert is there to give expert advice. Differences must arise especially if you have got men of strong individuality on both sides, and the only way to settle them is that there shall be no undue political interference on either side. I am certain many disputes would have been settled if they had been left alone in that respect.

Sir E. Carson: Is it not a fact that the civilian is always the judge?

Mr. George: He is the head of the Department. That is the British Constitution—that the civilian has been put there as a judge. It is even a principle of the law that the juryman who is inexpert is the man who sits in judgment upon even the Judge. He has got the final say in the matter; he is an inexpert who has the final say.

Now I come to deal with the general, I will not say criticisms but general observations which have been made. I again repeat that the Government agree with everything that has fallen from either of the two hon. members about the services of General Trenchard. I do not accept the statement made by the hon. member, who comes here to speak on behalf of those who served in France, that General Trenchard has been dismissed. He insisted upon using those words. General Trenchard resigned. If the War Cabinet or his Minister had suddenly dismissed him that would have been a very different set of circumstances. General Trenchard put in his resignation for reasons which I do not want to enter into, because it involves a dispute which the noble lord himself has not thought fit to enter into, as I think, wisely. I do not think anything would be gained by entering into these controversies inside the Air Board.

ROLLS-ROYCE

The Cabinet asked General Smuts to finally look into the matter. General Smuts has rendered very great services indeed to the Air Force in the course of the last two months. There is no one who doubts his tact, his sagacity, and his knowledge of war. Acting upon the investigations which he made, and without expressing any opinion upon the merits of the dispute between the civilian heads of the Department and the Chief of the Staff, he certainly came to the conclusion that General Trenchard's special qualities were not used to the best advantage in his position as Chief of the Air Staff.

If the Committee listened, as I know they did, very carefully to the description given by the noble lord of General Trenchard, it was the description of a great leader. He said something about Nelson and Wellington. I am not sure that either of them could have been the Chief of the Air Staff. That is not a criticism of Nelson. That is not his quality, and I agree with the noble lord that the qualities of General Trenchard are qualities of the Nelson type—his highest qualities are Nelsonian qualities of mind and inspiration. I do not know to what extent Nelson had great qualities of organisation. He must have had them to a considerable degree, but, at any rate, they are the qualities of a great leader of forces.

I can assure the noble lord that there is an essential difference between the kind of qualities which you require for a man who sits in an office to think out carefully, slowly, perhaps laboriously, plans not merely for to-morrow, not for the day after to-morrow, but for next year—because that is the business of the Chief of the Staff of the Air Board, to think out the work of the Department for months to come, for this year and for next year—that there is a vast difference between the qualities required for that and the qualities you require for great leadership and inspiration of the Air Force.

Having been faced with the accomplished fact of the resignation of General Trenchard, having to consider as between General Trenchard and General Sykes for the position of Chief of the Air Staff, there was absolutely no doubt in the minds of those who investigated the matter on behalf of the Cabinet that for that particular post General Sykes's qualities and mind were better adapted than those of General Trenchard. That is not a criticism of General Trenchard, or it would have been a criticism of the Duke of Wellington or Nelson to say that they were not fitted for Chiefs of the Staff, but that they were very great leaders.

That was the position with which we were confronted, and I have no doubt at all that after looking into the matter, and after hearing what has been said on the subject, not merely by General Smuts, but by the presiding head of the Air Force, of the Air Services, that the Cabinet came to the right conclusion.

Sir William Weir's Work.

The noble lord spoke in the highest possible terms of Sir William Weir. He is quite right. General Trenchard has rendered services to the Air Force which are incalculable, and so has Sir William Weir, and the services which he has rendered are not merely the services of a manufacturer who increases the supply. No one knows better than the noble lord that Sir William Weir has made a special study of the Air Force. He has been thinking out the best methods of using that great Service, and a good deal of the efficiency of the Force at the present moment is due to the fact that Sir William Weir went outside his special functions of manufacture and thought out in advance the kind of thing that could be done by means of aeroplanes—things which were not thought of at the moment by any other expert. There are machines of a type used for particular purposes now which are there because Sir William Weir thought of them in advance, a year ago.

Having a great knowledge of the air, and feeling that a good deal could be done outside the limits which had then been laid down for aerial activity, Sir William Weir planned machines, and now there is not a general in the Air Force who would not admit that a very large measure of the efficiency of the Force is attributable entirely to the fact that Sir William Weir showed foresight which was beyond that shown by any other member of the Air Board.

When you come to consider whether it is desirable to turn out the present Chief of the Staff of the Air Board and to put General Trenchard in that post instead of using his services where they can be of more advantage to the Air Force, then the opinion of Sir William Weir must necessarily count with the Government. He has absolutely no doubt upon the subject—none. That is not the best way of using the great services of General Trenchard, and there is no man with greater admiration for General Trenchard than Sir William Weir. The noble lord and the right hon. and learned gentleman know perfectly well that Sir William Weir and General Trenchard got on without any difference of opinion or any dispute. Nothing could be better than the co-operation between those two men.

There has been no difficulty so far as Sir William Weir is concerned, but it was his definite and deliberate opinion that for the particular kind of work which you want a Chief of Staff to do General Sykes is better adapted; but he also believes that General Trenchard's services ought to be retained in the Air Force.

General Trenchard to Remain in the Air Force.

I am very glad to be able to say that there is every hope that General Trenchard's services will be retained in a position of considerable power in the Air Service. As a matter of fact two or three positions were offered to him in the Air Service, but for reasons which were quite honourable to him he refused them. I need not go into those reasons, but I may state that he felt that he might be displacing someone or other, and a man of the honourable nature of General Trenchard did not wish to be placed in a position not a little embarrassing and distressing to himself. Sir William Weir is confident, now that General Trenchard's services are to be retained in the Air Force, that he will not be placed in the position where there is not scope for his varied powers to be exercised in the future.

Mr. George then proceeded to eulogise Lord Rothermere and thereafter continued:

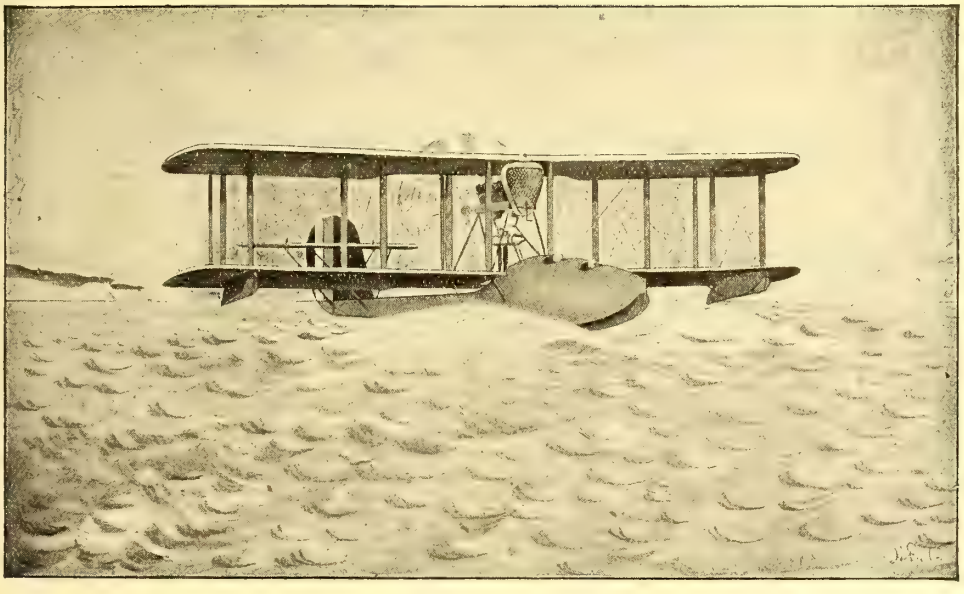
I am perfectly certain that the House and the country will be anxious to give Sir William Weir every opportunity to do his best to increase the efficiency of the Force, especially at a time when there is such a great strain upon it. Everything should be done that can be done to avoid friction, differences, and disputes, and I do not think there will be any perpetuation of this controversy in the Air Force itself. I do not conjecture, I know, that General Trenchard is the last man in the world to desire that. He is willing and anxious to co-operate with the present head of the Air Force, and I trust that the House, without entering into disputes which are thoroughly unprofitable, will now allow the new Air Minister the opportunity of developing on a greater scale, with the assistance of an extremely able Chief of Staff and the co-operation of General Trenchard in order to enable the Air Force to render in future even more brilliant service than they have done in the past.

Mr. Asquith's Views.

Mr. Asquith: There are two points which I think all the House will have heard with much satisfaction, or at least with considerable sympathy. The first is the welcome intelligence that the unrivalled services, for such they are, of General Trenchard in the Air Service are to be retained in that Force. We should be glad to know what particular functions have been assigned to him. It is not enough that he is not to take one of the offices which he has chivalrously refused to take on the ground that he might supersede others; what we would like to know is whether he is to be put in a position where he will have scope for his unexampled powers of organisation and leadership. The second point in my right hon. friend's speech which I think was generally acquiesced in by the House was his expression of heartfelt sympathy with the personal disabilities that have fallen upon Lord Rothermere, and, next, his equally heartfelt recognition of the eminent qualifications of his successor for the post to which he has been appointed.

Now, to say a word or two about the particular subject of this discussion. Let me say at once, lest I should fall under suspicion, that I have not, and I regret it very much, the honour of the personal acquaintance of General Trenchard, but I know a great deal about him. I have followed the history of the Air Service from its cradle onwards, and in those infantile days, long before the war, we owed an enormous deal to men whose services in that respect are now hardly remembered, particularly my right hon. and gallant friend now fighting at the front who was then Secretary of State for War (Brigadier-General Seely), and I will very gladly add General Sykes, who has now been appointed Chief of the General Staff of the Air Force, and, when I was Secretary of State for War, some time before war broke out, I was brought into full cognisance of his great expert knowledge in these matters. But there is not a man in this country to whom the Air Force is under such a debt of obligation as to Sir Hugh Trenchard.

When people talk with that superficial and often colossal ignorance to which we are accustomed in certain of our critics, when they speak of General Trenchard as a man deficient in powers of organisation, they are talking what every one who knows anything of the Air Force or of General Trenchard knows to be absolute nonsense. I have seen a great deal of organisation—military, naval, and civilian—and I say without hesitation I have never come across a finer organiser than Sir Hugh Trenchard. He was appointed, and I think wisely appointed, Chief of the Staff. That appointment was not made, I presume, without full consideration of the claims and qualifications of possible competitors. Without a dissentient voice so far as I know in the Army, Navy, or Air Service itself, he was nominated to that post. We do not know now how it was that it was discovered that his special qualifications were not particularly fitted for what seemed to be, in the opinion of some authorities, at any rate, the very mysterious and nebulous function of Chief of the Staff.



My right hon. friend has suggested that Nelson would not be a good Chief of the Staff, or Wellington. Perhaps he might have said Napoleon. I do not know what his conception of the definition of Chief of Staff really is, but I would have said that there was nobody in the Air Service who had the same eminent

claims to that post as Sir Hugh Trenchard Something has happened which still remains undisclosed, something has happened which convinced—who? Convinced Lord Rothermere that whatever other qualifications General Trenchard might possess he was not the right man to be Chief of the Staff. It appears from an answer given to a question on April 24th that no member of the War Cabinet had seen General Trenchard in regard to the matter. We must assume that to be true.

My right hon. friend I rather gathered said it was referred to General Smuts in the first instance. General Smuts is a member of the War Cabinet, and a denial therefore that General Trenchard was seen by any member of the War Cabinet must apply to General Smuts as well as to the rest. That General Trenchard's resignation was accepted by the War Cabinet without any communication with General Trenchard himself is, I think, a regrettable proceeding, particularly as we are still in ignorance of the points of difference between General Trenchard and his superior officer.

I should have gone a good deal further in the way of criticism if, as was commonly reported, the result of this incident was going to be that the Air Service was to be deprived during the remainder of the war of General Trenchard's counsel and action in the particular department in which he was admittedly without a superior. It is a consolation, if not more than a consolation, to the House and the country to know that, at any rate, that calamity has been averted, and that in some capacity—I hope a capacity adequate to General Trenchard's abilities, and, above all, his unrivalled authority in the great Service he has done so much to build up at the War Office—we may still count on General Trenchard as an effective fighting factor in this terrible crisis of our history. But I should not be speaking my full mind, or be candid with the House, if I did not say that I regard this as a regrettable incident, and one which I wish the Government could have avoided.

The Carson Touch.

Sir E. Carson said he did not profess to know a great deal about the Air Service, nor did he feel very enlightened after the speeches which had been made as to what was the reason why General Trenchard was driven out of his appointment. He knew a distinction was drawn between resignation and dismissal, but the line was very narrow He knew this much—that a great, fierce, courageous, patriotic soldier like Sir Hugh Trenchard would never have chucked his job when a great battle approached unless he felt himself driven to it.

He did not think in all his long experience in the House he had ever known a case which had created such universal anxiety in a Service as the retirement of Sir Hugh Trenchard had in the Air Service. He knew very few of the officers of the Air Force, but he had heard in the past week or ten days a good many of them talk upon this subject—he did not suppose the Prime Minister objected to officers talking to members of Parliament—and one and all, men he had never seen before, told him the same thing, that the soul had gone out of the Air Service when Sir Hugh Trenchard had gone.

What did that mean? This was not an old Service with a large reserve of living officers. It was a young Service which could not appeal to its Nelsons, its Wellingtons, or anybody else; it was a Service almost made by Sir Hugh Trenchard—a Service in which youth, nerve, courage, trust were everything; and from what those officers told him he believed the whole of our superiority in these qualities were derived in the main from the great confidence they had in Sir Hugh Trenchard being at the head of the Air Service as Chief of Staff.

It was certainly some consolation to know that Sir Hugh Trenchard was to be retained in the Air Service, and they were grateful to the Government for it. But they would like to know what was the position General Trenchard was to have. It was now four or five months since, after the announcement of the dismissal of Sir John Jellicoe it was stated that means would shortly be taken to make use of his great ability to the Service; but the last that was heard about him was that he was hanging pictures in his private house.

What did the Government contemplate in regard to General Trenchard? It could not be some petty position. The public must be assured that the appointment was a reality, in which General Trenchard would visualise, as he had done in the past, the whole Service over which he so ably presided.

He greatly regretted that Lord Rothermere, for reasons with which they all sympathised, had to retire from his great post, and as this retirement of Sir Hugh Trenchard happened merely through disagreement with Lord Rothermere, it really would seem to be common sense that, as Lord Rothermere had gone and was no longer there to disagree with General Trenchard, the man who was so essential up to the day of sending in his resignation might again be equally essential without any friction whatever.

Our Comic Constitution.

He thought it was well that the public should know, when these dismissals arise from time to time, how exactly in our Constitution the case stood; because let this be remembered and thought about, that when a dispute arose between the civil head of a great Department of the State and his great expert, in that dispute the civil head was the judge.

If a man went to the Admiralty as First Lord and had been there only a week or a fortnight, he could dismiss at his own will his expert advisers. The public, therefore, should know that when it came to be a question whether an indispensable expert adviser or an ignorant civilian, who had only been there a fortnight, was to go, the decision rested with the civilian.

That was the constitutional position. It was a very serious one, and he thought that when those things happened it was, at least, the duty of the Government thoroughly to investigate in a case of the kind what has been the real cause of the State, in its throes, as it was at the present moment, losing a great and an efficient soldier.

The Employment of General Trenchard.

Mr. George: In response to the appeal from my two right hon. friends, perhaps I had better read the very words in which the new head of the Air Ministry refers to the employment of General Trenchard: "He is not prepared to allow the Air Force to lose the great qualities and unique experience of General Trenchard, and proposes to offer him a position in which those qualities and experience will find an outlet of the greatest value to the Force. He asks that the House will not press for a definition of the position at the present time, and asks me to say that it is not proposed to create one, but to give him one directly associated with his own aerial policy."

Sir J. Simon said that having had close, personal, daily knowledge of the young men in the various squadrons in France, he thought it no exaggeration to say that the news of General Trenchard's resignation had struck those young men as an almost deadly blow. They wholly failed to understand it. If they wanted those young men to laugh they had only to try to make them believe that Sir H. Trenchard did not understand staff work.

They all knew the work he had done. Nor could it be gainsaid that there was not a single development of aircraft at the front in which you could not trace the active imagination and organisation of this distinguished soldier. Low flying, which did so much in the battle of Cambrai, and which saved the British Army was anticipated and worked out and organised by General Trenchard in the last year or two. The same was true of photographic reconnaissances and bombing of all sorts to which machines were being put, and it was the height of absurdity to speak of him as a person who had merely the qualities of leadership.

He had never heard in any quarter at any time from any Army officer of any rank any other verdict than that the manner in which the general had practically adjusted the differences between the two branches of the Service had won the admiration of every one of them.

When General Trenchard left the command in France to come over here at Lord Rothermere's own invitation in order to accept the post Lord Rothermere assigned to him, he wrote a letter to the French Flying Corps, and the distinguished general in command of that corps made the letter an order of the day. There was not an American in the Flying Corps who would not tell them that in organisation and in tact General Trenchard exhibited his great qualities.

What had made the real gravity of the situation was that when the British line was being driven back they were putting a strain on the squadrons of the Flying Corps which no one who had not seen it could properly describe. Airmen were giving up their aerodromes, they might have to burn their stores, they were flying all day and possibly coming back at night, and having to take their machines down in an open field. In these circumstances they depended on that steady confidence which only came from being sure that they were being wisely led by the man in whom they were placing their trust. Surely it was a terrible disaster that in the middle of this great battle such a distinguished soldier felt it his duty to offer his resignation.

[As a matter of fact, General Trenchard tendered his resignation before the battle began. He did his work during the battle. And he was turned out *by the Cabinet* at the most critical moment.—Ed.]

Mr. Joynson-Hicks said he was in a position to know the feeling of young men in the Air Service at the front and everything that had been said with regard to the absolute disaster of General Trenchard's resignation was correct. The enthusiasm of these young men had been inspired by General Trenchard and their devotion and willingness to die were the result of his teaching and training. In fairness it must be said that General Salmond, who had succeeded General Trenchard at the head of the Force in France, was a magnificent officer. If a new position were offered to General Trenchard which afforded him scope for his unrivalled talent, he was certain that in the interests of the country General Trenchard would forgive all that was past and accept the post.

He felt General Trenchard must be saved for the Flying Corps. If General Trenchard was not to be Chief of the General Staff he knew of no better man than General Sykes to fill that post. He suggested that the training of the Air Service here needed a strong hand, and that the Government could not do better than to hand over the management of the young pilots to General

Trenchard, who would instil into them the spirit of high devotion to duty.

Colonel McCalmont endorsed the suggestion that General Trenchard might be made responsible for the discipline, training, and recreation of young pilots.

[A perfectly futile suggestion. Sir Hugh Trenchard is a great soldier, not a schoolmaster.—Ed.]

Mr. Harcourt did not think the Prime Minister had made it clear that General Trenchard's successor was appointed not on a general consideration of the case as between two officers, but as being the best officer available after General Trenchard had resigned.

Brig.-Gen. Page Croft said that the Prime Minister had said that General Trenchard, for reasons of chivalry, did not wish to displace another officer. That point ought not to weigh with the Government. If Sir H. Trenchard were the best man for the position, no question of etiquette or chivalry should prevent the Government reinstating him in his former office, even though they admitted the splendid qualities of his successor.

Sir W. Essex asked why it was, when the Air Force was formed, that Sir W. Weir was passed over, first for one and then for another, and that other a journalist and a member of a family that, some of them thought, had had too much influence in the government of this country. He asked how many resignations from the Air Force had been offered within the last six months, and did the list include the name of the Parliamentary Secretary of the Ministry himself?

Mr. Billing said that if the debate did no more than make the position of a member of Parliament on any Staff or in any regiment impossible it would have accomplished much. The solution of the difficulty lay in the placing of General Trenchard in supreme command of the military side of the Air Service in France. He was exceedingly sorry for the resignation of Lord Rothermere who had made the strongest effort to knock the non-military side of the Service into some sort of proper condition. The Hotel Cecil contained many able men, but it was crammed full of useless officers doing absolutely useless work.

Major Baird (Parliamentary Secretary to the Air Board): That is a calumny on a great many officers who are doing absolutely indispensable work.

[Such as Major Baird?—Ed.]

Major Baird said the House would appreciate a letter which General Salmond, the officer in command, wrote to General Trenchard on April 6th, that was after the German offensive had been continuing for about a fortnight. General Salmond wrote:—"I wish you would express to the President and members of the Air Council and all concerned my thanks, and those of all serving with me, for the wonderful promptness with which all our heavy demands have been met to the full. It has helped us to keep going on, and the knowledge that we are so strongly backed from home gives us the utmost confidence in the future."

He hoped that would dispel from the minds of hon. members the ideas which the hon. member for Hertford had suggested. Anything more scandalous than that a man who had no knowledge of what he was talking about should accuse hard-working and efficient officers and officials of laziness and idleness when such testimony was paid to their work he could not conceive, and was to his mind a disgraceful thing for a member of this House to do. He was glad to have the opportunity of giving him the lie direct.

Sir W. Essex: Is the hon. member entitled to give the lie direct? Is that a Parliamentary expression?

The Chairman: It is not the Parliamentary way of expressing the hon. and gallant member's opinion.

Major Baird: If I used an unparliamentary expression I meant that what the hon. member said was completely and wholly inacurate. This work, he continued, had been carried out by the officers and officials of the Royal Flying Corps and the Royal Naval Air Service at the time they were amalgamating the two Forces, so that not only had they been able to meet all demands—and tremendous they were—that had been sent from the front, but they had been able to carry out the amalgamation of the two Services with the minimum of error.

There was an interesting figure showing in the most conclusive manner the growth in our superiority over the enemy in the air. Our losses in the air during March—that was, killed, wounded, missing, and prisoners—were almost the same as the losses we suffered in the air from all causes in April of last year. In April last year we were engaged in winning supremacy in the air in the battle o fthe Somme; in March, this year, we were engaged in the present tremendous battle, and, whereas our losses from all causes were practically the same in both months, the number of German machines distinctly ascertained to be destroyed—that was, seen to crash—were three and a half times as many this year as last.

Though everything was not perfect, he believed the Air Force was progressing upon sound lines and had complete and absolute confidence in its Secretary of State. The Secretary of State had asked him to say that he hoped, as soon as he had got into the saddle, that hon. members would give him an opportunity of meeting them in one of the committee-rooms upstairs, when he would be able to explain his position and policy as clearly as if he were a member of the House.

The vote was then agreed to, and other votes relating to the Air Force were afterwards agreed to without discussion.

R.A.F. AFFAIRS IN THE HOUSE.

On April 24th **Major Sir John Simon** (Walthamstow, L.), asked the Prime Minister on what date Major-General Sir Hugh Trenchard tendered his resignation, and on what date the matter came before the War Cabinet and the resignation was accepted.

Brigadier-General McCalmont (Antrim, E., U.): Before the right hon. gentleman replies, will he say whether it has not always been the custom for hon. members who hold commissions to refrain from making use of confidential information which reaches them in the course of their duties in putting questions or in taking part in debates which affect the conduct of their superiors, and whether he expects the practice to be continued in view of the questions on the paper?

The Chancellor of the Exchequer (Mr. Bonar Law) (Bootle, U.)—That raises a very large question on which I do not think I should be asked to give a decision now. In the meantime, I think it must be left to the good sense and good feeling of the members in question. Sir Hugh Trenchard tendered his resignation on March 19th to the Secretary of State for the Royal Air Force, who on April 10th and 12th brought the matter before the War Cabinet. The Secretary of State intimated on April 12th to Major-General Sir Hugh Trenchard that he had accepted his resignation.

Sir E. Carson (Dublin University, U.), asked whether the Secretary of State had power to accept the resignation without going to the War Cabinet.

The Chancellor of the Exchequer: Certainly.

Major Sir John Simon asked whether, between the date when General Trenchard's resignation was tendered and the date when it was accepted, the War Cabinet or any member of it ever saw General Trenchard on the subject and discussed with him the difficulties of his position.

The Chancellor of the Exchequer: The answer is in the negative.

Major Baird, Parliamentary Secretary to the Air Board (Rugby, U.), replying to **Sir F. Blake** (Berwick, L.), said that after tendering his resignation Major-General Sir H. Trenchard continued his work temporarily upon being requested to do so. As to whether he was consulted before the fact of his resignation was made public, the answer was in the negative.

On April 25th **Sir E. Carson** asked whether it was true that the Secretary of State for the Air Service had resigned, and whether any successor had been appointed.

The Chancellor of the Exchequer: It is true, I regret to say that Lord Rothermere has resigned, and his successor has not yet been appointed.

Mr. Pringle: Has Lord Northcliffe resigned his post on the American Mission and the Ministry of Information? (Laughter.

The Chancellor of the Exchequer: I have received no information to that effect, and have no reason to anticipate it.

Mr. Hogge: Is there any later news about Lord Beaverbrook? (Laughter.)

Lieut. the Lord H. Cecil: Will it be a convenient course to discuss the Air Service Vote while there is no Secretary of State in office, or would it not be more convenient to put the discussion off?

The Chancellor of the Exchequer: That must be a question to be decided by those who desire to discuss it, and not for the Government. If my noble friend wishes to postpone it the Government is quite willing.

Mr. Pringle: Is not this a decision of the War Cabinet? Must not we consider the position of General Trenchard?

The Chancellor of the Exchequer: The hon. gentleman speaks as if we were desiring to postpone the discussion, but we desire nothing of the kind.

THE ENLISTMENT OF R.A.F. CADETS.

The Secretary of the Air Ministry states that complaints have been made that R.A.F. cadets from various districts are obliged to travel to London for medical examination. Arrangements have now been made for the examination of all candidates at the centre in Arkwright Road, Hampstead, before they are drafted to cadet wings or schools of aeronautics.

A depot has been established at Hampstead to which all candidates are sent for their medical examination and subsequent attestation,, vaccination, and so on. The medical examination will be carried out, as before, by the Aviation Candidates Medical Board, which consists largely of experienced and expert medical officers, and has been enlarged and strengthened to meet the needs of the service. No candidate will in future be sent to a cadet wing or training school until he has been examined by this board and pronounced fit for aviation.

AIR MINISTRY REPORTS.

The Air Ministry issued on April 27th the following comparative statement of the number of bombs dropped by British aircraft in France over the enemy's lines opposite our front and of those dropped by the enemy in the area occupied by British troops during March :—

	British.		Enemy.
(1) By Day	23,099	.....	517
(2) By Night	13,080	.....	1,948
Total	36,179	.....	2,465

TRANSFER TO THE AIR FORCE.

An Army Council instruction has been issued dealing with the procedure with regard to officers and ex-officers who desire to transfer to the Royal Air Force as flying officers.

An officer serving with a unit at home who wishes to transfer will apply personally and with the written consent of his commanding officer to the nearest R.A.F. Reception Depôt.

An officer serving with an Expeditionary Force in Europe will apply through his commanding officer.

An officer serving in the Middle East or India will be entirely dealt with in Egypt or India.

An officer who is at home but not on the strength of a unit at home or abroad will apply in the first instance to the Officer Commanding London Reception Depôt, R.A.F., 40, Upper Brook Street, W., and will not require a letter from a commanding officer.

An officer who is at home but whose unit is abroad may, if he can produce the written consent of his commanding officer, apply in a similar manner.

THE ATTACK ON THE BELGIAN COAST.

Though aircraft were not apparently used in the attack on Ostend and Zeebrugge on April 23rd, there have been several references to the effect or non-effect of air work in the various reports. The following appears to cover the situation :—

The official announcement in Parliament says :—"At Ostend the two block ships were run ashore and abandoned after being blown up. It is too early yet to say definitely whether they have accomplished their objective or not. It was too misty for aerial observation, but reports from officers concerned are to the effect that, so far as they could see in the dark, they were slightly off their course."

The "Daily Express" understands that the officer who developed the scheme for the use of fog and smoke in connection with the attack was Acting-Wing Commander Frank A. Brock, O.B.E., R.N. Sir Eric Geddes stated that he was killed.

Sir Eric Geddes, in his announcement in the House of Commons, said that one of the objectives of the raid was the large seaplane base on the Mole of Zeebrugge.

The following extracts are taken from an account of the raid on Zeebrugge, which appeared in the "Times" on April 26th.

Photographs taken by our flying men show that two of the block ships are in the mouth of the Bruges Canal, well inside the shore line, and lying diagonally across the channel. The third is outside the canal mouth, blocking the greater part of the channel across the harbour.

As already announced by the Admiralty photographs reveal a clean break in the viaduct at the landward end of the Mole. They also show, I learn, that the Germans have tried to bridge the gap by planking.

AMERICAN AIRCRAFT PRODUCTION.

A message from Washington, dated April 24th, states that Mr John D. Ryan, the copper magnate, has been appointed Director of Aircraft Production under the scheme of reorganisation recently announced. An Aeronautics Division has been created under Brigadier-General William Kenly Yeading.

The Aircraft Board remains in an advisory capacity with Mr. Ryan as Chairman, in succession to Mr. Howard Coffin, who resigned.

The "Times" correspondent writes on April 25th from Washington that Mr. John D. Ryan, of Montana, who has been appointed Director of Aircraft Production will have powers and responsibilities similar to those conferred upon Mr. Schwab in regard to shipping. Mr. Ryan, who was born in Ireland, is a self-made man, and stands second only to Mr. James J. Hill among the men who have made the great North-West what it is to-day. He is pre-eminent as an industrial organiser, and was once described as a man who had "foresight, hindsight, and carsight."

General Squier, it is officially announced, will devote his attention to signals—in other words, will look after field telegraphs, telephones, and wireless stations. A division of military aeronautics is created for training pilots.

Under the new system, once the Army experts have decided on the types and quantities of aeroplanes they need, they will place their orders with Mr. Ryan, who will produce the machines. The Navy aircraft programme is not affected by Mr. Ryan's appointment, as the Navy is now ahead of schedule in the manufacture of seaplanes with Liberty engines which are said to be giving most excellent results.

THE DEATH OF MANFRED von RICHTHOFEN

It is now possible to give some particulars concerning the death of Rittmeister Freiherr Manfred von Richthofen, whose death was recorded last week.

The following obituary notice has been issued by the Commanding General of the German Air Forces, General von Höppner :—

"Rittmeister Freiherr von Richthofen has not returned from pursuit of the enemy. He has fallen. The army has lost its generally admired hero, the Chasers their irresistible and beloved leader. He remains the hero of the German people, for whom he fought and died. His death is a deep wound for his squadron and for the entire Flying Service. The will by which he conquered and led, and which he handed down, will heal the wound."

It appears that on the morning of his death the following order was transmitted by the Group Commander of Aviation concerned to the "First Pursuit Squadron," which Capt. von Richthofen commanded :—

"It is not possible to fly over the Ancre in a westerly direction on account of strong enemy opposition. I request that the aerial barrage be forced back in order that a reconnaissance up to the line Marieux-Puchevillers (10 miles behind the front) may be carried out."

As a result the squadron appeared over the British lines between the Ancre and the Somme, not far from Corbie, at about 11 a.m. on April 21st, and attacked two British aeroplanes, said to have been manned by Australians. Various British aeroplanes flew to their rescue, and what is known as a "dog-fight," or general mix-up engagement, ensued.

Von Richthofen headed a British machine out of the fight, and was pursued in turn by another British aeroplane.

The trio worked about two miles away from the general engagement, descending steeply until they were within a hundred feet or so of the British trenches.

Suddenly von Richthofen's machine, which was a Fokker triplane, dived vertically into the ground and broke up completely.

Infantry left the trenches at considerable risk, and rescued his body, despite a barrage put up by the enemy.

Considerable doubt exists as to whether he was hit by machine gun from another aeroplane or from the ground, though one account says that the course of the bullet through his chest, travelling in a horizontal direction from left to right, would rather suggest that it came from an aeroplane.

The Assistant Official correspondent with the Australian Force says that the bullet was probably fired by a Lewis gunner attached to a battery of Australian Field Artillery, but is quite willing to admit the possibility of the claim of a British aviator.

The German official view on this subject was as follows :—

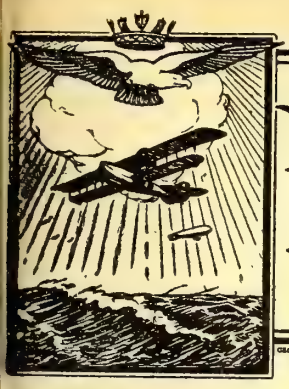
"According to the unanimous declarations of those accompanying him, and the observations of various spectators on the ground, Rittmeister von Richthofen pursued an enemy fighting aeroplane to the ground. He was at a low altitude, when apparently a defect in the motor forced him to land behind the enemy lines. As the landing was effected without mishap it where was hope that Capt. von Richthofen was captured unhurt.

"Reuter's report of April 23rd, however, no longer leaves any doubt that Rittmeister von Richthofen met his death. Since Rittmeister von Richthofen was the pursuer, he cannot well have been hit by his opponent in the air; he appears rather to have fallen a victim to a chance hit from the ground."

The Fokker triplane which Rittmeister von Richthofen was flying was painted red, and bore the number 2009. The motor was an imitation Le Rhone motor, built at the Oberursel Factory, Frankfort, and bore the date March, 1918.

The armament of the machine was two synchronised Spandau machine guns.

The funeral, which took place on the following day, must have been a very impressive ceremony. There were many wreaths on the coffin, one of which bore the inscription : "A valiant and worthy foe."



Six officers of the Royal Flying Corps acted as bearers. The procession passed slowly along the country road, saluted by hundreds of soldiers.

An Army chaplain read the English burial service at the grave which was made under a great hemlock tree just inside the cemetery gate. Officers, air mechanics, pilots who had met the dead aviator in battle, and French civilians listened to the words of committal.

A firing party paid him the last tribute of his enemies, and British aeroplanes circled overhead. So passed the greatest of our aerial foes to his last rest.

A NEW HUN TYPE.

It was reported from Paris on April 17th that a new German aeroplane has made its appearance at the front. It is the Pfalz D3, and is a one-seater chasing machine. Very small and less than 10 metres (32.8 ft.) in its spread, it reminds one of the Albatros, but does not seem capable of considerable ascension speed. Two Pfalz machines have already been brought down one by a French and the other by an American aviator.

NAVAL and MILITARY AERONAUTICS

FROM THE "LONDON GAZETTE."

Admiralty, April 22nd.

R.N.A.S.—Probv. Flt. Comdr. to be Flt. Comdr. :—J. H. d'Albiac, D.S.O., March 27th.

Flt. Obsr. to be Flt. Comdr. :—R. W. Gow, D.S.O., D.S.C., Dec. 31st, 1917.

War Office, April 23rd

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing.—Flt. Comdrs.—From Flying Officers, and to be temp. Capts. while so empld. :—Temp. Lt. J. P. Colin, Gen. List, Dec. 18th, 1917; Temp. Sec. Lt. J. S. Green, M.C., Gen. List, Jan. 9th; Lt. A. L. Chick, Essex R., T.F.; Temp. Sec. Lt. A. F. Woodward-Gregory, Gen. List, March 30th; Temp. Sec. Lt. H. Liver, Gen. List, March 31st.

Special Appt.—Graded as a Flt. Comdr.—The appt. of Lt. E. N. Grimble, Herts R., T.F., notified in the "Gazette" of Jan. 28th, is cancelled.

Adjts.—Lt. D. G. Nairn, A.S.C., T.F., to be secd., and to be temp. Capt. (without the pay and allces. of that rank) while so empld., Feb. 7th; Lt. (temp. Capt.) W. Benn, D.S.O., Yeo., T.F., from a Flying Officer (Observer), and to retain his temp. rank, with pay and allces. as Lt., March 30th.

Balloon Co. Comdr. (Graded as a Flt. Comdr.).—Lt. E. G. N. Grimble, Herts R., T.F., from a Balloon Comdr.) (graded as a Balloon Officer), and to be temp. Capt. while so empld., Dec. 11th, 1917.

Depôt Comdrs.—And to be temp. Lt.-Cols. while so empld.—Temp. Maj. S. Janson, A.S.C., from an Equipt. Officer, 1st Cl., Feb. 7th; Temp. Maj. R. F. Stapleton-Cotton, Gen. List, from Special Appt. (graded as a Park Comdr.), March 25th.

Special Appts. (Graded as Park Comdrs.).—And to be temp. Majs. while so empld.—Temp. Capt. C. H. D. Bonnett, Gen. List, from a Special Appt. (graded as Equipt. Officer, 1st Cl.), March 10th; Temp. Capt. J. H. S. Annesley, Gen. List, from an Adjt.; Capt. G. H. Errington, N. Staff. R., Spec. Res., from an Adjt., March 12th.

Gen. List.—The follg. from R.F.C., to be temp. Sec. Lts.—Ord Cl. Air Mechs.—J. L. Kirby, Dec. 29th, 1917; A. MacBean, L. V. Quick, Dec. 31st, 1917; A. G. Willcox, Jan. 6th; E. Rose, Jan. 11th.

Memorandum.—Temp. Serjt.-Maj. W. L. Rennie, from R.F.C., to be Sec. Lt., while serving with R.F.C., March 30th

* * *

With reference to the awards conferred as announced in the London Gazette," dated Dec. 17th, 1917, the following are the statements of service for which the decorations were conferred :—

The Distinguished Service Order.

Spec. Lt. R. C. Steele, R.F.C., Spec. Res.

He has done consistent good work in aerial fighting during eight months. On one occasion he brought down within our lines an enemy scout of the latest type, and, landing alongside it, made the enemy pilot a prisoner before he could destroy his machine.

A Bar to the Military Cross.

Temp. Sec. Lt. M. B. Frew, M.C., Gen. List and R.F.C.

For conspicuous gallantry and devotion to duty in shooting down three enemy machines in two days. He has destroyed eight enemy machines and driven down many others out of control.

Lt. R. A. Maybery, M.C., Lrs. and R.F.C.

For conspicuous gallantry and devotion to duty as leader of offensive patrols for three months, during which he personally destroyed nine enemy aeroplanes and drove down three out of control. On one occasion, having lost his patrol, he attacked a formation of eight enemy aeroplanes. One was seen to crash, and two others went down out of control, the formation being completely broken up.

Temp. Sec. Lt. L. A. Powell, M.C., Gen. List and R.F.C.

Since his name was last brought to notice he has destroyed eight hostile machines. On one occasion, with his pilot, he engaged 11 enemy aeroplanes, his pilot bringing down one. On another six Albatros scouts and two two-seaters were encountered, two being brought down and three others engaged with indecisive results.

The Military Cross.

Lt. (temp. Capt.) J. M. Burd, R.F.A. and R.F.C.

For conspicuous gallantry and devotion to duty as a leader of long-distance bomb-raids. When returning from a raid he attacked 10 enemy aeroplanes, which were engaged with another of our formations. He shot down two and his observer another, and he then brought his formation back without loss. In six raids he only lost one machine. He has been leader in 17 operations and deputy leader in 11.

Lt. E. D. Clarke, R.F.C., Spec. Res.

He has shot down five enemy machines. In an attack he repeatedly dived to within 50ft. of the enemy infantry, firing 500 and 600 rounds. Though struck by a piece of shell, which wounded him in both arms and shattered both petrol tanks, he succeeded in gliding back behind our lines

Temp. Sec. Lt. W. Durrand, Gen. List and R.F.C.

As a patrol leader he is dashing and determined. He has shot down seven enemy machines.

Temp. Capt. H. O. W. Hill, R.F.C.

He carried out artillery observations on a hostile battery for three and-a-half hours, subjected most of the time to heavy anti-aircraft and machine-gun fire. Nevertheless, he directed the shooting most successfully. He has attacked hostile aircraft on 23 occasions and driven them off; in one of these attacks he succeeded in driving off five enemy aeroplanes, although his observer was wounded. He has shown great skill.

Sec. Lt. D'A. F. Hilton, R.F.C., Spec. Res

For conspicuous gallantry and devotion to duty in attacking enemy aircraft and engaging troops on the ground. While on patrol he attacked single-handed six two-seater machines, forcing one down and driving the rest back. He has driven down five other machines.

Sec. Lt. H. H. Maddocks, Gen. List and R.F.C.

Whilst attacking two hostile aeroplanes he saw an enemy machine attacking one of his patrol. He at once attacked the enemy machine, which was seen to crash. On one occasion during a fight between seven enemy machines and a patrol of our scouts, he engaged one of the enemy machines, causing it to drop from 6,000 ft. to 1,000 ft., where it caught fire and dived vertically down. On two other occasions he drove down an enemy machine after a short fight. He has done consistent and continual good work.

Capt. J. J. L. Williams, Yeo., attd. R.F.C.

He shot down three hostile aeroplanes in a very short period, showing great initiative and fearlessness on all occasions.

Air Ministry, April 23rd.

R. A. Force.—The following appointments are made at the Air Ministry :—

Deputy Chief of the Air Staff.—Lt.-Col. (temp. Brig.-Gen.) R. M. Groves, D.S.O., and to retain his temp. rank while so empld., April 17th.

Medical Administrator.—Maj.-Gen. R. C. Munday, March 5th.

Assistant Medical Administrator.—Lt.-Col. C. B. Heald, April 1st.

Staff Officer 3.—Capt. E. V. King-Hall, April 1st; Lt. (temp. Capt.) C. K. Jupp, April 1st; Capt. Hon. R. G. Winn, April 8th.

E. B. Ashmore, C.M.G., M.V.O. (Bt. Col., temp. Maj.-Gen. in Army), is granted a temp. commn. as Maj.-Gen., April 19th.

Flying Branch.—Lts. to be temp. Capts. while empld. :—Capts. (Flying) :—D. R. Maclaren, April 6th; W. L. Harrison, April 7th; J. W. Aldred, M.C., April 15th.

Administrative Branch.—Capt. E. H. C. Bald, M.C., to be temp. Maj. whilst specially empld., April 10th.

Lt. (Hon. Capt.) H. C. Waghorn to be temp. Capt. while empld. as Admin. Capt., April 3rd.

Lt. C. A. Pelham to be temp. Capt. while empld. as A.D.C., April 10th

The following are granted temp. commns. as Capts. while empld. as Courts-martial Officers :—M. B. O'Brien (Capt., Lond. R., T.F.), April 4th; S. S. Macaskie (Capt., Lond. Yeo., T.F.), April 5th.

Lt. H. C. G. Allen to be temp. Capt. (without the pay and allowances of that rank) while empld. at the Air Ministry, April 13th.

The following relinquish their commns. on ceasing to be empld :—Temp. Lt.-Col. F. R. Hedges, April 7th; Lt. R. D. Sampson, April 9th; Lt. E. B. H. Johnson (R.F.A., Spec. Res.), April 24th.

Sec. Lt. P. J. Webb relinquishes his commn. on account of ill-health, April 24th.

Technical Branch.—Lt. H. Cooke-Smith to be temp. Capt. while empld. as a tech. Capt., April 9th.

Sec. Lt. (temp. Lt.) W. S. Renwick to be Lt. whilst empld. as a temp. Lt., April 4th.

War Office, April 24th.

REGULAR FORCES.—Staff.—Special Appointments.—Graded for purposes of pay as a Brig. Maj. while empld. as Asst. Comdt., R.F.C., Cadet Wing.—Capt. A. Gallaher, D.S.O., D. Gds., to be secd., and to be temp. Maj. while so empld., March 15th.

Establishments.—R.F.C.—Mil. Wing.—The following appts. are made :—

Flt. Comdrs.—From Flying Officers, and to be temp. Capts. whilst so empld. :—Temp. Sec. Lt. D. A. Stewart, Gen. List, March 25th. Lt. J. T. Quick, Devon R., T.F., March 29th.

School of Instrn.—Central Flying School.—Instrs.—Temp. Capt. A. W. Keen, M.C., Gen. List, a Flt. Comdr., vice temp. Lt. (temp. Capt.) H. M. Sison, M.C., A.S.C., Nov. 30th, 1917. Lt. (temp. Capt.) H. A. Wood, M.C., Spec. Res., a Flt. Comdr., vice Capt. (temp. Maj.) A. C. Clarke, Welsh R., Dec. 27th, 1917. Sec. Lt. (temp. Capt.) W. R. S. Wilberforce, M.C., K.R. Rif. C., a Flt. Comdr., vice temp. Capt. (Sec. Lt., Res. of Officers) Lord G. H. L. Dundas, Gen. List, Jan. 3rd. Lt. (temp. Capt.) K. L. Caldwell, M.C., Spec. Res., a Flt. Comdr., vice Capt. C. M. Crowe, M.C., Spec. Res., Feb. 21st. Lt. (temp. Capt.) G. L. Lloyd, M.C., Yeo., T.F., a Flt. Comdr., vice Lt. (temp. Capt.) H. A. Wood, M.C., Spec. Res., March 2nd. Lt. (temp. Capt.) R. S. Lucy, Worc. R., T.F., a Flt. Comdr., vice Lt. (temp. Capt.) K. L. Caldwell, M.C., Spec. Res., March 18th.

Gen. List.—Capt. H. W. Stockdale, S. Afr. Def. Force, to be temp. Capt., Sept. 4th, 1917. To be temp. Sec. Lt. :—1st Cl. Air Mech. S. A. Odell, from R.F.C., March 23rd.

Memoranda.—To be temp. Maj.-Gen. :—Col. (temp. Brig.-Gen.) D. E. Cayley, C.M.G., Worc. R., March 12th.

Maj. A. M. Grenfell, D.S.O., Yeo., T.F., from a Spec. Appt. (graded for purposes of pay as a Brig.-Maj.), to be temp. Lt.-Col. while empld. as Comdt., R.F.C., Cdt. Wing, March 15th.

War Office, April 25th.

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing.—Flt. Comdrs.—From Flying Officers, and to be temp. Capts. while so empld.—Temp. Sec. Lt. J. A. Pattern, Gen. List, Dec. 23rd, 1917. Sec. Lt. R. H. Martin, R. Muns. Fus., and to be secd., March 20th.

Special Appts.—Graded as Park Comdrs.—March 9th :—Temp. Lt. (temp. Lt.-Col.) G. R. Moser Arg. and Suthd. Highrs., on relinquishing the appt. of Comdt. (graded as a Depot Comdr.), Schools of Aerial Gunnery, and to revert to the rank of temp. Maj. while so empld.; temp. Sec. Lt. (temp. Lt.-Col.) A. R. C. Cooper, Gen. List, on relinquishing the appt. of Comdt. (graded as a Wing Comdr.), Schools of Aerial Gunnery, and to revert to the rank of temp. Maj. while so empld.

Gen. List.—The notification in the "Gazette" of April 8th, 1918, regarding temp. Sec. Lt. (temp. Capt.) F. J. Wood is cancelled.

1st Cl. Air Mech. E. A. Gay, from R.F.C., to be temp. Sec. Lt., March 23rd.

* * *

With reference to the awards conferred, as announced in the "London Gazette," dated Jan. 18th, 1918, the following are the statements of service for which the decorations were conferred :—

The Military Cross.

Lt. (Temp. Capt.) B. P. G. Beanlands, Hamp. R. and R.F.C.
He has brought down three enemy aeroplanes out of control and driven down several others over the enemy lines.

Temp. Sec. Lt. R. R. Bentley, Gen. List and R.F.C.
When information was urgently required during an attack and several attempts to obtain it had been unsuccessful owing to exceptionally bad weather conditions, he went out and succeeded in gaining the necessary information, flying at a height of about 50 feet under heavy rifle and machine-gun fire. He had already made a flight under similar conditions on the same day. His pluck and determination were a fine example to his squadron.

Temp. Lt. P. T. Carden, Gen. List and R.F.C.
When acting as observer he made a successful wire reconnaissance along a corps front at a height of 300 to 800 ft. under heavy machine-gun and rifle fire. On another occasion while observing during a reconnoitring patrol, he and his pilot had four encounters with enemy aeroplanes, in one of which they were attacked at 8ooft. by five enemy scouts. He kept up a continuous fire, and drove off the enemy, and completed a valuable reconnaissance. He showed the greatest keenness and determination at his work.

Lt. (Temp. Capt.) R. M. Charley, R.F.C., Spec. Res.
He attacked a hostile balloon which was eventually brought down in flames. With four other pilots he attacked eight enemy scouts and drove two down. He has driven down four other enemy aircraft, usually fighting with his patrol against greatly superior numbers.

Sec. Lt. C. G. Fenton, R.F.C., Spec. Res.
In spite of frequent thunderstorms, and the use of smoke screens by the enemy, he ranged a battery on a hostile battery position, obtaining eight good hits, destroying two gun-pits and causing a large explosion. He afterwards ranged them on to another battery, destroying a gun-pit, obtained three direct hits on a farm full of troops, and then silenced four batteries. On at least two other occasions he ranged the battery with remarkable success.

Sec. Lt. H. Hammond, Dorset R. and R.F.C.
Having successfully bombed a station behind the enemy lines he was wounded in the arm and fainted. On recovering he again took control, but shortly afterwards lost consciousness once more. His coolness and courage in spite of pain and loss of blood were remarkable. On several occasions he had bombed and derailed trains, and destroyed hangars at hostile aerodromes. He invariably set a fine example of courage and skill.

Lt. (temp. Capt.) H. Hewett, R. Berks R. and R.F.C.
For conspicuous gallantry and devotion to duty when co-operating with heavy artillery. He performed gallant and valuable work, which resulted in the partial destruction of an enemy railway bridge.

Lt. F. H. Holmes, R.E. and R.F.C.
He observed for 37 destructive counter-battery shoots, and shot down two enemy aeroplanes which attacked him.

Temp. Sec. Lt. H. Howard, attd. Northd. Fus. and R.F.C.
As observer, having successfully bombed a station behind the enemy lines, he took control of the machine on his pilot fainting from a bullet wound in his arm. He managed to keep the machine level and flew it until his pilot recovered. Shortly afterwards the latter again lost consciousness, and this officer took the control once more, managing to land the machine under very difficult circumstances well behind our lines. This officer has always shown a fine example of courage and skill in the many night bombing raids in which he has taken part.

Lt. G. R. Hunter, Camn. Highrs. and R.F.C.
After completing four successful bombardment shoots in one flight, giving 96 observations, he was attacked by seven enemy aeroplanes, but drove them off. On another occasion, though attacked by four enemy aeroplanes, he obtained the information he desired, and rendered his report.

Lt. (temp. Capt.) C. T. Lally, R.F.C., Spec. Res.
For conspicuous gallantry and devotion to duty in many bomb raids and photographic and long-distance reconnaissances, many of which he has led most successfully. He has taken part in numerous combats, and has destroyed three hostile positions. When ordered to bomb a position he spent 1½ hours looking for it, then returned for more petrol, and at the second attempt dropped a bomb on it, and with another set a dump on fire, under most difficult weather conditions.

Lt. A. Mann, A.S.C. and R.F.C.
He successfully took photographs though attacked by several enemy aeroplanes, one of which he drove down. On another occasion, though attacked by four Albatros scouts, and driven down from 9,500 ft. to 4,000 ft., he drove off the enemy and completed his task.

Lt. (temp. Capt.) C. E. H. Medhurst, R. Innis. Fus. and R.F.C.
He successfully bombed from a low altitude hostile batteries which were in action, and silenced their fire.

Sec. Lt. P. J. Moloney, R.F.C., Spec. Res.
When on patrol he was attacked by six hostile aeroplanes which dived at him out of the clouds. In the first burst of fire he received a severe wound, his control wires were very badly cut, and several of his flying wires were shot away. Despite this he attacked four of the enemy aeroplanes, one of which disappeared, another crashing down out of control. Feeling very faint from loss of blood he then made for our lines through the nearest clouds. Though the fog was very thick he succeeded in landing his machine undamaged behind our lines. On another occasion, when on patrol, he engaged the leader of a hostile formation, and drove him down. Though he suffered from engine trouble, he finally succeeded in driving off another enemy scout which had attacked him. This officer's tenacity and pluck are worthy of the highest praise.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

THE FOKKER TRIPLANE.

A good deal has been heard of late of the new Fokker triplane which is apparently being much used by the German fighting pilots. This machine is obviously copied from the Sopwith triplane, and is a German attempt to produce a small quickly-manœuvrable machine, apparently specially for fighting at the lower altitudes, owing to the fact that the very high-powered Albatros chasers with their heavy fixed-cylinder engines are, in spite of their high speed, at a distinct disadvantage in the type of rough-and-tumble fight between a number of aeroplanes at the same time, which is commonly known in the R.F.C. as a dog fight.

The Albatros seems to depend for its effect on one rush, generally in the form of a dive from above, but it is unable to spin round, or loop, or turn in the same small radius which is possible to the lighter and lower-powered British fighting machines. Hence, the introduction by the Germans of this new triplane.

The following description of a captured Fokker of the new type is taken from an article by M. Lagorgette in the first March issue of "L'Aérophile."

M. Lagorgette writes more or less as follows:—

The enemy triplane is in effect a copy of the Sopwith triplane. The analogy between the two machines is very great, but there are, all the same, differences: thus, the disposition of the wings is the same in the two types, but the form and dimensions differ considerably.

In the Fokker the three planes have neither a dihedral nor an arrow angle. They are staggered vertically, and the spans are unequal, growing smaller from the top plane to the lowest. In form they are rectangular.

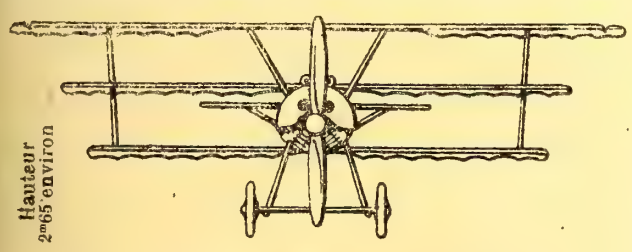
The upper plane alone—which is the largest—has ailerons which project beyond the wing-tips.

The main spar is 7 ms. in length. Adding the width of the ailerons, one obtains the total span of about 7.6 ms.

The top plane being cut away in the middle to a considerable extent enables the pilot to see easily above him.

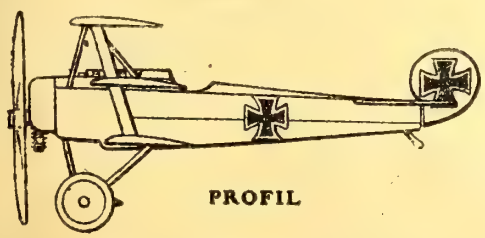
The middle plane, situated 0.75 ms. below the top plane, has a span of about 6.4 ms. The butts of the spars are attached to the fuselage on a level with the top of the cockpit.

The lowest plane which is again 0.75 m. below the middle plane is fixed to the base of the fuselage, and consists of two wings, each 2.5 ms. in length.

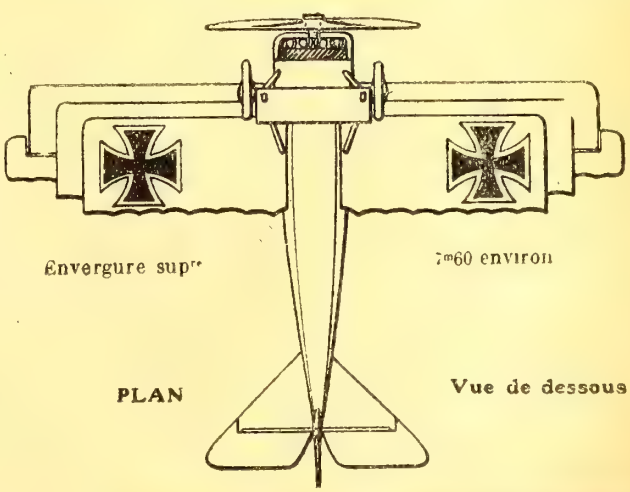


The chord of all three planes is the same—about 1.2 ms.—and, on each side, there is a single interplane strut which is very wide and holds both spars of each plane.

The remarkable thing about the machine, however, is that there are no cables, nor any other form of tension members to the



(From a German photograph.)



The Fokker Triplane in the Air.

FACE

PROFIL

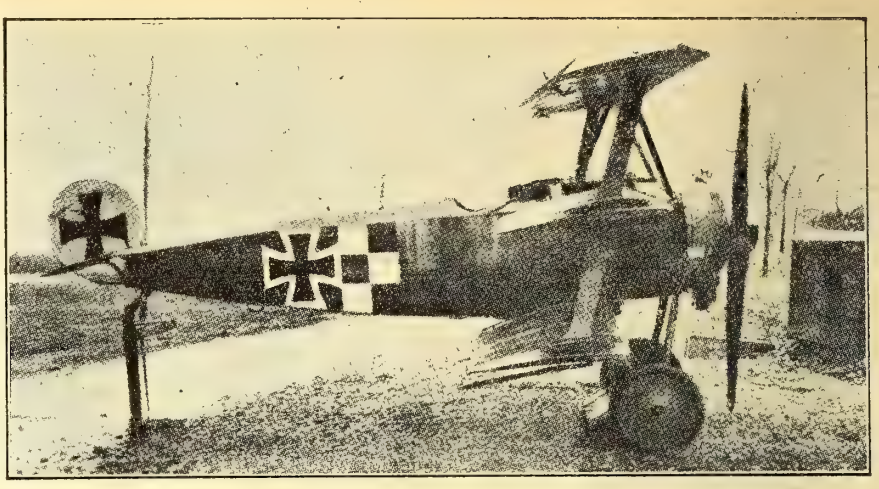
PLAN

Vue de dessous

wings. The centre section struts, or cabane, diverge from the fuselage to the top plane, as in various other types of German machines when viewed from front or rear, but when viewed broadside these struts converge, forming an inverted V.

Controls.—The skeleton of the control members is metallic. The rudder is balanced, and is of the familiar Fokker type without a fixed fin. The elevator is, however, quite different from the ordinary Fokker practice. There is a large fixed tail-plane in the form of a triangle with the outer corners cut away to make room for the forward-projecting balanced sections of the elevator, the tail-plane and elevator together forming a large triangle with rounded corners.

Fuselage.—The fuselage is a girder construction of steel tubes covered with fabric. According to usual Fokker practice it is hexagonal in form, but ends up with a vertical stern-post, contrary to the usual Fokker practice in which the fuselage terminates with a horizontal bar similar to the Morane.



Engine.—The engine is an Oberursel rotary of 100 to 110 h.p., which is now practically a Le Rhône instead of being, as formerly, a Gnôme. The airscrew is an "Axial," with a diameter of 2.6 ms.

Undercarriage.—This is of the usual type, but has a very deep streamlined axle. It is furnished with two relatively large wheels, 710 mm. by 85 mm. placed 1.6 ms. apart.

The streamlining of the axle is, in fact, so deep that it forms a fourth lifting surface.

Armament.—Two fixed Spandau machine-guns are carried, firing through the airscrew either together or separately. They are put in action by the motor, and are controlled by Bowden wire.

Apart from this particular machine the Fokker Company construct other triplanes of greater span. The Germans state that these machines can climb to 4,500 ms. (practically 15,000 ft.) in 17 minutes. It is also stated that the late Rittmeister Baron von Richthofen used one of this type.

Side View of the Fokker Triplane.

REPORT ON THE FOKKER TRIPLANE.

The following report, which has been issued by the Technical Department of the Department of Aircraft Production, Ministry of Munitions, is a brief critical summary of the data obtainable from the Fokker Triplane now in the Aircraft View Rooms, together with such preliminary information as has been received from the Expeditionary Force. A fuller report may be issued in the near future, if further inquiry shows that the machine has features of interest. At present, however, the Fokker appears to be one of the poorest of modern German designs.

General Description.

As regards outline design, the machine is somewhat similar to the Sopwith Triplane and is in general of orthodox type.

The chief point which arises from a preliminary examination is the absence of external bracing wires. This point will be dealt with later.

Constructional Design.

It is from this standpoint, probably, that the machine is of greatest interest. The designer appears to have made every effort to reduce head resistance, even at the expense of increase in weight. In some respects, also, his efforts have tended to grave structural weakness.

Wing Structure.

The unique "twin" spar is shown in Fig. 5. It consists of two box-section tapering spars joined by transverse ply-wood. As far as can be gathered at present, the fore and aft shear strength of this built-up member is supplied by one port and one starboard bulkhead of ply-wood in each plane. This appears quite inadequate, especially in a high speed machine, even if we disregard the possibility of buckling of the laterally-unstabilized ply-wood in nosediving.

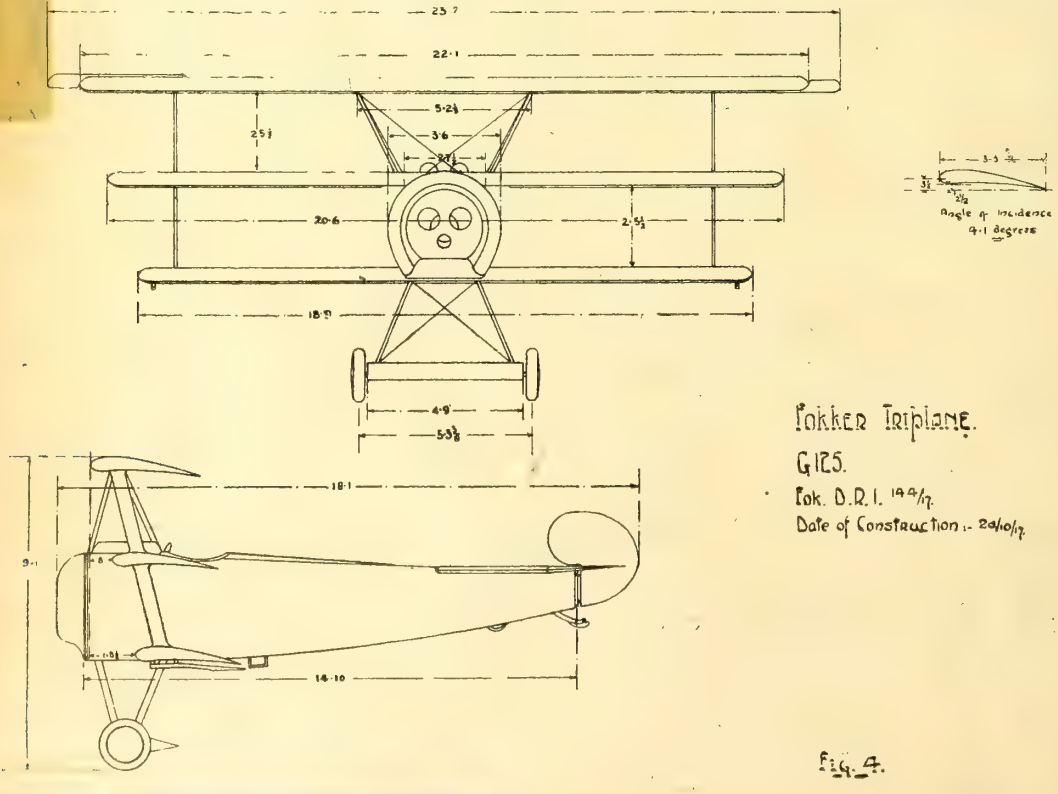


Fig. 4.

Apart from this point, the internal wing structure presents no peculiarities. From the front spar to the leading edge, the upper surface is stiffened with ply-wood as is usual on many modern scouts.

The nature of the main cellule structure is a typical example of the high price paid for reduction of resistance. Interplane wiring is dispensed with, and structurally the main frame may be regarded as three pairs of cantilevers, tied by pseudo-struts near the wing tips.

On a machine of relatively short span this cantilever construction may be rendered possible by the use of spars of great depth, and the ply-wood box type spars employed meet this condition, owing to the abnormally high thickness-chord ratio of the aerofoil section.

It is questionable whether the gain in

AIRCRAFT MANUFACTURING COMPANY——LIMITED

Contractors to

War Office and Admiralty

London Office
27, BUCKINGHAM GATE, S.W.1.

Offices & Works
HENDON, N.W.9.

overall efficiency by deletion of bracing wires is sufficient to balance the loss due to the use of a "high lift" section; this question naturally becomes more acute at high speeds, especially when at altitudes not approaching the ceiling; it is also rendered acute by the abnormally small gap-chord ratio employed.

The function of the interplane "struts" appears to be that of ties which partially distribute the load from plane to plane. Their section is such that they can hardly be expected to withstand reverse loading, and it is thought that this fact may be one explanation of the bad name which the Fokker has earned by breakage in the air.

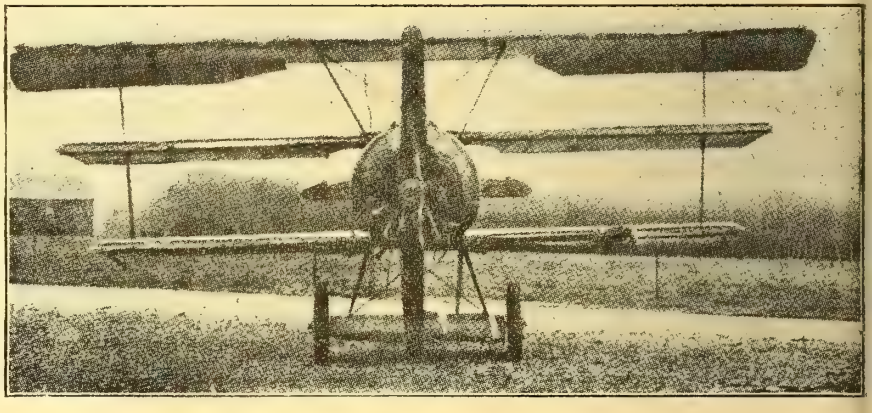
Rear View of the Fokker.

Tail Unit Structure.

Here again we find that reduction of resistance has been attained by deletion of external bracing. In this case, however, the tail unit being largely of tubular construction the cantilever structure, beside being heavy, is very weak. The proportions of the framework are approximately such as obtain on most normally-braced frameworks, and once more an explanation suggests itself for the structural failures experienced on this type.

Fuselage Structure.



The framework of the fuselage is built up from steel tubing butt-welded at the joints. The standard wiring attachments consist of a short length of small tubing bent to the form of a quadrant or semi-circle (as required), and welded into the corners of cellules (see Fig. 7). The bracing wires are looped round these attachments, doubling back upon themselves (see Fig. 7), thus functioning as a single wire of double length.

Splices are dispensed with, but beyond that nothing good can be seen in this method of wiring, which is heavy and very weak, as its "fixing strength" is that of a wire doubled round a small diameter pin in place of twice that strength, as is obtained by splicing.

The use of welding in the building up of the fuselage also appears to be a weak feature. Vibration and reversal of stress cannot be taken adequately by such a structure. The corner attachments are somewhat reminiscent of the well known Short U-bolt. The U-bolt had the standardisation advantages of the Fokker fitting, and, in addition, without further sacrifice in weight, was a far more reliable and robust wiring attachment.

Summary of Constuctional Criticism.

On broad lines little good can be said of the Fokker structure. The designer appears to have employed considerable ingenuity (or exhibited considerable mental slackness) in devising schemes whereby slight increase of manufacturing speed has been purchased at the price of grave structural weakness or increased weight.

Front View of the Fokker.

Where speed of production has not tempted him, his aim has been reduction of resistance. Here also, strength—and above all, permanence of structural rigidity—has been disregarded, and yet it is hard to see what notable gain of "fineness" has been attained.

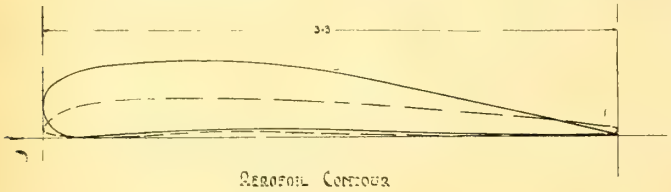
Wing Tip Skids.

These are rigidly-fixed ash skids located under the wing struts. The reason for fitting them is obscure, as they can only come into play as a result of an appallingly poor landing, and if they did come into play, would certainly buckle the flimsy interplane struts.

Aerodynamical Features.

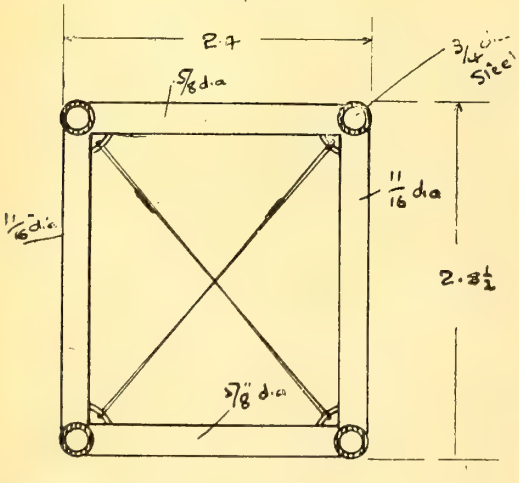
Certain of these features have been mentioned already. In this respect also, the design shows evidence that it has been carried out hastily and in a slovenly manner. There are signs of considerable ingenuity, but they are often marred by lack of broad consideration.

Wing Design.



Here, for instance, we have the elimination of external wiring. The "wireless" machine is not a new idea; many constructors have realised its good points, namely, the saving of wire resistance, and the diminution of tuning-up troubles.

The Fokker designer has missed the counterbalancing defects, and his method of attack has led him into two grave faults. In the first place, the cantilever construction adopted is not only weak, but essentially non-rigid. The deformation under manœuvring stresses and the consequent variations of aerodynamical load-distribution would appear to render the problem of controllability curiously complicated.



Further, the high cambered section of the aerofoils cannot but counteract the slight advantage due to the saving of wire resistance. Experience has shown that "low lift" aerofoils cannot be beaten for use on scouts, and that whatever advantage in climb and altitude-flying capacity may be attained by the use of "high lift" sections is cancelled and far more than cancelled by the excessive horse-power required at fine angles of attack.

When one considers the triplane effect (especially on small gap) which must, from first principles, obtain with such a deeply-cambered section the inefficiency of the main planes becomes evident.

Fig. 6 shows the amazing contrast between the Fokker section

(full line) and R.A.F. 15 (dotted line), which may be taken as typical of British practice for similar machines.

Controls.

All control surfaces are balanced, but the method of balancing is inferior to that employed on the Albatros.

Ailerons are fitted to the top plane only, a type of construction which has been shown to be inefficient.

Engine.

The Agricultural Hall machine has no engine, but information received from overseas states that the engine is an Oberursel, very similar to the 110 H.P. Le Rhone. In fact, it is understood the only differences are slight points of detail design, and the relative poverty of general finish. For instance, the nose piece is in two portions, the propeller shaft being separate from and bolted to the front plate of the engine.

The carburetter is a French-made Tampier bloctube, presumably obtained from a captured machine.

The oil pump appears to be a German copy of the standard Le Rhone oil pump.

The magneto is a Bosch.

Armament.

Two Spandau guns are fitted, firing forward through the propeller, and fitted with synchronising gear of the direct flexible drive type, a pinion on the flex shafting engaging with the gear wheel which meshes with the magneto and oil pump drives.

The guns are controlled by Bowden wires, from thumb-pushes on the control lever. Three pushes are fitted, two for firing the guns independently, and the third for simultaneous control.

Dimensions and Data.

(Certain Dimensions are also shown in the Figs.)

Identification Marks.

Weights (as stencilled on Machine).

Weight, empty	376 kg. =	829 lbs.
Permissible load (including fuel)	195 kg. =	430 lbs.
Total weight	571 kg. =	1259 lbs.

Weight of Engine.

334 lbs., including hub, magneto, oil pump, and carburett
(Note :—Weight of 110 H.P. Le Rhone is 330 lbs.).

Tank Capacity.

Oil, 4 gallons } approximate.
Petrol, 16 gallons }
(approximate duration—2½ hours at 10,000 feet).

From the above it is possible to construct the following a proximate weight analysis : —

Fuel, oil and tank	170 lbs.	allowing tank 18 lbs.
Crew	180 lbs.	
Military load	98 lbs.	
Engine and propeller	358 lbs.	(allowing propeller 24 lbs.)
Structure	453 lbs.	(including engine bearers and instruments).
Structure percentage	36	

Surface of main planes—205 sq. ft. (approximately).
Estimated B.H.P. (by analogy with 110 H.P. Le Rhone)—1
lbs. per sq. foot.—6.14.
lbs. per B.H.P.—11.15.

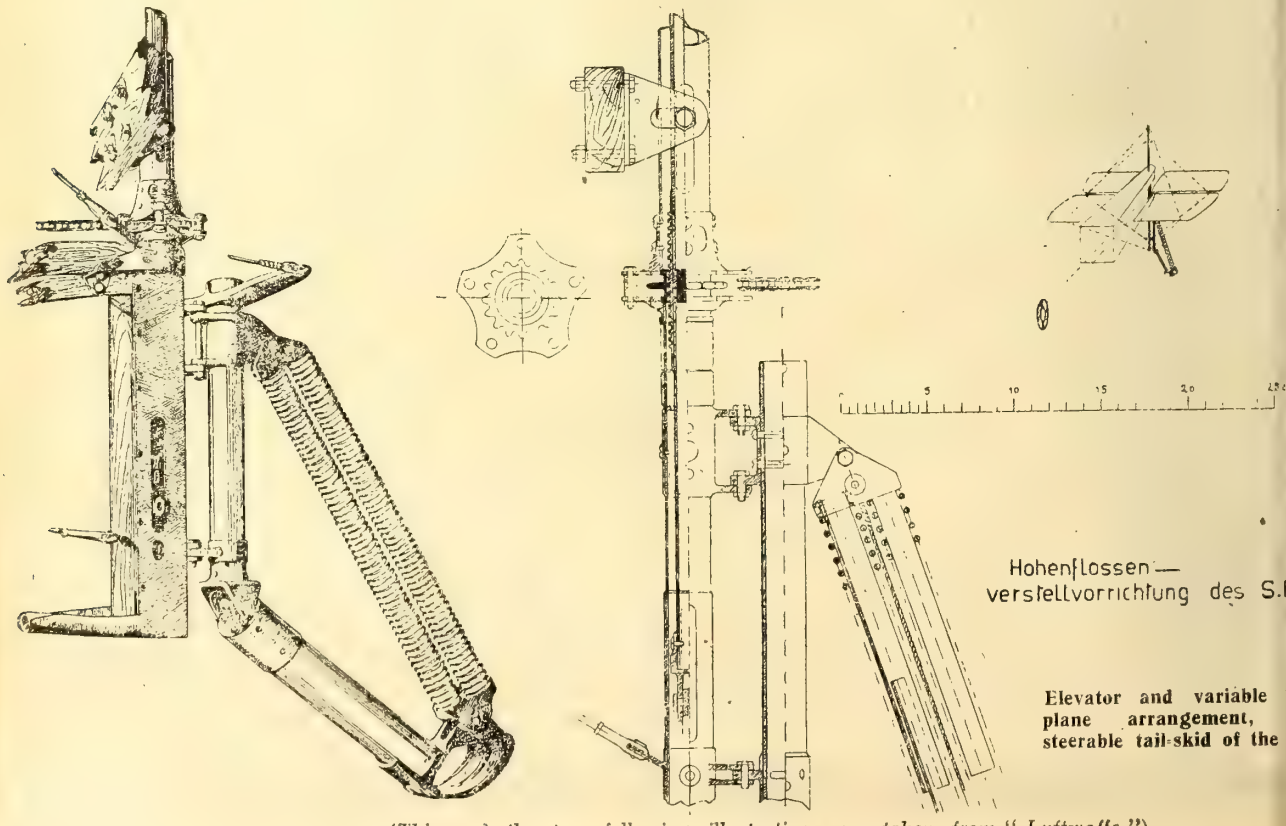
IN ENEMY EYES.

A Neutral Correspondent writes :—

Following is a translation of the description of the British S.E.v.A. (scouting experimental) fighting single-seater, published in the March issue of the German Airmen's Journal, "Luftwaffe," reading thus :—

The aeroplane in question was built by Vickers, Ltd., and numbered B.507, wearing further as recognition initial or that of a squadron an A as well as a white circle. The propeller is marked : S.E.v.A., which leads to the idea that the older model of this same aeroplane type with the 150 h.p. Hispano motor not geared down is called S.E.v.

The biplane has a surface of 22.8 square metres, and both planes, connected with but one pair of struts to each side, hav span of 8.15 metres, and a chord of 1.52 metres, the gap fr the top of the fuselage amounting to 0.45 metre.



No arrow-shape prevails. The V-shape of the equal-sized e of the upper and lower planes mounted on the centre section respective body rudiments amounts to 1.71 degrees.

The sight field of range is improved by cutting the centre s tion in the middle and the lower planes near the body.

Above the angle of incidence is 5 deg. mean, below by the b 6 deg., by the struts 5 deg.

Both plane spars show sections of I shape, whereas the lon rons of the rudiment pieces, running through the body are s

GALLAY ACHIEVEMENTS

Their excellence and the reasons thereof

1. Our **system of construction** is proved by Government test to be 15 per cent. more efficient than any other type with equivalent water space and air orifice.

2. It is **lighter** per B. Th. U. dissipated than any other type.

3. It is **stronger** and yields less to impact than any other systems and owing to homogeneity of structure it will stand greater stresses vertically, horizontally or frontal.

4. The strength is inherent and not dependent on **tanks** or **casings**. The latter can be entirely dispensed with.

5. Every particle of metal used in construction acts as a **cooling agent.**

6. Each **waterway** is **regular** throughout its length.

7. **Air resistance** is reduced to the **minimum**, no blobs of solder obstruct the air passages, a regular wind cutting edge is always presented.

8. We have **reduced** the **radiator factor** to limits hitherto considered impossible.

9. Our system is suitable for **pump** or **Thermo** syphon.

10. We are Aero engineers and our staff comprise **specialists** in each department.

The "Guardian Angel" Parachutes

THE GUARDIAN ANGEL PARACHUTES
TRADE MARK
(REGISTERED)

THE CLASS OF OUR LIFE-SAVING EQUIPMENT.

The basic characteristics of our Parachutes, which differentiate them from all others, and for which we hold master-patents, are automatic (i.e., compellative) opening, and static and kinetic control (i.e., control at rest and in action) of all their component details. The ordinary parachute is under no sort of control, and what we have accomplished is to convert this most insubordinate Apache of the Air into a staid servitor, incapable of acting in any other than the designed way. We have made the Parachute into an automatic machine, so that failure to open and entanglement of rigging has become a physical impossibility. Every Type of Parachute made by us possesses these paramount and indispensable principles of machine action. The aviator makes his jump, and the Parachute automatically does the rest.

THE RANGE OF OUR LIFE-SAVING EQUIPMENT.

Life-saving Parachutes for school machines on the Training Grounds.

Life-saving Parachutes for heavy bombing machines, fighters, and scouts.

Life-saving Parachutes with minimum weight and without additional air resistance for the fastest machine that flies, and capable of release from any vertical or horizontal angle, or when flying upside down.

Basket-Parachutes for instantly detaching the basket Balloons, with a high but constant-speed initial drop from a fired gas-bag, automatically opening into the low-speed descent required for a safe landing.

Basket Parachutes for instantly detaching the basket containing two observers, their instruments and records, from a fired gas-bag, with high-speed initial fall, changing automatically to slow-speed descent for the safe landing. Parachute instantly released on landing, to avoid dragging the basket.

Variable-speed Parachutes, to permit a sudden high-speed drop, controlled by the Parachutist, to escape from an enemy aeroplane, and to stop on any portion of the grade of descent to avoid an objectionable landing. This variable-speed apparatus is applicable to the whole range of our Parachutes.

Non-spinning shock-absorber slings, taking all shocks off Parachute and man.

Aviator's Harness, distributing the stresses over those parts of the body best able to sustain them, and instantly releasable when alighting on land, on a roof, in a tree, or in water.

OUR EQUIPMENT IS THE RESULT OF ENGINEERING SCIENCE APPLIED TO DIFFICULT AIR PROBLEMS. WE BELIEVE THAT ITS EXTENDED USE WILL DOUBLE THE FLYING LIFE OF OUR FIGHTERS AT THE FRONT.

RELIABILITY—First. *RELIABILITY—Second.* *RELIABILITY—ALL THE TIME.*

S.B.A.C. The Society of British Aircraft Constructors

SIR JOSEPH JONAS, COLVER & Co., LTD.

Manufacturers of Steel of every description, including

HIGH GRADE NICKEL STEEL & FORGINGS

for Naval and General Marine Purposes.

Special Heat Treated Alloy and other Steels for Aircraft and Automobile Purposes

IMPORTANT SPECIALITIES:

S.S.G. — **A SPECIAL NICKEL CHROME GEAR STEEL.**
FOR AIR OR OIL HARDENING. When treated this steel has exceedingly tough properties and is specially suitable for Gear Wheels, Connecting Rods, etc.

S.G.W. — **A NICKEL CHROME STEEL IN FOUR GRADES.**
Eminently suitable and strongly recommended for Gears, Crankshafts and other highly stressed parts, and having exceptional machining qualities. Combines unusually heavy shock-resisting and wearing properties with silent running.

G.P.S. — **A HIGH GRADE ALLOY CASE HARDENING STEEL**
for severely strained parts, such as Gear Wheels, Gudgeon Pins, etc.

Continental Steel Works and Novo Steel Works, Sheffield.

WORKS - WARRINGTON.

Victory

In concentrating to achieve a common victory in a common cause, we are acquiring knowledge infinitely valuable in the battle of commerce which will follow Peace.

Better organization, better machinery, better workers will result in the more expeditious production of a thousand and one requirements in the process of reconstruction.

And that indeed is another victory of infinite value to British interests both at home and overseas.

In our own case these facts are emphasized, and because we know the magnitude of our facilities we desire to get in touch with others like ourselves who are looking forward, and whom we can help in the huge production of Repetition Parts.

M

ALL-BRITISH

M-L

MAGNETOS

THE main features of "M-L" All-British Magnetos are great reduction in size and weight as compared with pre-war magnetos of the same electrical output, effective sparking at very low speeds and strict interchangeability—permitting prompt supply of spares.

The M-L Magneto Synd., Limited
Victoria Works, Coventry

tubes of 1.75 millimetre thickness, and 45 mm. outer diameter. The plane ribs show the usual construction of most British air craft.

There are no compression struts between the spars, some of the ribs being solid struts instead.

The interior wiring of the planes between the body and the struts is carried out in simple profile wire, that of the overhanging ends of thick-ended wire.

A wood strip forms the back edge of the planes. Further, two auxiliary ribs ranging from the leading nose edge to the main spar are arranged between each two ribs.

The fabric is sewed together with the ribs, and is painted yellow below, browned above, as is the fabric of the body. Shoe-eyes are arranged on the underside of the trailing edge of the plane to assess the pressure.

The centre section struts are covered steel tubes. The plane spruce struts rest in long stampings, serving as fixing points of the vertical wiring.

Profile wire is employed for the plane cross wiring with twin wires for those carrying load and single for the counter ones.

The two spars of the upper planes are strengthened further between the centre section and the struts with two wires each. Unbalanced ailerons are hinged to the back crossbar of the upper and lower planes.

The body shows the usual strut cum wire combination, being rounded above with half-circle frames and fairings, and having three-ply wood planking of 4 millimetre thickness to the pilot's seat. Fuselage longitudinals and struts have sections of I-shape, except the vertical struts behind the pilot's seat, which are worked out round.

The tail-plane is curved to both sides and fixed to the body, so that the angle of incidence can be varied during the flight within the limits + 4.5 deg. and — 3 deg. To this end the front spar is turnable, while the rear spar, with its wiring, is fixed to a tube, arranged shiftable to the body stern post. This tube rests with a piece of thread in a gear-nut, again resting in the stern-post fixed, yet turnable.

When the nut is turned from the pilot's seat by means of wheel and cable, the tube is displaced upwards or downwards, transferring thereby the same manœuvre on the rear spar of the tail-plane, and thus its angle of incidence changes.

The elevator hooked to the fixed tail-plane partakes in this movement. The wires for operating the elevator are led through the body and tail-plane, which certainly saves air resistance, yet makes twice a 20 deg. direction change of each wire necessary. Main and tail-planes are equipped with cellon windows, rendering a control of the rollers possible.

The under-carriage shows the normal form. The through-running axle rests between two auxiliary ones. There is no limit of the springing range.

The tail skid shows an unusual construction, being arranged turnable behind the stern post and connected with the rudder cable by intermediance of springs. A brass skid bow is sprung by means of two spiral pressure springs which are prevented from sideway turning by inserted telescope tubes.

According to the firm's sign board the Wolseley-Hispano-Suiza engine gave the 30th August, 1917, on brake 206 h.p. = 203 P.S. at 2005 revolutions. The r.p.m. of the four-bladed airscrew is geared down in the ratio of 4 to 3.

The exhaust gas is led behind the pilot's seat in two tubes to each side of the body. The motor sits so that there is free accessibility after removing the bonnet. The radiator forms the bow of the body.

A cover arrangement makes it possible to uncover the body about half way from the pilot's seat.

The main petrol tank of 120 litres' capacity is placed behind the motor on the upper fuselage longitudinals. A gravity tank of 17 litres capacity is arranged in the centre section between the leading edge and the main spar. The oil tank of a capacity of 14 litres lies cross in the engine frame below the rear edge of the motor.

The fuel suffices for a flight of about two hours' duration.

Following instruments are arranged in the pilot's seat:—

To right: A box for the light pistols; a contact breaker for the self-starter; a contact breaker for the two magnetos; a triple led cock for the gravity and pressure petrol; a triple led cock for the hand and motor air-pump; a thermometer for the water of the radiator; the petrol gauge placed on the back side of the main tank, and a manometer for air-pressure.

To left: Gas lever; lever for regulation of the gas in altitude flights; lever for operating the radiator blinds, clip for three light cartridges. On the bottom is further arranged a hand-pump for the hydraulic machine-gun gear; two boxes for drums for the movable machine-gun and the self-starter.

A square windshield of Triplex glass is placed in front of the pilot's seat. Behind it a box is arranged in a queer position to the body with access from outside.

The fixed Vickers' machine-gun lies to left of the pilot inside the body fabric. The cartridge girdle is of metal. The firing of the machine-gun takes place hydraulically by means of a control arrangement, placed in front of the motor and connected with the machine-gun through a copper main, as well as driven from the air screw by a gear set. The firing lever sits on the stick.

On the bow-shaped iron band lying on the centre section rests a Lewis gun, which can be pulled down during the flight to permit vertical firing.

The empty weight of the aeroplane was worked out at 706 kilos, distributed as follows:—

	kilos.
Engine	225.0
Exhaust collection	12.0
Self-starter	3.6
Radiator	23.8
Radiator water	31.0
Air screw	26.6
Main petrol tank	17.8
Gravity petrol tank	6.5
Oil tank	3.9
Motor equipment	6.4
Body with seat and plate covers	151.0
Tail-plane angle of incidence change arrangement	1.9
Under carriage	40.8
Tail skid	3.7
Pilotage arrangement	5.4
Planes with wiring	112.2
Vertical and horizontal wiring	21.0
Body equipment	14.0
	706.0

The fuel weight amounts with fully loaded tanks to 111 kilos., so that the total useful load can be calculated at 250 kilos., the total weight working thus out at 956 kilos.

The load of the planes is thus: $\frac{956}{22.8} = 42$ kilos per square metre.

The performance load is then: $\frac{956}{200} = 4.78$ kilos per horse-power.

THE AERONAUTICAL SOCIETY.

Mr. W. W. Hackett will give a lecture on "Tubing" before the Aeronautical Society on Thursday, May 2nd, at 7.30 p.m., at the Royal Society of Arts. Lt.-Col. R. K. Bagnall-Wild, R.E., will preside.

THE CHAIRMAN OF THE SUNBEAM CO.

Owing to the recent death of Alderman John Marston, J.P., at over four score years, the chairmanship of the Sunbeam Motor Car Co., Ltd., which he founded at the beginning of the century, became vacant.

At the last meeting of the Board of Directors, Mr. Thomas Cureton, hitherto Vice-Chairman of the Company, was elected to succeed to the office. This measure is a continuance of the tradition of the firm inasmuch as Mr. Cureton was chiefly responsible for causing the late Alderman John Marston to embark on the motor industry by the establishment of an entirely separate company in Villiers Street, Wolverhampton.

Mr. Cureton was the first Managing Director of the Company, and steered it through all the inevitable difficulties of a pioneer enterprise, holding that office right up to November, 1914, at which period the Company had passed successfully from peace-time production to war work.

Mr. Cureton's business career has always been associated with the late Alderman John Marston, to whom he was apprenticed in 1877, his ability being so marked from the outset that before he was 21 his "articles" were given back to him and he was treated as a grown man, being left in charge of a factory, which, in those days, was of appreciable proportions, employing three hundred hands.

A pioneer cyclist in the "high" bicycle days, Mr. Cureton had a good deal to do with inducing Alderman John Marston to take to the making of bicycles, and later both of them became equally keen on realising the possibilities of motor traction. Mr. Cureton, incidentally, was responsible for enlisting the services of Mr. Louis Coatalen, Chief Engineer of the Sunbeam Motor Car Co., Ltd.

AN ASCOL MILESTONE.

The Aircraft Supplies Co., Ltd., of 125, Long Acre, W.C.2, has already established a large connection in Birmingham and the surrounding Counties, but the expansion of Ascol Service is so rapid that the company has taken new offices at 54a, International Exchange, Edmund Street, Birmingham, which have been fitted up under the direction of the Brothers Serin.

Mr. L. J. Serin has represented Ascol House for some time in that district, but customers' wants have outgrown the possibility of the "Personal Touch" which he has established over a wide radius. Consequently, his brother, Mr. A. M. Serin, has left the important position he held at Ascol House, London, to assist in covering the Birmingham District and giving closer personal attention to clients.

The Design and Construction of Internal Combustion Engines, with special reference to Aero Engines.—V.

BY C. SYLVESTER.
Author of "The Conversion of Electrical Machinery," "Testing Motors and Motor Starters," etc., etc.

Gudgeon-Pins.

The gudgeon-pin may be said to be one of the most important parts of the internal combusion engine, since the movement of the connecting-rod is swinging and not rotary.

As stated in previous remarks, the pin is situated in, or near, the centre of the piston. In special cases, however, it is placed a little higher, the advantage of this being that a longer connecting-rod may be fitted without increasing the height of the engine. This merely refers to oil or gas engines where the connecting-rod is fitted to a piston-rod.

In aero-engine construction, gudgeon-pins are made of chrome nickel steel, bored hollow and hardened.

With reference to the dimensions of gudgeon-pins, it may be said that the pin is subjected to a bending moment of :—

$$\frac{Ph \times L}{4}$$

That is, where Ph equals the pressure on the cylinder head, and L is the total length between the centres of support. This is where pins are not exactly a tight fit.

When the pin is a tight drive into the piston, the bending moment may be taken as :—

$$\frac{Ph \times L}{6}$$

Gudgeon-pins may be tapered or parallel according to design. Parallel pins should be securely locked by means of circular springs let into a recess machined in the piston, or special springs may be fitted to prevent any lateral motion of the pin when it is fixed in position.

The diameter of pins vary according to the distance between the centres of support. In these calculations, hollow and solid pins have also to be taken into consideration, for in the case of hollow pins the portion bored out must be deducted because the moment of inertia is somewhat different. Otherwise, the calculations are the same.

As a guide to the diameters and clearances one quotes the dimensions of the gudgeon-pin used in a 160 B.H.P. Beardmore Aero-Engine.

Diameter of pin, 28 mm.
Fit of pin in piston, 28 mm. driving fit.
Fit of pin in small-end bush of connecting-rod. Minimum and maximum clearances, .002 in. and .004 in.
Float of connecting-rod on pin between piston bosses, 10 mm.

Connecting-Rod Design.

There is a considerable difference of opinion among designers concerning connecting rods. This may be understood when one considers that some designers are continually employed upon one class of work and very rarely touch upon other work. The result is that we see some engines with rods varying in length from four to six times the length of stroke, and even in small gas engines 2.5 times the length of stroke is not very uncommon.

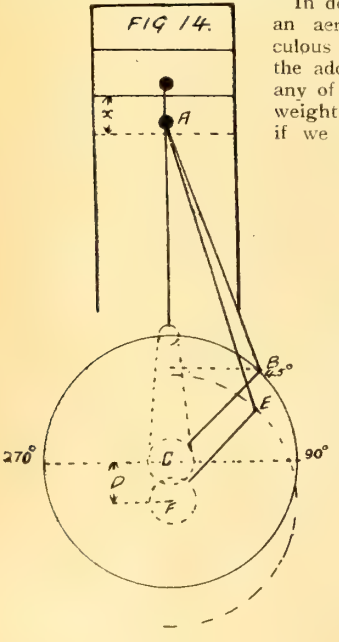

FIG 14.

In designing a connecting-rod for an aero-engine it would be ridiculous to consider, for one moment, the adoption of a connecting-rod of any of the above proportions. Here weight is the first consideration, and if we use as short a connecting-rod as is possible (providing of course that the obliquity is not so great that the side thrust becomes excessive) we may consider that the case is met.

Over and above all the outstanding features in connection with the design of connecting-rods it should be remembered that where long rods are used, in addition to the extra expenditure on material and labour for their production, the material must be of a much larger cross section so as almost to eliminate the bending stresses.

These stresses exist in every connecting-rod no matter on what type of engine they may be used. Thus, the rods used for aero-engines may be much shorter and lighter without approaching too near to the safety limits or exceeding reasonable bending stresses.

Minimum Lengths of Connecting-Rods.

Apart from the necessary mechanical strength, and ignoring the modulus of elasticity, the minimum length of connecting rods depend upon : The length of stroke and the height of the cylinder base from the top of the crank.

A glance at Fig. 14 will make this clear. Here we see a single cylinder, piston, connecting-rod and crank. Now, if we follow the outside of the circle of which the centre of the crank is the radius, it is clear that the maximum horizontal travel of the connecting-rod in one revolution is between the 90 and 270 degree points respectively.

We will now consider the position when the crank is on the 45 degree point, that is, if the length of stroke is twelve inches the piston will have moved X inches in a downward direction in the cylinder. In this case the position of the piston, rod, and crank will be as indicated by the lines A—B—C. When in this position there should be a clearance of at least 3 m/m to allow for the expansion, bending stresses, and whip of the rods when the engine is under full load.

In the diagram is shown purposely the connecting-rod touching the cylinder wall. If, however, we increase the distance between the centre of the crank and the base of the cylinder by the distance D, then, the position of the piston, road, and crank will be as indicated by the lines A—E—F. The alteration of crank and piston centres will, of course, necessitate a longer connecting-rod. This in turn calls for an increase in the cross sectional area of the rod, but this cannot be avoided as the minimum length of rod is now obtained.

Connecting-Rod Construction.

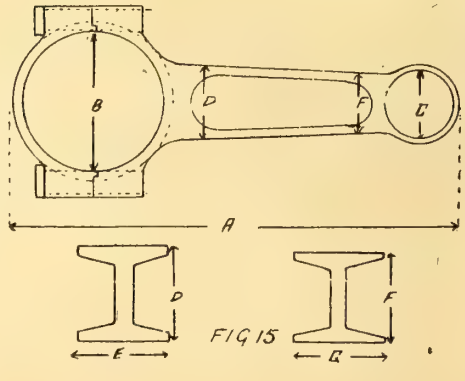
Connecting-rods for aero-engines are manufactured from forgings of a special air-hardening chrome nickel steel which, after being heat treated, has a tensile strength of about 280,000 pounds per square inch. They are machined and milled from the solid to an H section, and are very strong and light.

In Fig. 15 is illustrated a connecting-rod without bearings. Among other dimensions is shown the cross sectional area of a rod used on a 180 B.H.P. aero-engine : (a) 13.5 in., (b) $3\frac{1}{8}$ in., (c) $1\frac{1}{2}$ in., (d) $1\frac{5}{8}$ in., (e) $\frac{7}{8}$ in., (f) $1\frac{3}{8}$ in., (g) $\frac{3}{4}$ in.

The minimum and maximum thicknesses of these rods, at any point of the H section is $\frac{1}{8}$ and 3/16 of an inch respectively.

Connecting-Rod Bearings.

Gun metal is an excellent material to use for connecting-rod bearings. The "big-end" bearing is lined with Dowrance's



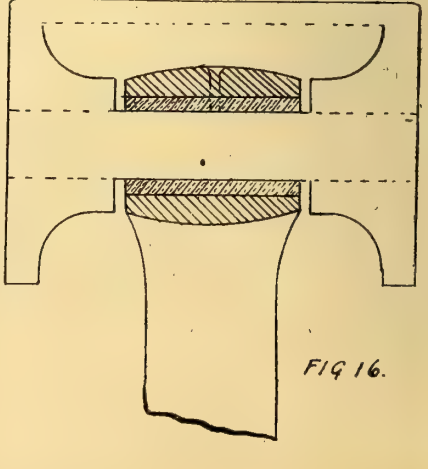


FIG 15

FIG 16.

CELLON

CELLON WORKS
GEOFFREY WATSON

or Babbit's metal, and should be a very neat fit in both lateral and diametrical positions on the crank.

There are no outstanding features in the design of connecting-rod bearings, except perhaps the methods of fixing them in the connecting-rods. There are several methods of doing this, dowel pins being favoured by some manufacturers while others prefer to fix the big-end bearings by means of the bolts which hold the two halves of the bearing together.

When the latter method is adopted, the sides of the bearing, where the bolts pass through the two halves, are grooved sufficiently long to prevent the bearing from turning.

The bearings for the small ends of connecting rods, which are almost always merely annular bushes, are made of gun-metal but are not lined with anti-friction material. In some cases the bush is a neat fit but is free to move laterally, in other cases the bush is merely pinned to the rod.

Considerable care must be taken in the boring and fitting of the bushes in the small ends of connecting-rods. If this is not done, it will not be possible to obtain a perfect alignment of the bush and the gudgeon-pin bush.

Fig. 16 illustrates the small end of a connecting-rod fitted on a gudgeon-pin in a piston.

Here the bush is shown pinned to the connecting-rod, the pin being fixed in the extreme end of the rod. Fitting the pin in this position does not interfere with the mechanical strength of the rod, for this part is subjected to the minimum amount of strain at any time.

Dimensions of Bearings.

There are no rules laid down for determining the dimensions of connecting-rod bearings. The diameter of the big and small ends is decided by the size of the crank and gudgeon-pin. The lateral length should be as large as possible.

In aero-engine design there is a tendency to make the length of big end bearings as short as possible. This is certainly bad practice and should be avoided.

The writer has had considerable experience with bearings of all types of internal combustion engines. In practice he has found that the length of the bearings should be as long as the mechanical strength of the crank will allow, and that the minimum length should not be less than the diameter of the shaft. That is, a crank having a diameter of three inches should have a bearing the minimum length of which should not be less than three inches.

(To be continued.)

HOW AN AEROPLANE IS BUILT.

A hand-book entitled "How an Aeroplane is Built," by Stepney Blakeney, has been published by The Aeroplane and General Publishing Co., Ltd., which it is hoped will fill the wants of various classes of people.

Regular readers of The Aeroplane will recollect that a series of articles on practical aeroplane construction appeared in The Aeroplane written by Mr. Blakeney, and various readers asked that they should be reprinted in book form.

The articles did not, and the book does not, profess to be a learned dissertation on factory methods, nor a series of hints and tips on aeroplane construction. It is intended to show in the simplest possible language the way in which a smallish firm, suddenly turned on to produce aeroplanes of an ordinary standard type, might set about the job with reasonable prospects of success.

In these days there are hundreds of thousands of men and women engaged in making aeroplane parts Very few of them know whereabouts in an aeroplane the part on which they are working is intended to go, or what it is intended to do when it gets there. Yet many of them would like to know, and would take a keener interest in their work if they understood the why and wherefore. This book will give such intelligent people a fair understanding of the reason for their work and of its importance in the complete aeroplane.

In drawing offices also there are many hundreds of fairly well educated men and women who, though they may be excellent hands at drawing and tracing, have no opportunity of going into the workshops and seeing how the work is done to their drawings, or of seeing what the finished component part looks like before it is put into its place in the machine.

Many of them, indeed, are so new to aeroplane work that they could not even locate in a general arrangement drawing the precise place where the component part which they have been drawing is intended to fit. They merely work to instructions, without intelligent appreciation of the reasons for those instructions.

Such people, also, will be able to acquire from Mr. Blakeney's description an all-round idea of how the parts of an aeroplane are made, and how they come together to form a complete machine, and it is hoped that this knowledge will help them to find their work more interesting.

Over and above the people in aircraft factories there are many thousands of others who are keenly interested in aeroplanes, and who, having a natural liking for things mechanical, are anxious to know by what general methods so much timber and metal is turned into a modern flying machine. These seekers after information will find in this book a simple and easily understandable account of the whole process of manufacture, from the rough plank and the metal sheet to the complete aeroplane ready to make its trial flight.

One believes, also, that in these days when every youngster at school desires to become an aviator, just as in our young days we aspired to be engine-drivers—motor-cars and aeroplanes being then undiscovered—Mr. Blakeney's simple descriptions of the various workshop processes which go to make an aeroplane will be highly appreciated by school-boys of the age at which they begin to study the motoring and flying papers.

It must not be thought that Mr. Blakeney's imaginary workshop represents the last word in the development of aircraft factory development. It is, as he points out, a small shop employing a hundred hands or so, and he has laid down its organisation so that it may be capable of expansion to any extent desired. It stands, in fact, in the safe middle position between the old aerodrome shed in which we used to build our aeroplanes some seven or eight years ago, and the kind of aeronautical sausage factory which will produce the Aerial Fords of the future. Therefore the digestion of the book may be regarded as an easily comprehensible undertaking for any intelligent person who is keen on aeroplanes, and who wants to learn in a general way how they are produced.

With regard to Mr. Blakeney's qualifications to write on the subject of aircraft construction, it is interesting to note that he spent 20 years as a railway engineer during which time he acted as constructional engineer as well as a workshop manager. He is a first class practical mechanic, and is capable of performing any job himself with the overseeing of which he is concerned.

Early in the war Mr. Blakeney left railway work and went to a well-known aircraft factory where he laid down the machine tools in a new machine shop; designed, bought the material for, and superintended the erection of a whole new section of the works; reorganised the whole output, and raised it to a rate which had never been thought possible, and generally did the firm much good. Since then he has been to certain other firms, each job being a step upward in responsibility, and at each he has added to his knowledge of the problems of organising an aircraft factory, for at each he has had to evolve order out of chaos.

While the articles were running in The Aeroplane, letters were constantly coming in from people in all classes, from managers of works who had recently been turned onto aircraft production, from mechanics, from women munition workers of the better class, from draughtsmen, and from school-boys, all anxious to know whether, and if so when, the series would be published in book form. It is now at their disposal, revised in detail, with fresh drawings, and many more of them, by Mr. Geoffrey Watson, one of the most accurate and descriptive of aircraft artists.

The book is bound in cloth and contains 233 pages, and is thoroughly good value for the price, namely, 5s. Copies can be obtained from The Aeroplane and General Publishing Co., Rolls House, Breams Buildings, E.C.4, price 5s. 4d. post free.

A CHANGE OF ADDRESS.

It should be noted that the address of Cellon, Ltd., the proprietors of Cellon Dope, has been changed to 22, Cork Street, London, W.1, and all correspondence should be addressed accordingly.

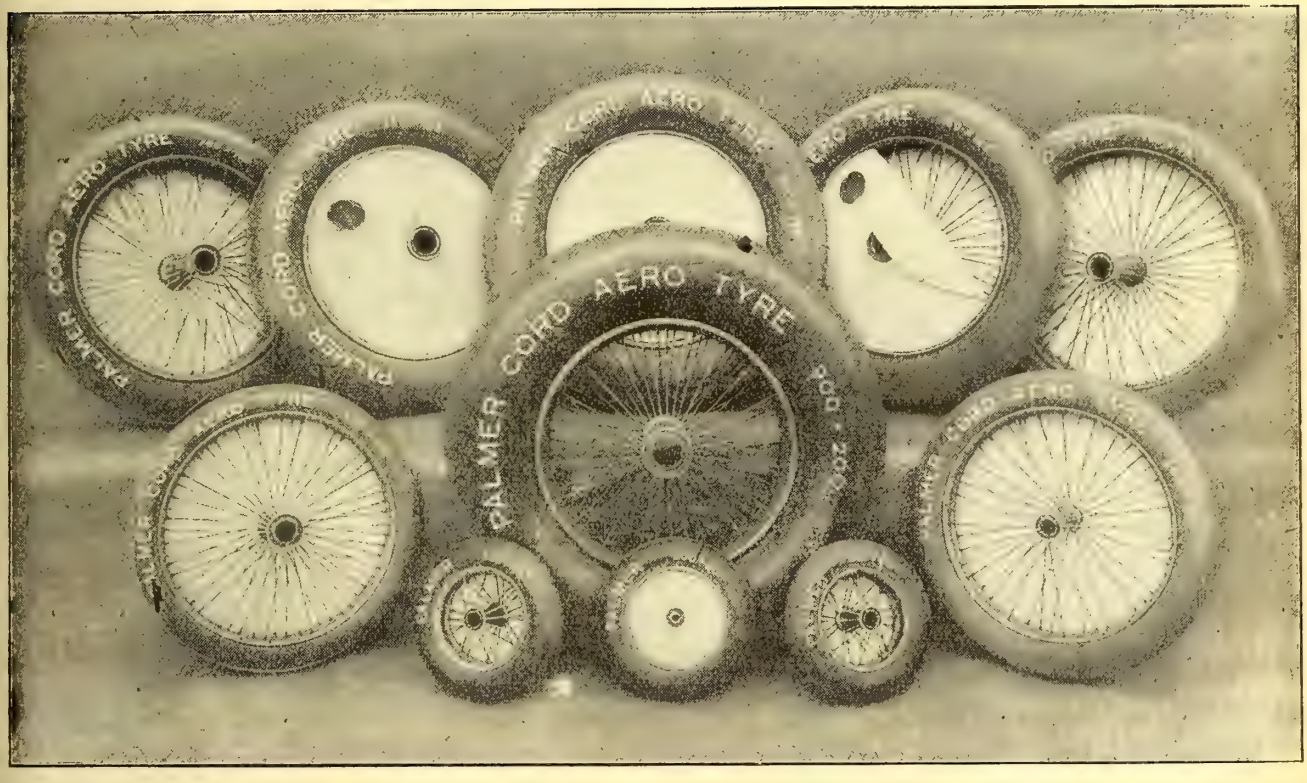
FLAX SUPPLIES.

Over 4,000 applications have been received from City workers in response to the invitation to spend their holidays assisting with the flax harvest, which is of the greatest aircraft importance.

Railway fares to camps in Yorkshire and Lincolnshire, with food and accommodation, will be provided free, and there will be a payment of from 8s. to 10s. a week From the middle of May until the end of August it is estimated that about 10,000 volunteers will be needed.

Applications should be made to Captain Elgee, N.S.R., Salters' Court, St. Swithin's Lane. E.C.

A CHANGE OF ADDRESS.



It should be noted that the registered offices of the Regent Carriage Co., Ltd., aeronautical and automobile engineers, have now been transferred from Graham Street to 126-132, New King's Road, Fulham, S.W.6, and all correspondence should be addressed accordingly.

A VACANCY.

A vacancy exists in the Advertisement Department of The Aeroplane for a capable woman Stenographer, who has had previous experience. Accurate shorthand and type-writing are essential, but a high standard of general education is equally important. Applications should be made by letter only to Mr. J. F. Atkinson, The Aeroplane, 166, Piccadilly, W.1.

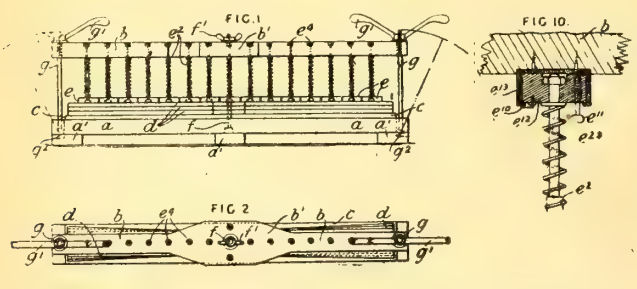
PATENTS INDEX.

The subjoined list of recent inventions has been specially compiled by The Aeroplane, from the current Official Patents Record :—

Patent Applications.

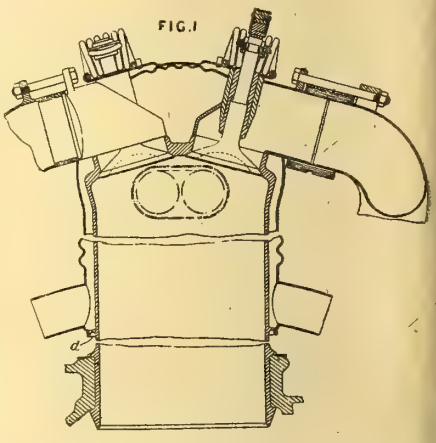
Adams, W. C. Aeroplanes and aircraft. No. 6479. April 17th.
Austin Motor Co. Means for absorbing vibration in the drive between aircraft engine and propeller. No 6647. April 19th.
Avery, F. L. Aeroplanes, etc. No. 6343. April 15th.
Avorio, L. Kite balloons. No. 6379. April 15th.
Avorio, L. Kite balloons. No. 6402. April 15th.
Baker, L. E. Means for indicating height from the ground of aircraft about to land. No. 6440. April 16th.
Bernard, D. H. Bombs. No. 6576. April 18th.
British Aircraft, Ltd. Aeroplanes, seaplanes, etc. No. 6400. April 15th.
Broome, J. H. Clinometers for aircraft, etc. No. 6484. April 17th.
Brown, A. Propeller blades of aircraft, etc. No. 6634. April 19th.
Caproni, G. Construction of aeroplanes. No. 6720. April 20th.
Cook, C. W. Aeroplane fuselages, etc. No. 6590. April 18th.
Cordner, J. Aircraft. No. 6703. April 20th.
Davies, R. L. Gun and projectile for aircraft. No. 6328 April 15th.
Downes, A. J. Determination of probable position of aeroplane, etc., after given interval of time. No. 6480. April 17th.
Downes, A. J. Determination of position and charting of course of airship, etc. No. 6481. April 17th.
Fenston, J. Aircraft. No. 6581. April 18th.
Fraser, F. A. Clinometers for use on aircraft and submarines. No. 6336. April 15th.
Hetherington, H. W. Flying machines. No. 6391. April 15th.
Kemp, J. R. Clinometer for aircraft. No. 6385. April 15th.
Kupec, G. Flying bombs. No. 6488. April 17th.
Leech, A. Aeroplanes. No. 6516. April 17th.
Long, F. C. Method of defence against aircraft. No. 6464. April 16th.
Magrath, W. T. Device for indicating speed of aeroplanes, ships, motor-cars, etc. No. 6557. April 18th.
Malam, J. Aeroplane. No. 6345. April 15th.
Minvalla, P. E. J. Parachutes. No. 6443. April 16th.
Naylor, J. Means for indicating angle of aeroplanes in flight. No. 6559. April 18th.
Page, F. H. Aeroplanes, etc. No. 6684. April 20th.
Power, R. F. Brakes for aircraft. No. 6359. April 15th.
Power, R. F. Brakes for aircraft. No. 6360. April 15th.
Sclater, A. W. Aeroplanes, etc. No. 6620. April 19th.
Verner, J. F. Aeroplane controls. No. 6455. April 16th.
Vickers, Ltd. Mooring of lighter-than-air aircraft. No. 6533. April 17th.
Whetton, S. C. Aeroplane levels or clinometers. No. 6431. April 16th.



Complete Specifications Accepted, prints of which can be obtained on and after May 9th, 1918.

106,092. March 24th, 1916. Fortescue, A. J. Aerial machine of the heavier than air type.
114,724. June 22nd, 1917. Miller, A. R. Level indicator for aeroplanes and the like.
114,798. Oct. 27th, 1917. Soc. Anon. des Etablissements, L. Bleriot. Radiators for explosion engines.

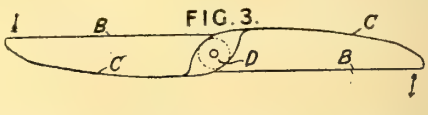
Abridgments of recently published Specifications.



113,354. Cramps; glueing. Hamilton, D. G., 23, Naylor Road, Whetstone, London.

A cramp for use in glueing together laminæ for the manufacture of screw propellers for aircraft and like laminated devices,

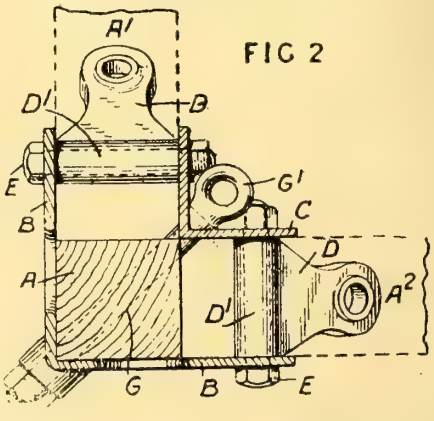
comprises a base and a presser-bar provided with a series of spring pressing-feet for pressing the work down onto the base, and means for depressing the presser-bar. As shown in Figs. 1 and 2, the base *a* is a movable one adapted to rest on a bench, etc., and is provided with feet a^1. The laminations *d* to be glued together are placed on a plate or carrier *c* laid loosely on the base *a*. The presser-bar *b*, which has a central enlargement b^1, carries a series of spring feet *e*, or they might be actual springs, which rest on the work *d*, and pressure is applied by cams or screws, etc., such as rods *g* pivoted at g^2 to the base, and provided with pressure-applying nuts, etc., g^1. An additional pressure bolt *f*, f^1 is shown at the centre of the propeller boss. The pressing-feet *e* are shown carried by rods e^2, the heads of which are in recesses in the undersides of the feet, springs being placed on the rods e^2 as shown. The rods e^2 pass through holes in the bar *b*, and are provided with nuts e^4 on their upper ends. The base *a* may form part of a bench or other fixed structure instead of being separate and movable as shown. The feet *e* are shown in Fig. 2, placed in line along the centre of the bar *b*, and on each side of the central bolt *f*. When it is desired to set off some of the feet *e* from the general line they may be mounted adjustably on the bar *b*. Fig. 10 shows an arrangement in which the rod e^2, e^{2*} carrying the foot is telescopic, and its upper end is fixed in the block e^{12} slidable in a transverse guide e^{13} fixed on the underside of the bar *b*. A pointer e^{10} on the block e^{12} moves over an index on one of the flanges of the guide e^{13}, and a set-screw e^{11} fixes the block when adjusted. In a modification, the telescopic rod e^2, e^{2*} is carried by an arm pivoted on the underside of the bar *b*, an index and fixing screw being provided for adjusting the position of the rod and its foot.



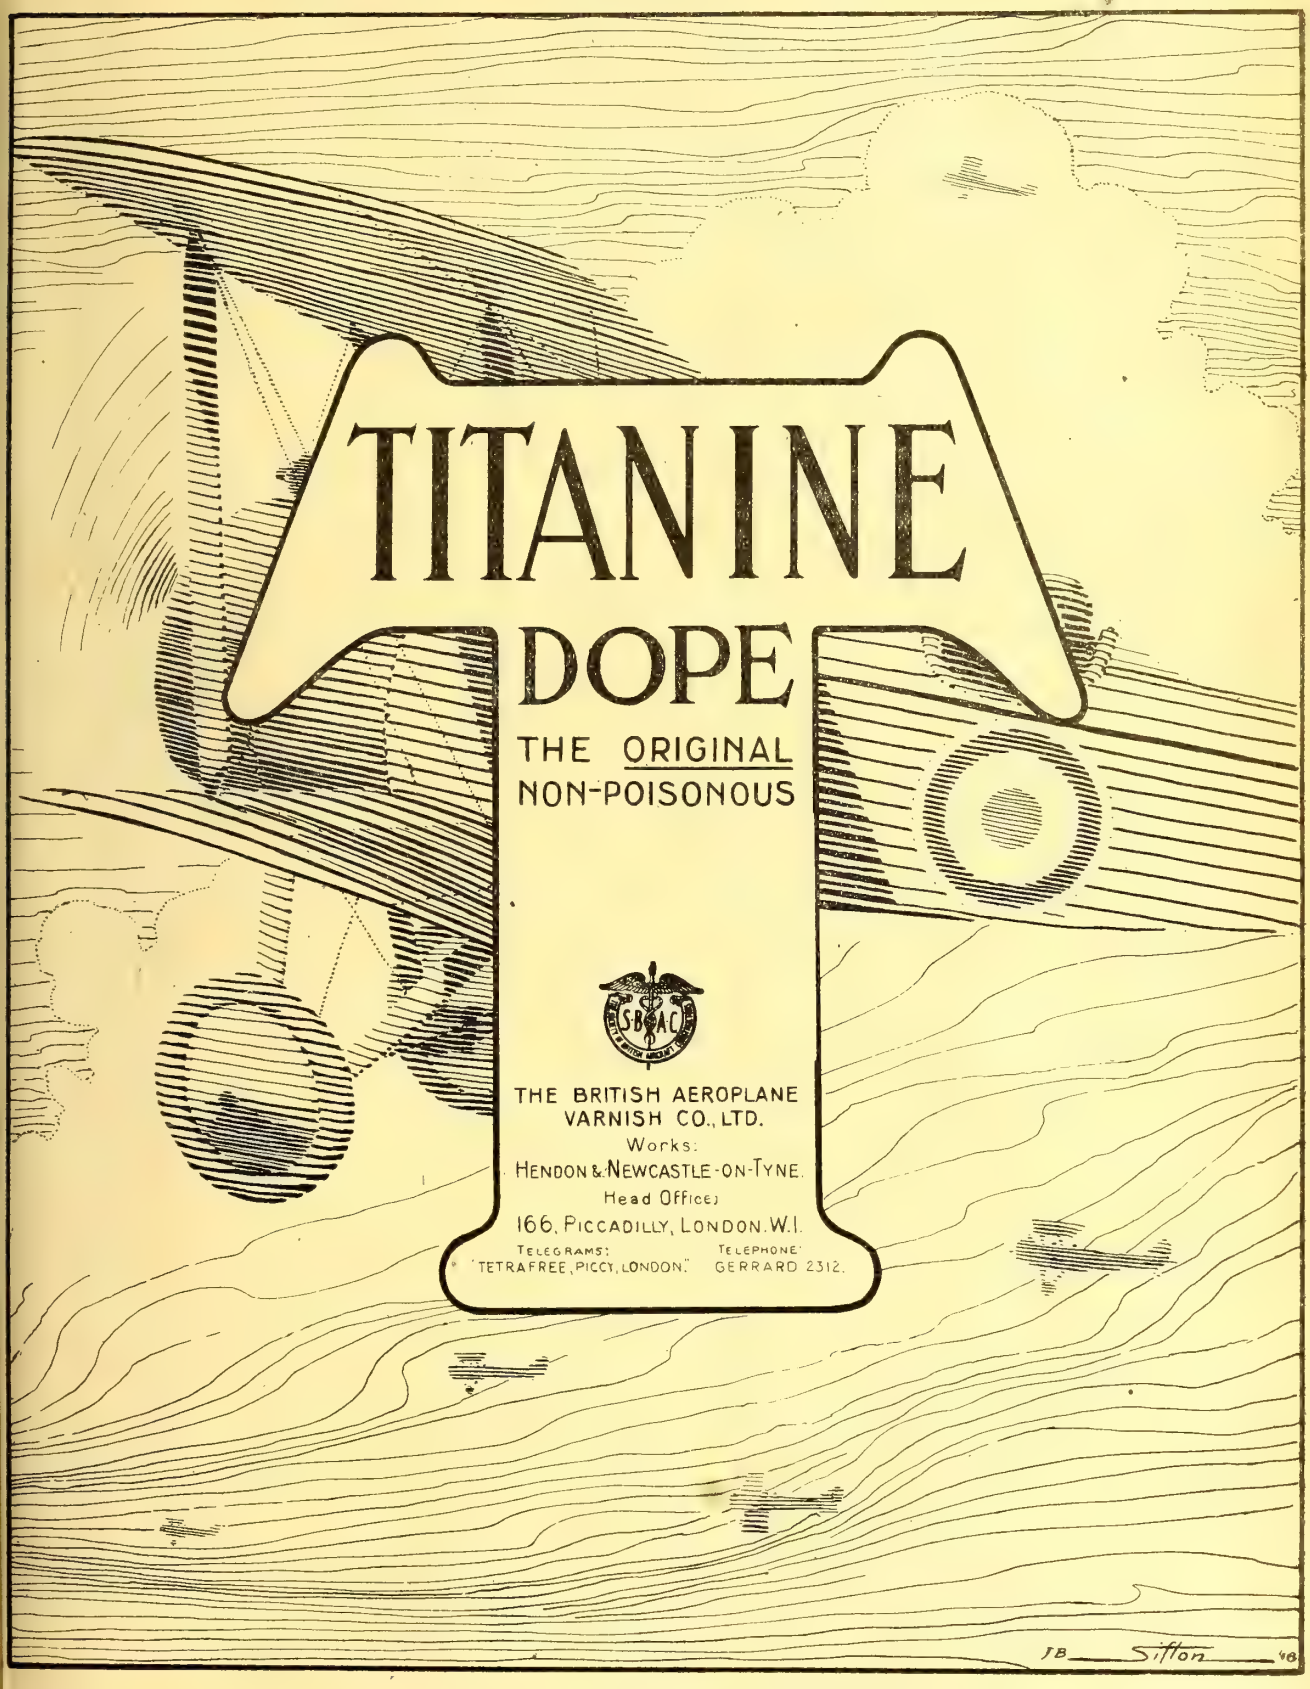
113,406. Internal-combustion Engines. Salmson, E. J. J., 9, Avenue des Moulineaux, Billincourt, France, and Dudbridge Ironworks, Ltd., Stroud, Gloucestershire.

Cylinders, Cooling. — A dome-shaped sheet-steel water jacket is welded to a flange *d* on the cylinder barrel and to the parts on the cylinder head that project through it; it is corrugated between these parts. The jacket is divided on a horizontal plane into two parts which are welded together.

113,463. Aerial Propellers. Nosworthy, W. H., 55, Fenwick Road, East Dulwich, and Prescott, S. J., 45, Church Street, Camberwell, both in London.



An aerial propeller is designed so that its revolution space figure approximates to a rotating knife, which is thin or sharp at the edge or circumference, and which thickens gradually to



the central part or boss D, this boss being of a length equal to the widest part of the blade B C on a line parallel with axis of rotation and of the small diameter required for aerial driving. The blades are joined to the boss along the full range of their greatest width, and may be shaped so that the revolution space figure is bevelled on one or both sides, and may be dished to give a trailing or facing element as desired. Specification 9045/15 is referred to.

113,467. Framework for Aeroplanes, etc. Bolotoff, S. V. de, Kippington Court, Sevenoaks, Kent.

A device for receiving the ends of struts employed in aeroplanes and other structures comprises two angle-plates B, C arranged at diagonally opposite edges of a frame member A, and connected together by pairs of bolts E fitted with distance tubes D^1, struts A^1, A^2 being received between each pair of bolts. The tubes D^1 may be formed with wiring-lugs D, and a diagonal bolt G may be provided, and may carry a wiring-lug G^1. The device may be modified for struts that are not at right angles, and also for struts with tapered ends.

The Curtiss Flying Boat Patents—the Patentee's Claims.

Concerning the Patent Specifications covering certain types of flying-boats owned by Mr. Glenn H. Curtiss, which were reproduced in The Aeroplane last week, he has lodged the following claim regarding the instances where the patents are applicable :—

1. An aeroplane body comprising a main flotation body, the bottom of which is shaped to form hydroplane surfaces, and forwardly located marginal excrescent structures on the sides of said main flotation body, the bottoms of which are co-extensive with and in continuation of the hydroplaning surfaces of said bottom.

2. A hydroplane boat comprising a main flotation body, the bottom of which is shaped to form hydroplaning surfaces, and marginal excrescent structures on the sides of said flotation body, extending longitudinally substantially the full length of said hydroplaning surfaces and having their bottoms in continuation of said hydroplane surfaces.

3. A hydroplane boat for hydro-aeroplanes comprising a main flotation body, the bottom of which is shaped to form hydroplaning surfaces, and forwardly located excrescent flotation structures of triangular cross section on the sides of said main flotation body opposite the resultant centre of aeroplane lift, one side of said section being in continuation of the transverse section of the bottom of the boat, another side parallel to the side of the main body, and the third side extending laterally and downwardly from a point on the side of the boat intermediate the chime and the gunwale.

4. A hydroplane boat body having an interior water-tight space for occupancy by the flying crew or other useful load together with water-tight fin excrescences arranged to flank said space in the vicinity of the bottom of the boat, the excrescences conjointly functioning as planing surfaces and as lateral water-tight compartments protecting said space.

5. A hydroplane boat body having an interior water-tight space for occupancy by the flying crew or other useful load together with water-tight compartments respectively ahead of, aft of, and at each side of said space, the side compartments being in the form of fin excrescences arranged to extend out laterally from the boat-body proper to augment the hydroplaning area thereof.

6. A flying boat adapted to travel upon the surface of the water, rise therefrom and travel through the air, comprising a hydroplaning bottom surface laterally extended beyond the plane of the gunwales of the boat body proper by fin excrescences arranged at opposite sides of said body principally ahead of the centre of gravity of the craft, the corresponding surfaces of said excrescences making a dihedral angle with the vertex thereof in the vertical plane of the keel line of said boat.

7. In a hull for flying-boats, a V-shaped hydroplaning bottom and acutely V-shaped planing fins, each fin having one side formed in the plane of one of the V-sides of the bottom.

8. In a hull for flying-boats, a V-shaped hydroplaning bottom, integral continuations of said bottom forming surfaces projecting beyond the hull and second surfaces projecting from the sides of the hull for intersection with the first said surfaces.

9. A flying-boat including a main flotation body having a hydroplaning bottom, and fine excrescences arranged to augment said bottom laterally in the vicinity of the resultant centre of hydroplane lift as determined through hydroplaning action on the surface of the water and preparatory to flight.

10. In a hull for flying-boats, a V-shaped hydroplaning bottom and auxiliary planing fins formed as lateral extensions of said bottom, said fins being enlarged rearwardly from the bow of the hull in directions providing longitudinal and transverse streamlines.

11. In a flying-boat, a hull rounding off rearwardly from its bow to provide a hydroplaning bottom and rounding off oppositely to provide a cabin situated over said bottom, and a fore deck for the hull intersecting the generating hull lines for the cabin.

12. A hull for flying-boats enlarging rearwardly along rounded, upper and lower longitudinal hull lines, a hydroplaning bottom for the hull merging into the lower hull lines, and a deck intersecting the upper hull lines for provision of a cabin over said bottom.

13. In a flying-boat, a hull, a cabin having streamlines merging integrally into the hull in one direction and a conning-top rounding off the streamlines of the cabin in the other direction.

14. A hull for flying-boats having its elevational aspect determined by lines rounding off rearwardly both upwardly and downwardly from the nose of the hull, and a deck intersecting the said upper boat line and cutting down the hull to provide a cabin.

15. In a hydroplane hull, an overhanging bow having an elevational aspect determined by lines rounding off rearwardly and downwardly, a bottom V-shaped in cross section, the angled portions of the bottom having their inception at the bow and considerably above the water-line, each portion being decreasingly concaved from the nose rearwardly and the angle between the portions rearwardly, approaching a maximum obtuseness, and a step terminating said bottom.

16. In a hydroplane hull, a fore-body, a tail, a planing step dividing the bottom of the fore-body from the tail bottom, an upper surface for the tail enlarging forwardly in a reverse curve over said step and a cabin roof provided over the fore-body in advance of said step and merging into said enlarging tail surface.

17. In a hydroplane hull, a fore-body, a tail, a planing step dividing the bottom of the fore-body from the tail bottom, an upper surface for the tail enlarging forwardly in a reverse curve over said step to form a cabin roof for the fore-body and a deck intersecting said fore-body at a distance below said roof and destroying a normal merging of the roof line into the nose of the hull.

18. In a hydroplane hull, a fore-body, a tail, a cabin provided for said fore-body and having a roof merging rearwardly into said tail and forwardly into the nose of the hull, a deck intersecting the cabin and a cockpit provided at the intersection of said cabin and deck.

19. A flying-boat including a flotation body having an underneath hydroplaning surface of a size in cross section designed to extend out on either side beyond the boat-body proper approximately opposite the centre of hydroplane lift, the bottom surfaces of the laterally extended portions making a dihedral angle with the vertex of the angle in the vertical plane of the keel line of the boat.

20. A flying-boat including a main flotation body having an underneath hydroplaning surface of substantially V-form in transverse section, fin excrescences arranged to augment the hydroplaning surface laterally in the vicinity of the resultant centre of hydroplane lift, the bottom surfaces of the fins continuing uninterruptedly the hydroplaning bottom of the boat-body proper.

21. A flying-boat including a main flotation body, a hydroplaning under surface, and lateral extensions of a construction designed to conform longitudinally to said hydroplaning under surface and to extend substantially the full length thereof.

22. In a hydro-aeroplane boat-body, a bottom, longitudinally convexed, and auxiliary planing surfaces formed as lateral extensions of said bottom in the vicinity of the resultant centre of hydroplane lift, said centre lying considerably in advance of the point of maximum convexity, and sufficiently distant therefrom to provide for its movement rearwardly to a point in the vicinity of said point of maximum convexity upon fore and aft oscillation of the boat.

23. In a hydro-aeroplane boat-body, a bottom longitudinally convexed, aeroplane wings extending intermediately across said body, the point of maximum convexity underlying said wings, auxiliary planing surfaces formed as lateral extensions of said bottom, said surfaces commencing in advance of the resultant centre of hydroplane lift and terminating rearwardly in the vicinity of said point of maximum convexity.

24. In a flying-boat, a main flotation body, a hydroplaning under surface, fin excrescences co-extensive with the hydroplaning surface, each fin extending forwardly beyond a line in the vertical plane of the resultant centre of hydroplane lift a greater distance than to the rear thereof.

25. A flying-boat including a forward hydroplaning bottom designed to extend from end to end uninterruptedly and at an angle laterally beyond the sides of the boat-body proper to materially increase the hydroplaning surface and enable the boat to come rapidly to its hydroplaning position upon the surface of the water and to rise from that position into the air.

26. In a hydroplane boat, a bottom longitudinally convexed, and auxiliary planing surfaces formed as lateral extensions of said bottom to extend substantially to the full length of that portion of said bottom ahead of a point determining the maximum convexity thereof.

27. In hydro-aeroplane flotation body, a longitudinally convexed bottom in which that portion of said bottom in advance of the point of maximum convexity is of hydroplaning form, fin excrescences arranged to augment said bottom laterally in the vicinity of the resultant centre of hydroplane lift, aeroplane wings, the centre of pressure on said wings being disposed in the approximate transverse vertical plane of said point of maximum convexity, and said point determining the rearward terminus of said fins and the rearmost point to which the centre of hydroplane lift may be shifted as the body in its entirety is oscillated fore and aft.

THE FLAX MARKET.

Details of flax supplies given by Mr. Kellaway in a written reply to Mr. Kelly show that all the markets last year were in Ireland. Flax markets were held in 25 towns up to March 31st, 1918, for the 1917 crop. The total flax bought in all markets was 11,934 tons, at a total cost of £2,717,981. The average price per stone was 28s. 6d.

THE AIRCRAFT TRADER

MARKET TOPICS.

(Prices are for quantities on usual terms.)

April 25th, 1918.

)PPER.—Although the output is reaching a colossal figure, is very little metal available for ordinary commercial purs; the U.S. Government and the other Allied Governments ıg practically all that is produced.

ıe agitation amongst certain producers for an advance in official price seems to have come to an abrupt end, and it s as though some ulterior motive was behind the complaints h were made.

Standard Cash	£110 per ton.
Electrolytic	£125 to £121
B.S.	£123 to £119

N.—The two main factors which continue to keep this :et in an unsettled condition are: The Shipping position and ıigh level of prices in the East. In consequence of the high s which are being paid in the East, the prices here have ne very much inflated, the price of Standard Tin having ad- d £11 per ton in a week. Sellers are, of course, very e, and it is impossible to buy forward Tin.

e whole situation is very complex, and unless some drastic n is taken, there does not appear to be much hope of im- ement. The demand in U.S.A. is very large indeed; but, tunately, adequate supplies are not being received, and the tion there is causing much anxiety.

ere is, apparently, plenty of Tin here, but, owing to the ulty of replacing stocks, except at the inflated prices ruling e East, sellers are reluctant to offer.

Prices.

Standard Cash	£333 0 0 per ton.
Straits	£333 10 0 per ton.
English	£341 0 0 per ton.
Eastern	£343 0 0 per ton.

AD.—Supplies of Lead for work of national importance are ery difficult to obtain, and prices remain unchanged.

EEL.—Supplies of Steel are not very difficult to procure, he output is most favourable. The demands for ships, tanks, ıeroplanes are, of course, increasing. There does not, how- appear to be any fear of a shortage of Steel.

ces remain unchanged.

MBER.—The position is still most serious, and the situation ing keenly, but anxiously, watched. It is rumoured that ructors have been notified that the use of ———, which is nly Silver Spruce substitute available, has been forbidden for where stress is required. In other words, the quantity ı may be used is infinitesimal; it is also rumoured that er unsatisfactory timber may be supplied for aeroplane . It is to be hoped that this rumour is without foundation.

velopments are eagerly awaited.

pplies of Mahogany and Walnut are fairly well maintained, prices are very firm.

BRIC.—It is stated that the Air Ministry has the Fabric ion well in hand, and there is no fear of a shortage of ies. The present state of affairs in Ireland cannot, however, nored, and steps should be taken to provide against unfore- contingencies.

MACHINE TOOLS.

pursuance of the instructions of the Controller of Machine , dated February 19th, 1918, Reference H.H.B./G.S., the taking to be signed by, or on behalf of, dealers in eers' and machinists' imported small tools is now cancelled. Ministry of Munitions has, however, imposed the following ations with regard to priority classification in respect of all tools, whether imported or of British manufacture:—

firm or person is permitted to issue a class "A" cate with an order for small tools unless—

a) Such small tools form a component part of a direct ernment contract, or

b) Specially authorised in writing to do so by the Priority partment of the Ministry of Munitions. Any applications such higher priority must be made through the Director Small Tools, Charing Cross Buildings, Embankment, W.C.2.

class "A" certificate issued must bear the contract er in the case of (a) and the priority permit number and fication in the case of (b). Firms holding a P.5. maintenance permit are authorised to quote their maintenance permit number and priority classification on orders for small tools up to the value allowed under the terms of their maintenance permit. All other firms and persons placing orders for small tools required for the upkeep of existing industrial plant should issue a class "B" certificate with their order. Orders for small tools without certificates may only be accepted when such orders can be executed from stock and without prejudice to orders received with classification certificates as above.

The above regulations do not permit the issue of a class "A" certificate for small tools, which are required for the manufacture of goods ordered on a direct Government contract, e.g., a firm having a direct contract from the Ministry of Munitions for the manufacture of guns may issue a class "A" certificate bearing the appropriate priority classification attached to the contract for any of the material used in the manufacture of guns, but such a firm can only issue a class "B" certificate for the small tools to be used in the manufacture of guns.

TO ECONOMISE DRILLS.

The loss of time and money involved in all engineering by the breakage of drills occasioned by a long length of drill projecting from the chuck is well known to those concerned with aircraft production. An ingenious device has been produced under patent by the Central Drill Protector Company, which overcomes this difficulty in a very practical fashion.

It can be supplied for drills ranging in size from 1-10th by 64ths up to ¼-inch, and also in millimetres. Inquiries should be addressed to the Central Drill Protector Company, Halton House, 21-23, Holborn, E.C.1.

A CHANGE OF ADDRESS.

It should be noted that the offices of the British Petroleum Co., Ltd., at 117-123, Great Portland Street, London, W.1, have been commandeered by the Government, and the London Branch (Town, Northern and Southern Divisions) has at very short notice been removed to—4, 5, 6 and 7, Chiswell Street, Finsbury, London, E.C.1.

A TABLE OF TURNBUCKLES.

Mann, Egerton and Co., Ltd., of 177, Cleveland Street, London, W.1, who have for a considerable time taken an active interest in aircraft production, have issued an interesting table setting forth the specification of various types of A.G.S. turnbuckles and sizes of other types.

A copy of this table has been forwarded to many aircraft constructors in the country, but any firm which has not received a copy is requested to apply for one at the above address. The table is useful as it shows clearly substitute turnbuckles which can be used alternatively.

AMERICAN TIMBER CONTROL.

Competition between large concerns seeking to supply the U.S. Government with aircraft spruce has been eliminated by an agreement reached by representatives of the companies and the Spruce Production division of the Signal Corps.

The Aeroplane Spruce & Lumber Co., of Hoquiam, has been assigned to Grays Harbour Country.

The Warren Spruce Co., of Portland, has been assigned to the Siletz basin and the Alsea bay district and a portion of Grays Harbour Country.

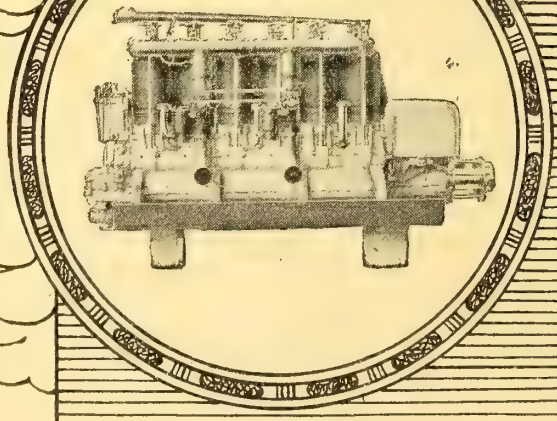
The Grant-Smith-Porter Brothers Co., of Portland, has been assigned the Southern portion of Pacific Country and unassigned portions of Oregon.

A HANDLEY PAGE FUNCTION.

A highly successful evening was held on Saturday, April 20th, at St. Peter's Hall, Cricklewood Lane, by the "Handley Page" Branch of the National Federation of Discharged and Demobilised Sailors and Soldiers which held a concert and dance.

The hall was tastefully decorated and great appreciation was shown in the way the programme was arranged by Mr. F. Lee, a discharged soldier himself.

It would be very hard to say which artiste excelled, and had it not been for the lighting regulations it would have been midnight before the entertainment finished.



During the interval the Secretary (Mr. H. Brain) thanked everybody who helped on behalf of the branch, and also gave a few words of advice on the position of soldiers' dependants in regards to pensions, etc.

C.D.C.

(*Continued from page 1599A*).

Temp. Sec. Lt. C. F. Nathan, Gen. List and R.F.C.

As observer, when information was urgently required during an attack, and several attempts to obtain it had been unsuccessful owing to exceptionally bad weather conditions, he went out with his pilot and succeeded in gaining the necessary information, flying at a height of about 50 ft. under heavy rifle and machine-gun fire. He had already made a flight under similar conditions on the same day. He showed great courage and determination.

Lt. E. T. Owles, R. Ir. Fus., Spec. Res. and R.F.C.

He made a successful wire reconnaissance along a corps front at a height of 300 ft. to 800 ft. under heavy machine-gun and rifle fire. On another occasion while on a reconnoitring patrol he had four encounters with enemy aeroplanes, in one of which he was attacked at 800 ft. by five enemy scouts. By his clever manœuvring the enemy machines were driven off, and he completed a valuable reconnaissance. He showed the greatest keenness and determination at his work.

Temp. Lt. (temp. Capt.) A. H. Peck, Gen. List and R.F.C.

He engaged single-handed three enemy aeroplanes, though they had superior height. He drove them back over their lines, and prevented them from carrying out their reconnaissance.

Lt. S. L. Quine, Ches. R., Spec. Res. and R.F.C.

He went out in exceptionally rough and stormy weather during an attack, and, flying very low over the enemy's batteries, reported and located those which were in action. By his courageous and determined efforts he assisted materially in clearing up the situation, and enabled effective fire to be brought to bear on the enemy's batteries.

Temp. Sec. Lt. K. G. Sclanders, Gen. List and R.F.C.

He carried out two most important photographic reconnaissances of the enemy's position under intense anti-aircraft fire.

Temp. Sec. Lt. D. H. Sessions, Gen. List and R.F.C.

During two months he did 111 hours' flying on artillery work, often under heavy anti-aircraft fire. He constantly observed most successfully for the artillery, causing direct hits on gun pits, fires, and explosions.

* Capt. W. Smith, Lond. R. and R.F.C.

For conspicuous gallantry and devotion to duty in 32 long-distance bomb raids, many of which were carried out under very unfavourable weather and conditions.

* The name marked thus appeared in the "Gazette" dated Oct. 27th, 1917.

Temp. Lt. (temp. Capt.) J. B. Solomon, Ox. and Bucks L.I. and R.F.C.

He carried out a patrol lasting nearly three hours in a very high wind and low clouds, flying at an average height of 500ft. and brought back a valuable report. During this flight he attacked and drove down an enemy two-seater machine under heavy rifle and machine-gun fire from the ground. He also made a valuable reconnaissance in very bad weather, flying at an average height of 100 ft. under heavy rifle and machine-gun fire, in the course of which he engaged a hostile battery with his machine-gun. He set a splendid example of courage and determination.

Temp. Lt. A. J. Tyler, Gen. List and R.F.C.

He took an active part in several engagements. He went up in all weathers and located many enemy batteries. He showed splendid determination and resource when under heavy fire.

Sec. Lt. (temp. Lt.) L. B. Williams, Gen. List and R.F.C.

During an attack with machine-guns and bombs on enemy infantry he displayed great courage and endurance in spite of very adverse weather conditions, which caused the machines to become separated in the fog. Observing a hostile battery in action he released bombs on it, one of which was observed to be a direct hit. Afterwards, whilst continuing his attacks on the enemy front trenches, his main plane was blown away, and his machine crashed to earth in the open. Being wounded, he lay there unable to move, but was eventually rescued. This officer has always shown himself full of zeal, determination, and courage.

Lt. J. H. G. Womersley, R.G.A. and R.F.C.

In aerial fighting he brought down four enemy machines and forced others to land. He also carried out reconnaissances at a low altitude.

Australian Imperial Force.

Capt. and Flt. Comdr. S. I. Winter-Irving, F.C.

When acting as escort during a reconnaissance he repeatedly attacked and drove off single-handed a formation of three enemy aeroplanes, thereby enabling a most valuable reconnaissance to be made.

* * *

The King has been pleased to approve of the award of the Military Medal for bravery in the Field to the following Non-commissioned Officers and Man :—

1429 Serjt. E. J. Elton, R.F.C (Wimborne).

4909 1st Cl. Air Mech. S. L. Bennington, R.F.C. (Tottenham, Midd'x.)

14374 Serjt. H. W. Scarnell, R.F.C. (Hertford).

Admiralty, April 26th.

The following officer and man have been mentioned in dispatches for services in action with enemy submarines :—

Flt. Lt. C. S. Hay, R.N.A.S.

Actg. Air Mech., 1st Cl., G. W. Ewbank, O.N. F16420.

* * *

The King has been pleased to approve of the award of the following honours and medals to the following officers and men :—

Evacuation of Thermi Aerodrome.

The Distinguished Service Order.

Comdr. G. C. Chichester, R.N.—In recognition of the energy, good judgment, and coolness under fire with which he organised and executed the evacuation of the Aerodrome at Thermi Mityleni, on October 9th to 15th, 1917. The evacuation of the aerodrome was carried out under continuous bombardment by the enemy, and was effected entirely without casualties and without loss of stores.

The Distinguished Service Medal.

A.B. G. A. Chapman, O.N. 218967 (Ch.); Ldg. Sto. E. Chivers, O.N. K 5051 (Ch.); P.O. D. Keen, O.N. 190743 (Ch.); A.B. J. T. Timlin, O.N. 238582 (Dev.)

Mentions in Dispatches.

The following officer and men have been mentioned in dispatches :—

Actg. Gnr. (T.) (now Actg. Mate) H. Pursey, R.N.; Pte. J. M. Ryan, R.M.L.I., No. Po./19256; C.P.O. J. K. W. Tadd, O.N. 138185 (R.F.R., Dev./A3129).

* * *

The King has been pleased to approve of the award of the following honours, decorations, and medals to officers and men of the Royal Naval Air Service in recognition of their services at Dunkirk :—

The Distinguished Service Order.

Wing Capt. R. H. Clark-Hall, R.N.; Wing Comdr. H. M. Cave-Brown-Cave, R.N.; Sqdn. Comdr. R. S. Dallas, D.S.C., R.N.A.S.

A Bar to the Distinguished Service Order.

Wing Comdr. R. H. Mulock, D.S.O., R.N.A.S.

The Distinguished Service Cross.

Sqdn. Comdr. C. Draper, R.N.A.S.; Sqdn. Comdr. A. R. Arnold, R.N.A.S.; Sqdn. Comdr. W. L. Welsh, R.N.A.S.; Flt. Lt. (Actg. Flt. Comdr.) F. E. Banbury, R.N.A.S.

The Distinguished Service Medal.

C.P.O. G. E. Barrett, O.N. F 656; Ldg. Mech. (E.) E. H. Beesley, O.N. F 10447; C.P.O., 3rd Gr., F. A. Benfield, O.N. M 1722 (Po.); P.O. (E.) R. A. Clarke, O.N. F 3896; C.P.O. (E.) E. Dessaussois, O.N. F 1663; C.P.O. (E.) H. Gott, O.N. 271902 (Ch.); C.P.O. (E.) J. V. Grieve, O.N. F 263; C.P.O. (E.) W. A. Hill, O.N. F 4596; Air Mech., 2nd Gr. (G.) J. D. R. Innes, O.N. F 8687; C.P.O., 3rd Gr. (R./H.) T. S. Jobling, O.N. F 249; C.P.O. (E.) W. L. Johnson, O.N. F 4529; C.P.O., 3rd Gr. (W.), A. E. Le Sueur, O.N. F 3413; C.P.O. (E), H. Mann, O.N. F 485; P.O. (R./H.), E. W. Mayes, O.N. F 3507; C.P.O., 3rd Gr. (E.), F. Moore, O.N. F 1637; 3rd Writer R. A. Pennington, O.N. M 16116 (Po.); 3rd Writer W. Quaye, O.N. M 20159 (Ch.); P.O. (R.H.) C. E. Roust, O.N. F 3903; P.O. (R./H.) C. O. Towler, O.N. 237507 (Po.).

Mentions in Dispatches.

The following officers and men have been mentioned in dispatches :—

Flt. Payr. F. R. Waymouth, R.N.; Lt.-Comdr. R. Bull, R.N.V.R.; Sqdn.-Comdr. W. Wright, R.N.A.S.; Lt. A. S. Cheshire, R.N.V.R.; Lt. W. D. Wain, R.N.V.R.; Hon. Dental Surg. H. J. Corin, R.N.V.R.; P.O. (W./T.) H. Aves, O.N. F 422; C.P.O. (R./H.) P. Coyle, O.N. 218288 (Ch.); P.O. (E.) H. Dawson, O.N. F 4755; C.P.O. (E.) W. Griffiths, O.N. F 8339; P.O. (W.) E. C. Hooper, O.N. F 5113; P.O. Mech. A. E. Humphrey, O.N. F 2348; Ldg. Mech. (C.) R. F. Manders, O.N. F 11078; Ldg. Mech. (E.) F. R. Maskell, O.N. F 8; C.P.O., 3rd Gr. (E.) L. G. Miles, O.N. F 1149; P.O. (C.) J. M. Mitchell, O.N. F 3689; P.O. (E.) H. W. Newill, O.N. F 2272; P.O. (E.) V. S. Parker, O.N. F 2220; P.O. (C.) R. W. Petch, O.N. F 9289; C.P.O., 3rd Gr. (E.), W. C. Reeves, O.N. F 3123; C.P.O., 3rd Gr. (E.) A. Smith, O.N. F 1594; C.P.O., 3rd Gr. (E.), J. R. Strathan, O.N. F 2461; P.O. (C.) E. Strain, O.N. F 2101; C.P.O., 1st Gr. (E.), R. Tuck, O.N. 271357 (Po.).

Miscellaneous.

The Distinguished Service Order.

Flt. Comdr. F. T. Digby, D.S.C., R.N.A.S.

For the consistent determination, gallantry, and skill displayed by him in long-distance bombing raids, particularly on the night of March 24th-25th 1918. On that date, in spite

of mist, which made the journey most difficult, he eventually reached his objective, which he bombed with good results.

THE DISTINGUISHED SERVICE CROSS.

Sqdn. Comdr. A. B. GASKELL, R.N.A.S.

In recognition of his services on the occasion of the evacuation of the Thermi aerodrome on October 9th to 15th, 1917, under continuous bombardment by the enemy.

Flt. Lt. (Actg. Flt. Comdr.) L. H. ROCHFORD, R.N.A.S.

For the consistent determination, bravery, and skill as a fighting pilot and flight commander. He has destroyed and driven out of control many enemy machines.

Flt. Lt. J. A. GLEN, R.N.A.S.

For exceptional gallantry and skill as a fighting pilot and flight leader. On July 7th, 1917, he attacked two seaplanes off Ostend. In conjunction with other pilots he shot down one which crashed into the sea. The second he attacked himself, and after a short combat it also crashed into the sea, sinking immediately. He has destroyed and driven down out of control many enemy machines.

Flt. Lt. A. T. WHEALY, R.N.A.S.

For the most consistent determination, bravery and skill with which he has carried out numerous low-flying harassing attacks on the enemy's troops, transports, etc., inflicting heavy casualties and damage. By his splendid example and gallantry a great many hostile operations were hampered and frustrated. He has further brought down many enemy machines.

Flt. Lt. A. B. ELLWOOD, R.N.A.S.

For the determination and skill displayed by him as a pilot. On March 10th, 1918, he attacked three Albatros scouts. He drove two of the enemy aircraft down, and then dived on the third and fired a long burst. The enemy machine pulled up, fell over on its side, and fell straight down out of control until lost to sight. He has also destroyed or brought down out of control many other enemy machines.

A BAR TO THE DISTINGUISHED SERVICE CROSS.

Flt. Lt. S. M. KINKEAD, D.S.C., R.N.A.S.

For the skill and courage displayed by him as a pilot. On March 22nd, 1918, he attacked and drove down out of control an Albatros scout which was attacking a French machine. He has brought down many other enemy machines. He is an exceptionally good pilot, and a clever and plucky fighter, and has performed very fine work, both on offensive patrols and on low-flying missions.

Flt. Lt. E. DICKSON, D.S.C., R.N.A.S.

For conspicuous gallantry in attacking enemy aircraft, and in carrying out bombing raids. On March 16th, 1918, he went to the assistance of a machine of his formation which was being attacked at close quarters by 12 enemy scouts. Despite the fact that all the guns on his machine were useless, owing to lack of ammunition, he turned and charged the hostile formation, splitting it up and diverting their attention from the other machine, thus undoubtedly saving it. On other occasions he has brought down enemy machines and taken part in many daylight bombing raids, at all times showing utter fearlessness and great determination.

Obsr. Lt. C. CHAPMAN, D.S.C., R.N.A.S.

In recognition of his services on March 21st, 1918, when he carried out successful spotting for the bombardment of Ostend. On other occasions he has carried out valuable reconnaissances for the Fleet.

THE CONSPICUOUS GALLANTRY MEDAL.

Ldg. Mech. (E.) S. F. ANDERSON, D.S.M., O.N., F.12676.

For conspicuous gallantry, initiative, and courage displayed by him on March 19th, 1918, when the petrol system of his machine sustained extensive damage in action with enemy aircraft. After repairing the damage to the petrol system he noticed that the starboard engine was boiling violently. After reporting to the officer in charge and requesting that the engine should be throttled down as far as possible, he climbed out on the lower plane, and effected extensive repairs to the water circulation system, and thus enabled the engine to be opened out to the desired number of revolutions. Ldg. Mech. Anderson's work, which was carried out entirely in the open in a wind force of 90 miles per hour, and occupied 1¾ hour, undoubtedly saved the machine.

A BAR TO THE DISTINGUISHED SERVICE MEDAL.

Air Mech., 1st Gr., P. J. ADKINS, O.N. F.2763.

MENTIONS IN DISPATCHES.

The following Officer and Men have been mentioned in dispatches :—

Warrt. Officer, 2nd Gr., A. H. Mitchell, R.N.A.S.; Ldg. Mech. A. Copp, O.N. F.560; P.O. (R./H.) A. Parish, O.N. F.9288.

* * *

The following Decorations have been conferred by the Allied Powers on Officers and Men of the British Naval Forces for distinguished services rendered during the war. The King has given unrestricted permission to the Officers and Men concerned to wear the Decorations in question :—

CONFERRED BY THE KING OF THE HELLENES.

ORDER OF THE REDEEMER.

OFFICER.

Maj. (temp. Lt.-Col.) A. C. BARNBY, R.M.L.I., Sqdn. Comdr., R.N.A.S.

CHEVALIER.

Flt. Lt. S. H. GASKELL, R.N.A.S.

Actg. Flt. Comdr. C. GILMOUR, R.N.A.S.

MEDAL FOR MILITARY MERIT.

Warrt. Officer, 2nd Gr., A. H. MITCHELL, R.N.A.S.

Air Mech., 1st Gr., W. S. STEVENS, O.N. F.8986.

WAR OFFICE, April 26th.

REGULAR FORCES—ESTABLISHMENTS—R.F.C.—MIL. WING.—Equipt. Officer, 1st Cl.—Temp. Lt. C. M. Dyer, Gen. List, and to be temp. Capt. while so empld., Feb. 10th.

INFANTRY.—E. Surr. R.—Temp. Capt. R. J. Sanceau, from R.F.C., July 5th, 1915. S. Staff. R.—Temp. Capt. H. T. Hanmer, from R.F.C., Jan. 19th, 1916.

* * *

The King has been pleased to award the Albert Medal in recognition of gallantry displayed in endeavouring to save life :—

Flt. Serjt. ALBERT E. WARNE, 24th Wing Aeroplane Repair Section and Flt. Serjt. HORACE CANNON, No. 50 Training Squadron.

On January 26th last, while flying in England, a pilot, when attempting to land, lost control of his machine, which crashed to the ground from a height of about 150 feet and burst into flames. Flt. Serjts. Warne and Cannon went to the rescue of the pilot at great personal risk, as one tank of petrol blew up and another was on fire; moreover, the machine was equipped with a belt of live cartridges which they dragged out of the flames. They managed to extricate the pilot, who was strapped to the burning plane, but he died shortly afterwards from his injuries and burns.

AIR MINISTRY, April 26th.

R.A.F.—The following temporary appointments are made at the Air Ministry :—

STAFF OFFICER, 2ND CLASS.

Capt. Hon. O. M. Guest, and to be temp. Maj. while so empld., April 18th.

Capt. H. French, and to be temp. Maj. while so empld., April 23rd.

Col. J. D. Edwards, C.B., to be temp. Brig. Gen. while empld. at the Air Ministry, April 1st.

FLYING BRANCH.

To be temp. Lt.-Cols. while empld. as Lt.-Cols. (Flying) :—Maj. S. Smith, D.S.O., Capt. (temp. Maj.) K. R. van Der Spuy, M.C., April 17th; Maj. E. M. Murray, M.C. (seny. April 17th). Maj. E. H. M. O'Farrell (seny. April 17th), April 19th.

Capt. (temp. Maj.) E. L. Millar to retain his rank while empld. as Maj. (Flying), April 6th.

Lt. (temp. Capt.) S. G. Kingsley, M.C., to be temp. Maj. while empld. as Maj. (Flying), April 20th.

Lt. G. G. Crutchley to be temp. Capt. while specially empld., April 27th.

To be Obsr. Officers :—Temp. Sec. Lt. D. L. Brocklesby, April 2nd; Temp. Sec. Lt. J. M. Dunn, Temp. Sec. Lt. J. A. Ellis, Temp. Sec. Lt. A. K. Mackereth, April 4th.

Lt. R. V. Waters relinquishes his commn. on account of ill-health contracted on active service, April 27th.

ADMINISTRATIVE BRANCH.

Capt. G. Stevens to be temp. Maj. while empld. as Admin. Maj., April 18th.

Sec. Lt. and Hon. Capt. C. S. Burdon to be temp. Capt. while empld. as Admin. Capt., April 1st.

H. G. Stuart, M.C. (Sec. Lt. in Army), is granted a temp. commn. as Lt., April 27th.

The following are granted temp. commns. as Lts. :—G. F. Ansell, W. H. Lyall, April 1st.

The following are granted temp. commns. as Sec. Lts. :—F. T. L. Avis, S. E. Baile, F. C. Bird, E. G. Boone, W. G. Chate, R. St. G. Chester-Master, J. P. A. Donaghy, A. Edwards, H. C. F. Ellis, C. Freeman, P. W. Gibbs, F. W. Healey, L. J. Marden, E. G. Masson, B. A. Matthews, C. C. Moldram, N. O'Reilly, W. B. T. O'Sullivan, W. E. Randall, J. L. Saxton, J. R. Senior, W. F. Swan, J. B. West, M. J. Wolseley, Cpl. C. W. Braddy (from R.A.F.), Flt. Serjt. J. Freeman-Fowler (from R.A.F.), H. D. Fletcher, Serjt. G. J. Mackie (from R.A.F.), April 1st; W. S. Sholl, 1st Writer R. S. Davidson (from R.N.D.), April 3rd; 2nd Cl. Air Mech. A. J. Williamson (from R.A.F.), April 4th; J. Bremner, H. G. Brodie, L. N. Bubier, H. Byatt, F. G. Cartman, C. W. Curtis, C. L. Hales, F. C. Hook, W. H. Jones, G. Mitchell, R. Myer, E. C. St. A. Newby, H. Nixon, E. U. Poyser, W. Roxburgh, H. N. Sauer, W. H. E. Thomas, R. N. Walter, H. A. Young, April 5th; Cdt. (Pte.) S. W. Turner (from Dorset R.), Cdt. G. Hill (from Can. Rly. Troops), T. Hodgson, April 6th.

Capt. (temp. Lt.-Col.) G. W. Williamson, M.C., relinquishes the temp. rank of Lt.-Col. on ceasing to be empld. with the Ministry of Munitions, April 5th.

Sec. Lt. H. T. Kingsley to relinquish his commn. on account of ill-health contracted on active service, April 27th.

TECHNICAL BRANCH.

Capt. A. Graves to be temp. Maj. while empld. as Maj. (Tech.), April 6th.

Temp. Sec. Lt. H. C. Atkin to be temp. Sec. Lt. (Tech.), April 1st.

WAR OFFICE, April 27th.

REGULAR FORCES—ESTABLISHMENTS—R.F.C.—MIL. WING.—Flt. Comdr.—Capt. W. A. Hannay, L'pool R., from a Flying Officer, March 1st.

Equipt. Officers, 1st Cl.—And to be temp. Capts. whilst so empld.:—Jan. 3rd.—From Instrs. (graded as Equipt. Officers, 2nd Cl.), School for Wireless Operators:—Temp. Lt. R. Cook, Gen. List; Lt. F. Murphy, Spec. Res. From Equipt. Officers, 3rd Cl.:—Temp. Lt. A. L. Wilson, Gen. List; Lt. S. Ransom, Spec. Res., March 1st; Temp. Lt. M. L. Horn, Gen. List, March 30th.

SCHOOLS OF INSTRN.—SCHOOL OF TECHNICAL TRAINING (MEN).—Co. Officers (graded as Equipt. Officers, 3rd Cl.).—Temp. Lt. J. S. Craig, R. Scots Fus., and to be transfd. to R.F.C. Gen. List; Lt. D. B. Martin, R.E., T.F.; Lt G. A.McMillan, Sco. Rif., T.F., and to be secd.; Temp Lt. J. More, R. Scots Fus., and to be transfd. to R.F.C. Gen. List; Lt. K. J. Falconer, Gordon Highrs., T.F., and to be secd.; Sec. Lt. W. H. Hume, Gordon Highrs., T.F., and to be secd.; Sec. Lt. O. Lawrence, Gordon Highrs., T.F., and to be secd.; Sec. Lt. J. M. Adams, Gordon Highrs., T.F., and to be secd.; Sec. Lt. A. Henderson, R. Scots Fus., and to be secd.; Sec. Lt. J. W. Mennie, Gordon Highrs., T.F., and to be secd.; Temp. Sec. Lt. R. C. Smith, attd. R. Scots Fus., and to be transfd. to R.F.C. Gen. List; Sec. Lt. A. E. T. Robinson, Gordon Highrs., T.F., and to be secd.; Sec. Lt. G. Thomson, Gordon Highrs., T.F., and to be secd., Feb. 27th; Temp. Lt. A. Duthie, Gordon Highrs., and to be transfd. to R.F.C. Gen. List; Temp. Lt. C. Kenyon, attd. Gordon Highrs., and to be transfd. to R.F.C. Gen. List, Feb. 28th; Temp. Sec. Lt. T. Smith, Lab. Corps, and to be transfd. to R.F.C. Gen. List, March 1st.

WAR OFFICE, April 29th.

REGULAR FORCES—ESTABLISHMENTS—R.F.C.—MIL. WING.—Wing Comdr.—Capt. (temp. Maj.) W. D. S. Sanday, D.S.O., M.C., Spec. Res., from a Sqdn. Comdr., and to be temp. Lt.-Col. whilst so empld. (March 21st, seny. March 12th).

Experimental Officers, 1st Cl.—(Graded as Equipt. Officers, 1st Cl.)—And to be temp. Capts. while so empld. (March 1st):—Lt. W. W. Stainer, R. Suss. R., T.F., from the 2nd Cl. (graded as an Equipt. Officer, 2nd Cl.); Temp. Lt. W. G. M. Nicholl, Gen. List from an Equipt. Officer, 2nd Cl.

SCHOOLS OF INSTRN.—WIRELESS SCHOOL.—Chief Instr.—(Graded as a Park Comdr.)—Lt. (temp. Capt.) R. P. J. M'Coy, Spec. Res., an Equipt. Officer, 1st Cl, and to be temp. Maj. while so empld. (Jan. 3rd).

Gen. List.—1st Cl. Air Mech. H. M. Bateson, from R.F.C., to be temp. Sec. Lt. (Feb. 25th).

Lt. J. H. Truscott, Devon. R., from a Flying Officer (Obsr.), to be temp. Capt. (with pay and allowances as Lt.) while actg. as Adjt. (Feb. 25th).

FROM THE COURT CIRCULAR.

WINDSOR CASTLE, April 26th.

The King and Queen, accompanied by the Princess Mary, and attended by Capt. B. Godfrey-Faussett. R.N., and the Earl of Cromer, visited the works of Messrs. Gordon Watney and Co., Limited, this morning. Their Majesties were received, and were conducted round the works, by the Hon. H. C. Butler, chairman; Maj. Gordon Watney, managing director; and the officials of the company.

Lt.-Col. I. B. Davson was also in attendance, representing the Aircraft Production Department of the Ministry of Munitions.

WINDSOR CASTLE, April 27th.

The King, attended by the Gentlemen in Waiting, went to London this morning.

His Majesty held a Council at Buckingham Palace at 10.45 o'clock. There were present:—The Lord Robert Cecil, M.P. (Minister of Blockade; acting for the Lord President), the Earl of Granard, the Lord Colebrooke (Captain of the King's Body Guard of the Hon. Corps of Gentlemen at Arms), and the Lord Southborough.

Previous to the Council the Lord Robert Cecil, M.P., was received in audience by the King, and on behalf of the Lord Rothermere surrendered the Seals of Secretary of State of the Royal Air Force and President of the Air Council.

At the Council his Majesty handed the Seals of Secretary of State of the Royal Air Force and President of the Air Council to the Right Hon. Sir William Weir, who took the Oath of Office and kissed hands upon his appointment.

The Right Hon. Sir William Weir had an audience of the King after the Council.

* * *

The following officer had the honour of being received by his Majesty, when the King invested him with the Insignia of the Distinguished Service Order and the Military Cross:—Major Fred Holliday, R.A.F.

* * *

His Majesty then conferred decorations as follows:—

THE MILITARY CROSS.—Maj. Alfred Ellis, A.F.C.; Capt. Adrian Cole, A.F.C.; Capt. Donald Day, Hampshire R. (also to receive the Distinguished Service Cross awarded to his brother, the late Flt. Sub-Lt. Harold Day, R.N.A.S.); Capt. Leslie Holden, A.F.C.; Capt. Allan Jones, A.F.C; Capt. Cecil King, R.A.F.; Capt. William O'Neill, Indian Army and R.A.F.; Lt. William Coates, A.F.C.

WINDSOR CASTLE, April 29th.

A party of Officers and Men of the United States of America Expeditionary Force were invited by The King and Queen to visit Windsor Castle to-day.

Major F. G. Noel (Royal Air Force) was present, and the Ladies and Gentlemen of the Household in Waiting were in attendance.

OFFICIAL COMMUNIQUES.

NAVAL.

ADMIRALTY COMMUNIQUÉS.

APRIL 24th.—Following the naval operation on the enemy's coast yesterday morning, observations were made by aircraft and bomb attacks carried out.

Observation was difficult owing to clouds, and on this account our machines descended as low as 50ft.

A clear break twenty yards wide was observed in the Zeebrugge mole at its inner end.

At Ostend a sunken object was seen lying between the piers and blocking the greater part of the fairway.

Numerous bombs were dropped on objectives on shore.

APRIL 27th.—On April 23rd, Durazzo was attacked by British air forces. The only man-of-war in the harbour was one gunboat. Our machines attacked the seaplane base, dropping nearly a ton of bombs, with apparently successful results

All our machines returned safely to their base.

MILITARY.

G.H.Q. COMMUNIQUÉS.

APRIL 23rd, 9.16 p.m.—On the 22nd inst. another useful day's work was done by our aeroplanes. Several long-distance reconnaissances were carried out, and many photographs were taken.

Our bombing machines were very active, and dropped 19 tons of bombs on numerous targets, including Thourout railway station, Engel ammunition dump, Warneton, Armentières, and Roulers.

The fighting in the air was not heavy, considering the fine weather and the amount of work done by our artillery reconnaissance and bombing machines. Seven hostile aeroplanes were brought down, and six others driven down out of control. In addition, one German machine was shot down in our lines by our anti-aircraft fire, and two hostile balloons were destroyed by our aeroplanes.

Three of our machines are missing.

APRIL 24th, 8.47 p.m.—On the 23rd instant the weather was not very favourable for flying until 5 p.m., after which hour some sharp fighting took place in the air.

Low reconnaissances and artillery work were carried out throughout the day, and Merville, Estaires, Steenwerck, La Gorgue, Chaulnes railway junction, and the docks at Ostend were heavily bombed.

Fourteen hostile machines were brought down and two others driven down out of control. Another German machine was brought down in our lines by our anti-aircraft fire.

One of our aeroplanes is missing.

During the night flying squadrons dropped over 20 tons of bombs on different targets, including Roulers, Merville, Armentières, Bapaume, the railway station at Chaulnes, Thourout, Tournai, Courtrai, and the docks at Zeebrugge. Direct hits were obtained on all these targets; in several cases fires were started.

All our machines returned.

APRIL 25th, 9.7 p.m.—On the 24th instant mist again hampered work in the air.

Our aeroplanes on the southern part of the British front carried out several low reconnaissances, and engaged the enemy's attacking troops in the neighbourhood of Villers-Bretonneux with bombs and machine-gun fire from a very low height.

Two hostile machines were brought down in combat and another was shot down in our lines by our infantry.

Two of our machines are missing.

During the night the southern portion of the front was covered in mist, and our machines were unable to leave the ground

In the north, however, five and a half tons of bombs were dropped by us on Estaires, Armentières, Roulers, and the railway stations at Courtrai and Thourout.

All our machines returned.

April 26th, 9.10 p.m.—On the 25th inst. mist during the morning and thunderstorms later in the day prevented much flying being accomplished until the evening.

In the northern area, however, the enemy's positions in the neighbourhood of Kemmel were reconnoitred by our machines, our pilots being compelled to fly within a few feet of the ground in order to make observation possible.

Six hundred and fifty bombs were dropped by us on Menin, Roulers, Armentières, and on the enemy's billets.

Ten hostile machines were brought down in air fighting, and two others were driven down out of control. Four other German machines were shot down by anti-aircraft gunfire and one by fire from our infantry.

Two of our machines are missing.

April 27th, 7.15 p.m.—On the 20th inst., except for low reconnaissances of the battle front, little flying was possible owing to thick mist.

Two low-flying German aeroplanes were brought down by our infantry.

None of our machines is missing.

April 28th, 8.20 p.m.—On the 27th instant thick fog again prevented flying, except for a few low reconnaissances of the battle front.

Only two flights took place, in one of which a hostile machine was brought down.

None of our machines is missing.

April 29th, 7.55 p.m.—Beyond carrying out one or two low-flying reconnaissances and dropping a few bombs on various targets, our aeroplanes were unable to do any flying on the 28th inst. on account of low clouds, mist, and rain.

War Office Communiqués.

April 27th.—The G.O.C. Macedonia reports:—

On April 21st a hostile aeroplane was driven down out of control near Barakli-Dzuma (south-west of Demir-Hissar).

April 27th.—The G.O.C. Mesopotamia reports:—

On April 21st one of our aeroplanes brought down a hostile machine; the occupants, both of whom were German, were killed.

April 28th.—The G.O.C. Macedonia reports:—

A bombardment was carried out by the British Air Service upon enemy encampments around Demir Hissar and Serres.

THE CASUALTY LIST.

NAVAL.

Reported April 29th.

Killed.—McNichol, E. J. L., Air Mech., 2nd Gr., F29069; Pool, E. C., Actg. Air Mech., 1st Cl., F12787; Rouse, J., Air Mech., 2nd Gr., F50269; Wilkinson, C. A., Air Mech., 2nd Gr., F26703.

Wounded.—Deighton, D., Actg. Air Mech., 1st Gr., F19791; Eldred, G. P., Air Mech., 2nd Gr., F47354; Frew, R. J., Air Mech., 2nd Gr., F39638; Goodwin, R. G., Air Mech., 2nd Gr., F52189; Humphreys, A. J., Air Mech., 1st Gr., F13698; Hutton, J. S., Air Mech.; Price, A. H., Actg. Air Mech., 1st Gr., F19846; Trippier, F., Air Mech., 1st Gr., F12814; Warrington, G., Actg. Air Mech., 1st Gr., F26702.

Reported April 30th.

Zeebrugge Raid.

Missing, believed Killed.—Brock, Lt.-Col F. A., R.A.F. (Act. Wing Comdr., R.N.).

PERSONAL NOTICES.

NAVAL.

Deaths.

BROCK.—Frank Arthur Brock, Sqdn.-Comdr. R.N.A.S., who was killed in the attack on the Mole at Zeebrugge, was the eldest son of Mr. Arthur Brock of the firm of C. T. Brock and Co., whose name is known all over the world as firework manufacturers. He was born in 1884, and was educated at Dulwich College, later entering the family business, of which he became a director. At the beginning of the war he joined the R.N.A.S., and distinguished himself in connection with the raid on Friedrichshafen. Later he became a pilot, and won rapid promotion.

In 1916 he was gazetted flight-commander, and soon afterwards became acting squadron-commander. His special knowledge of explosives and his inventive ability were employed to good purpose. For some time he was connected with the Inventions Board, under Lord Fisher. In recognition of his valuable services he was given the O.B.E. last January.

His last technical service to his King was mentioned in Parliament last week, when the First Lord of the Admiralty ascribed to him the devising of the smoke screen, under cover of which the attack on Zeebrugge was delivered.

He was a good all-round sportsman, excelling in football and boxing, and was a good rifle and game shot. His love of adventure is shown by the fact that when, in organising the Friedrichshafen affair, Lt. Pemberton-Billing was looking for volunteers for a certain part of the work, on the conditions that they would come with him, obey orders, and ask no questions till the job was done, Frank Brock at once volunteered, although 22 other good men had previously been asked and had refused.

He made good then, on his first duty in the King's service, and he made good in his last. He made good all through, and he died fighting. None can wish for a better record.

KING.—Lt. Vernon King, Royal Marines, attd. R.A.F., who was killed in the air on April 11th, aged 31, was the youngest son of Mr. and Mrs. W. J. King, of Gravesend. He was educated at the Gravesend Proprietary School, Grays College, and Guelph Agricultural College, Canada, where he graduated as B.S.A. He accepted a Government appointment as entomological expert for agricultural work in Kansas, U.S.A., but relinquished it on the outbreak of war to return to fight. He saw service in Egypt, Lemnos, and France. In September, 1917, he transferred to the R.F.C., and gained his observer's wing.

PARKINSON.—Flt. Lt. George Robert John Parkinson, R.N., who was killed whilst on patrol duty on April 13th, was the only son of the late Dr. Parkinson and Mrs. Parkinson, of Portland Cottage, Henley-on-Thames. He was 19 years of age.

Engagement.

DURSTON—VEREKER.—The engagement is announced between Flt. Comdr. A. Durston, R.N.A.S., and Vera Vereker, of Nettlestone House, Isle of Wight.

MILITARY.

Deaths.

BALFOUR.—Lt. Bernard Balfour, London Reg. and R.A.F., son of Mr. and Mrs. A. H. Balfour, 41, Merton Hall Road, Wimbledon, S.W., was killed on April 16th, in his 21st year. Educated at King's College School, he was a sergeant in the O.T.C. when war broke out and captain of the shooting eight. He obtained a commission in the London Regiment in March, 1915, went to France in June, 1916, and joined the Royal Flying Corps in November of that year while in France as an observer. He served as such till June, 1917, and obtained his pilot's certificate in August, 1917. On gaining this he again proceeded to the front, remaining there until he was killed flying on patrol duty. He was a good all-round sportsman, being in the school fifteen at football, and a good swimmer and tennis player.

BEGBIE.—Lt. S. C. Hamilton Begbie, E. Surr. Regt., attd. R.A.F., was killed in action in the air on April 21st, aged 20. He was the only child of Mr. and Mrs. Sydney D. Begbie, of Hill Head, Fareham, Hampshire, and late of Richmond Hill, and was educated at Bowden House, Harrow, Charterhouse, and Switzerland. He obtained his commission at 17, and saw active service on the Somme in 1916, returning to the front in 1918 at his own request. His father, Mr. Syd Begbie, was, in his time, a well-known sportsman, and his name is familiar as managing director of the Aster Engineering Co., Ltd. His many friends in the Aircraft Industry will offer him and his wife their very deep sympathy.

CANN.—Sec. Lt. P. R. Cann, R.F.C., who died on April 5th in hospital abroad, of wounds received in action on April 1st, was the younges son of Mr. and Mrs. Fred Cann, of Bude.

DENT.—Lt. Edgar Dent Dent, Irish Guards, who was killed on April 12th, aged 27, was the only son of Mr. and Mrs. Alfred Dent, of 55, Lee Park, Blackheath, Kent. He was trained from earliest boyhood in rifle shooting, and began a remarkable record when a Public School Cadet. This brought him under the personal notice of the late Lord Roberts, from whom he received great encouragement. In addition to many other successes, at Bisley and elsewhere, when reaching the age of 17, and thereby eligible to compete in "The King's," he tied for a place in the "300," and was ultimately placed 303rd out of 1,480 picked shots from all parts of the Empire. He received his first commission in 1907 in the 3rd V.B. Royal West Kent Regiment. Before the outbreak of the war in 1914 he had joined the Reserve Battalion, Royal Dublin Fusiliers. From the Royal Dublin Fusiliers he was posted to the 1st Royal Irish Rifles, with whom he was at Fromelles in 1915. A few weeks later he was dangerously wounded at Fleurbaix, and after recovery was transferred to the R.F.C., and obtained his wings. In 1916 he went to East Africa, but had to return for a surgical operation. He subsequently resumed duty at home with the R.F.C., and on recovery from an attack of appendicitis he joined the Irish Guards. In 1915, he married Isobel, second daughter of Mr. and Mrs. R. McNab, of Old Charlton, Kent.

HARKER.—Sec. Lt. Edward Keith Harker, R.G.A., attd. R.A.F., who died of wounds on April 18th, was the elder son of Edward and Annie Harker, Berkhamsted. He was 20 years old.

HERRON.—Lt. Kenneth Chester Herron, Yeo., attd. R.A.F., of Wickham Place, Witham, Essex, youngest son of the late George Oliver Mellick Herron, and of Mrs. Janson, of Newdigate Place, Newdigate, Surrey, was killed on April 24th, aged 37. He was educated at Bradfield College and abroad, and obtained a commission in the Yeomanry in Jan., 1915, and went to France in July, 1916. He transferred to the R.F.C. last August. Mr. Herron leaves a widow.

IPSWICH.—William Henry Alfred Fitzroy, Viscount Ipswich, Coldstream Guards and R.A.F., only son of the Earl of Euston, and grandson of the Duke of Grafton, was killed while flying in Wiltshire on April 23rd.

Lord Ipswich, who was 33 years old, was educated at Harrow and Trinity College, Cambridge. He served with the Coldstream Guards in France, and was wounded. He married, in 1913, Auriol Margaretta, only child of Major Brougham, of Potterspury House, Northamptonshire, and leaves a son, born in 1914, who becomes second heir to the dukedom, and a daughter.

Viscount Ipswich went from Cambridge to Wye Agricultural College. Afterwards he accepted an appointment in an agricultural company in Egypt and was for several years engaged in land reclamation there. On the outbreak of war he was on the staff of Wye College and at once enlisted in the East Kent Regiment. Shortly afterwards he was given a commission in the Coldstream Guards and was sent to France early in November, 1914. In the spring of 1915 he was invalided home with shell-

shock and did not return to France until the summer of 1916. In the autumn of last year he returned to England to train as an observer in the Royal Flying Corps, and obtained his wing in February of this year. Though considerably above the recognised age-limit, he passed on to a pilot's course and met his death almost at the completion of his period of training.

LUCHFORD.—Capt. Harry George Ernest Luchford, M.C., R.F.C., whose death is officially reported, was the eldest son of Mr. and Mrs. George J. Luchford, of Bromley, Kent. On the outbreak of war he was engaged as a clerk in Martin's Bank, Lombard Street, E.C. He enlisted almost immediately in the Norfolk Regiment, and received his commission in the A.S.C. in September, 1914. He served in France with the Indian (Meerut) Divisional Cavalry from Dec., 1914, to Jan., 1916; was transferred to the R.F.C., and qualified as a pilot on May 19th, 1917, and proceeded at once to the front, where his successes obtained recognition by the award of the M.C. and Bar. He is said to have brought down 27 enemy machines.

MADELEY.—Sec. Lt. Claude Neville Madeley, R.F.C., who was killed during a combat in the air on Jan. 19th, was the youngest son of the late William Madeley, of Worcester, and Mrs. Madeley, of Sherrington House, Kingston-on-Thames. He was born at Worcester in 1894, and was educated at Wimbledon College, afterwards joining the Polytechnic Engineering School and gaining the bronze medal in his last year for motor engineering. In January, 1914, he went to the Westinghouse Engineering Works, Manchester. When war broke out he enlisted in a field company of the Royal Engineers, being transferred later to a signal company. He was with the 11th Division at the historical landing at Suvla Bay, and also at the evacuation. After some time spent in Egypt he was ordered to France, where he was made a corporal, subsequently becoming a dispatch rider. In May, 1917, he returned to England and received a commission in the Royal Flying Corps, and returned to the front as a qualified pilot in December.

McCUDDEN.—Sec. Lt. J. A. McCudden, M.C., R.F.C., who was reported missing a month ago, is now officially stated to have been killed. Mr. McCudden was a brother of Capt. J. Byford McCudden, V.C., D.S.O., M.C. It is with deep regret that one records the death of Mr. McCudden, who followed so well his brother's fine example. He had done remarkably good work, and is reported to have destroyed 11 enemy aeroplanes. He was awarded the Military Cross only a few weeks ago, the award being gazetted on April 22nd, the day before his death was announced.

RAYMOND-BARKER.—Maj. Richard Raymond-Barker, M.C., R.A.F., who was killed in aerial action on April 20th, was the son of Edward and Rose Raymond-Barker, of Bisley, Gloucestershire. He was 23 years of age.

READING.—Sec. Lt. V. J. Reading, R.F.C., reported missing on March 26th, is now unofficially reported to have been killed, aged 22. He was the only son of Mr. A. Y. Reading, Knodishall Lodge, Suffolk, and was educated at Woodbridge Grammar School. His commanding officer writes: "During the great offensive he did good work, brought back reports of the highest value, bombed and machine-gunned enemy troops in a way that one could not but feel the greatest admiration for his initiative and courage."

REECE.—Capt. Frederick Bennett Reece, R.E., attd. R.A.F., who died on April 20th at a military hospital from wounds, was the third son of the late Samuel Reece, and of Mrs. Reece, Highfield, Wallasey.

SAUNDERSON.—Capt. Samuel Treherne Saunderson, R.A.F., who was killed in a flying accident, was the husband of Florence Saunderson, 19, Cliveden Place, S.W. He was a member of the Special Cavalry Reserve who had joined the Air Service, and was appointed flight commander in October, 1915.

SHEIL.—Lt. Charles Sheil, R.A.F., killed on April 22nd, was the youngest son of Mr. and Mrs. R. H. Sheil, of 24, Burlington Road, Dublin. In September, 1914, he joined the famous "D" company of the Royal Dublin Fusiliers, and served with them in Gallipoli, where he was wounded for the first time. He rejoined in time to take part in the retreat in Serbia, and remained with the remnants of the 10th Division at Salonika until he obtained a commission in the 1st R. Munster Fus., with whom he served in France from March, 1917. When leading his platoon at the Messines-Wytschaete battle on June 7th he was wounded for the second time. He remained with the R. Munster Fus. until Nov., 1917, when he joined the R.F.C., and having completed his training went to the front early this year. He was mentioned in dispatches and awarded the Parchment Certificate for gallant conduct and devotion to duty in the field.

SMITH.—Lt. Ralph Eustace Smith, R.A.F., whose death in action is just announced, was the second son of the late Eustace Smith, of Benton House, near Newcastle-on-Tyne, and a grandson of the late Thomas Eustace Smith, of Gosforth Park, for many years M.P. for North Shields and Tynemouth. He joined a battalion of the Northumberland Fusiliers as Second Lieutenant on the outbreak of war, and was later transferred to the Northumberland Hussars, with whom he served for some time in France. Last autumn he joined the R.F.C., and up to the time of his death had been acting as an observer in a night-bombing machine, having been specially mentioned for his good work. Mr. Smith was a director of Thomas and William Smith, Ltd., of Newcastle, and of Smith's Dock Co., Ltd., of North and South Shields and Middlesbrough. He married a daughter of Mr. Edward Joicey, of Blenkinsopp, and leaves a widow and two children.

WINMILL.—Lt. Westropp Peyton Winmill, Bedfordshire Regt., who was attd. R.F.C. for 20 months, was killed in action on March 22nd. He was the eldest son of the late Geo. Winmill and of Mrs. Winmill, Bedford, and husband of Myfanwy Winmill, Reading, and was 23 years of age.

Engagements.

CARTER—RYE.—The engagement is announced of Lt. Albert Carter, M.M., R.A.F., of Calgary, Canada, to Hilda Gertrude, younger daughter of Mr. and Mrs. H. W. Rye, of Folkestone, Kent.

EMPSON—PATTERSON.—The engagement is announced of Lt. Ralph H. W. Empson, D.L.I. and R.A.F., and Mabel Elizabeth, youngest daughter of Dr. and Mrs. John Patterson, of The Green, Ramelton, Co. Donegal.

PATRICK—GROSS.—An engagement is announced between Maj. C. K. Cochran Patrick, D.S.O., M.C., R.A.F., and Ella, daughter of Mrs. Sydney Gross, of Gloucester House, Park Lane.

WILLIAMS—MACARTHY.—A marriage has been arranged,

and will shortly take place, between Mr. W. Cay Williams, Leicestershire Regt., attd. R.A.F., and Mona, youngest daughter of Mr. and Mrs. Leonard Macarthy, Benwell Park, Newcastle-on-Tyne.

MARRIAGES.

CHALMERS—CRAN.—On April 26th, at St. Andrew's Parish Church, Edinburgh, Lt. Edward Ernest Chalmers, R.F.A. and R.A.F., eldest surviving son of the late Rev. John Chalmers, minister of the parish of Ashkirk, and of the late Mrs. Chalmers, 1, Grange Terrace, Edinburgh, was married to Isabella Donaldson, eldest daughter of John Cran, Esq., Backhill House, Carberry, Inveresk, by the Rev. William Edie, minister of the parish church of St. Michael Inveresk.

NICHOL—GELLATLY.—On April 20th, at St. Paul's Church, Cliftonville, Margate, Capt. E. F. Nichol, M.C., Loyal North Lancashire Regt. and R.A.F., youngest son of Dr. and Mrs. Nichol, of Margate, was married to Edith Frances, younger daughter of Mr. and Mrs. P. F. Gellatly, of Margate, by the Rev. E. W. Taloy Jones, assisted by the Vicar, the Rev. Herbert Pegg.

BIRTHS.

GREENSHIELDS.—On April 27th, at 16, Helenslea Avenue, Golder's Green, to Doris (née Emblow), wife of Lt. J. W. Greenshields, Essex Regt. and R.A.F.—a son.

HARBORD.—On April 26th, 1918, at 40, Upper Fitzwilliam Street, Dublin, the wife of Capt. K. B. Harbord, R.F.A. and R.F.C., of a son.

JARVIS.—On April 26th, at 34, Albert Road, Regent's Park, Evelyn Mary, the wife of the late Capt. Ralph H. Jarvis, M.C., R.F.C., of a daughter

---

Capt. Sydney Philip Smith (Flight Commander), R.F.C., has been missing since April 6th. Information is earnestly desired by Mr. and Mrs. Arthur Smith, Morningside, Aldershot.

* * *

Mrs. Tilney hopes that all those who wrote such kind letters to her on the death of her son, Major Leonard A. Tilney, M.C., Household Cavalry and R.F.C., in aerial action on March 9th, will forgive her delay in answering. She hopes to do so in time and in the meanwhile is deeply grateful for all the sympathy extended to her and Colonel Tilney.

* * *

Sec. Lt. J. B. Welman, R.F.C., was taken prisoner on October 31st, 1917. If the next-of-kin of other prisoner officers receive news of him will they kindly communicate with Mrs. Johnson, 87, Kensington Gardens Square, London?

AIR FORCE.

DEATHS.

BENNETT.—At an inquest held by an Eastern Countie coroner on April 27th, on the body of Lt. Owen Hewitt Dampie Bennett, R.A.F., who belonged to Birmingham, a brother office described the collision which resulted in the death of the de ceased. He said he was up about 700 ft. when deceased flev over him between 300 ft. to 400 ft. higher, and suddenly fell Witness tried to get out of his way, but had not sufficient spee to get clear. The nose of his machine jammed in the under ca riage of deceased's machine, and they locked together. Bot machines rolled over and over for 300 ft., when witness's machin broke adrift, smashing the lower planes of the other machin which crashed to the earth. Witness came out of the lock in dive, and then planed down. Dr. Weir, a naval surgeon, sai deceased had a broken back and other injuries.

A verdict of accidental death was returned.

BLACK.—Lt. Donald Curdie Black, of Mount Morat, Victori died on April 23rd as the result of an aeroplane accident.

Telegrams: "Prosalt," West-Cent., London. 'Phone: 2655 Museum.

CHAMBERLIN.—Sec. Lt. J. B. Chamberlin, R.A.F., who was accidentally killed on April 23rd, was the second son of H. W. Chamberlin, of Restronguet, Penryn, Cornwall. He was 19 years of age.

EXLEY and BEADLE.—Sec. Lt. Exley, R.A.F., and Serjt. Beadle, R.A.F., were drowned while flying off the South Coast near Hythe on April 23rd.

FRASER.—A verdict of "Accidental death" was returned at Ruislip on April 25th, on Donald Fraser, 21, an American soldier, who was killed by a blow from an aeroplane propeller.

HOWELL, ROBINSON, and CLAYTON.—Verdicts of accidentally killed were returned at inquests in a Yorkshire town on April 23rd on the bodies of Lt. Evan J. Howell, R.A.F., of Pontypridd; Lt. Harry E. Robinson, R.A.F., of West Ealing; and Sec. Lt. A. Clayton, R.A.F., of Horsley, Shropshire, who were killed on April 21st by a collision in mid-air between two aeroplanes, as reported last week. An officer said that whilst the machines were at a height of over 2,000 ft above a country village, one solely in charge of Mr. Howell and the other carrying Mr. Robinson and Mr. Clayton, they struck each other nose to nose, and crashed to the ground. All three officers were dead when picked up. A farm lad said that he saw the machines meet and the wings strike together. The side wings dropped off and the machines crashed into a meadow.

OWEN-HOLDSWORTH.—Sec. Lt. James Philip Owen-Holdsworth, R.A.F., who was killed in action on April 12th, was the eldest son of Mr. and Mrs. Owen-Holdsworth, of Jewell House, Marden, Kent. He was 19 years of age.

THOMPSON.—Lt. Eric Barton, R.A.F., who was killed abroad as the result of an aeroplane accident on April 8th, was the eldest son of H. C. Thompson, of Buenos Aires.

WHELAN and LEVEY.—Lt. Cyril Whelan, R.A.F., son of Mr. Albert Whelan, was killed in an aeroplane collision, which occurred at a south-eastern aerodrome on April 26th. Lt. Levey, R.A.F., who was killed in the same accident, was a cousin of Mr. Whelan, and a son of Mr. Bert Levey.

WINTON.—Sec. Lt. Harold Barkley, R.A.F., who was killed on April 21st as the result of an aeroplane accident, was the only son of William and Edith Winton, Beddington, Surrey. He was 24 years of age.

Engagements.

ASSINDER—SINCLAIR.—An engagement is announced between Lt. Francis Richard Assinder, R.A.F., son of Mr. Thoma

MARRIAGES.

GLANVILLE—SAVORY.—On April 20th, in London, Hugh Fanshawe, Capt., Royal Air Force, younger son of the Revd. O. F. Glanville, of South Brent, Devon, was married to Beatrice Gertrude, widow of Lionel C. H. Savory, of Dibden, Southampton, by licence.

GRANT—ST. JOHN.—Capt. Grant, R.A.F., formerly Lt. Tryggve Gran, of the Norwegian Navy, who in 1914 flew from Cruden Bay, Aberdeenshire, to Norway, was married on April 29th, at the Strand Registry Office to Miss Lily St. John (Lilian Clara Johnson).

STAMMERS—SPENCER.—The marriage between Maj. H. V. Stammers, R.A.F., second son of Mr. and Mrs. S. J. R. Stammers, Beaconsfield, Gunnersbury, and Alice Margaret, only daughter of the late J. E. H. Spencer, and of Mrs. Spencer, of 18, Montague Road, Richmond, took place on May 1st, at St. Matthias's Church, Richmond Hill.

FOREIGN COMMUNIQUES.

FRANCE.

APRIL 24th.—The bad weather hampered aerial activity.

The air raid alarm last night was occasioned by an enemy aeroplane, which was picked up by the searchlights and attacked with violent gun-fire. It was forced to descend near Nogent l'Artaud, in the neighbourhood of Meaux. It proved to be a bombing triplane, and the occupants, a lieutenant, a non-commissioned officer, and a machine-gunner, were made prisoners.

APRIL 26th.—During the 22nd and 23rd of April seven German aeroplanes and a captive balloon were brought down by our pilots. Ten other machines fell in their lines severely damaged as the result of combats.

It is confirmed that two enemy aeroplanes reported as driven down out of control on the 20th were really brought down. Five other German machines and a captive balloon were also destroyed on the 21st, in addition to those already indicated in the communiqué of that date.

On April 23rd and during the night of April 23rd-24th 5,000 kilogrammes (5 tons) of projectiles were dropped by our bombers on the stations of Nesle, Roye, and Chaulnes.

Where Flying Men are fitted out.

ONE SERVICE

Uniformity of custom and kit; on land, on sea and in the air one organisation only—unity of control centring on one ideal—efficiency. That is the ideal aimed at by the R.A.F. It also summarises the policy of Dunhills; as the R.A.F. have co-ordinated all the efforts and abilities of its two parent services for the better 'strafing' of the Hun so is every idea, every thought and every effort concentrated by the House of Dunhill on the problem of eliminating weather.

The land crab knows nothing of weather inconvenience—it is left to men of the R.A.F., who fight it in its own headquarters, to feel the full fury of its All Highest displeasure.

But Dunhills know and have provided for the worst to the last little detail; and it is just this expert "understanding" knowledge that made them so indispensable to men of the old Air Forces.

The new Force still has the old traditions, the old enemies and now they are one service they still have Dunhills for equipment—the one service that will never fail them.

Call in, if you can, at our well-known "base" in Conduit Street—a few paces from Regent Street—and inspect the full kit. Or, if London is "out of bounds," drop a line for patterns and full details which will be sent gladly on request.

AEROPLANE CONSTRUCTORS

Contractors to the Admiralty

TELE{GRAMS: Aircraft / PHONE: 1176} EASTBOURNE

Our aeroplanes further carried out numerous attacks with machine-guns on gatherings of enemy troops.

April 26th.—Army of the Orient.—Two enemy aeroplanes have been brought down.

April 29th.—Two German aeroplanes were brought down by our pilots during April 27th.

On the same day our bombarding machines dropped six tons of bombs on establishments in the enemy zone.

GERMANY.

April 23rd.—During the last two days 30 enemy aeroplanes were brought down. Lt. Buckler achieved his 32nd victory and Lt. Monckhoff his 25th.

April 24th.—Rittmeister Baron von Richthofen has not returned from his pursuit of an enemy across the Somme battlefield. According to an English report he has fallen.

ITALY.

April 24th.—British aviators shot down two enemy aeroplanes over Levoco, and two more near Mt. Lisser. A fifth was hit by our own aviators and fell in the vicinity of Vidor.

April 24th.—During the day of April 22nd, in spite of unfavourable weather conditions, our hydro-aeroplanes were active in the Upper Adriatic. Reconnoitring machines having observed in the neighbourhood of Pola and Rovigni movements of enemy torpedo craft and small cargo-ships, one of our bombing squadrons made an attack during the morning and succeeded in getting two direct hits on a torpedo boat.

In the afternoon a surprise attack was made on a warship in the Fasana Canal, which was protected by torpedo boats and hydro-aeroplanes. One hydro-aeroplane was brought down by our machines and fell into the sea in pieces. The warship and the torpedo craft were heavily bombed. One of our machines was damaged and forced to land in the sea very near the enemy coast, but the other machines, in spite of the heavy sea, succeeded in descending and saving the pilot.

April 26th.—In air combats over Conegliano (about 10 miles east of the Piave) our aviators brought down two enemies.

TURKEY.

April 23rd.—On the Palestine front, one of our aeroplanes brought down in aerial combat an enemy behind our lines.

April 27th.—One enemy aeroplane was brought down in the neighbourhood of Nablus. The observer was killed. The pilot was wounded and taken prisoner.

BELGIUM.

April 27th.—In the course of a fight three of our aviators attacked four German aeroplanes forming part of a squadron of more than 20, and brought down one, in flames in our lines.

ALUMINIUM CASTINGS

OF EVERY DESCRIPTION.

We make a Speciality of Aeronautical and Automobile Work.

We are making many thousands of **Aluminium Die Castings** weekly under the celebrated **Gothias** process—in many cases **entirely eliminating** machining operations, and we hold the sole manufacturing rights in the British Empire for this process.

Chemical and Physical tests are made on our own premises, and our **Castings,** both **Sand** and **Die,** are produced under the most up-to-date and scientific methods.

Sole makers of the **Birmal Aluminium Pistons,** thousands of which are running to-day in a highly satisfactory manner under the most severe conditions.

Highest Class Castings to Government Specifications. Prompt Delivery.

ON THE TASK OF THE NEW AIR MINISTER.

Our new Air Minister, Sir William Weir, starts his arduous task with certain great advantages over nearly all Cabinet Ministers who have ever taken office. In the first place all who are concerned for the winning of the war and for the welfare of the Flying Services wish him well. In no direction has there been any criticism of his appointment. He has never been a politician, so there has been no political opposition. And he has already done so much to increase the output of aircraft, as a member of the old Air Board and as Director-General of Aircraft Production under the new Air Ministry, that he has the confidence of all who have technical knowledge.

The act of appointing as Minister a man who really knows the workings of the department which he is to control is so entirely subversive of all political precedent that one is violently tempted to think that there must be something wrong somewhere. Yet even the chronic malcontents, the hypercritical, and the ultra-suspicious have not yet been able to discern the proverbial nigger in the wood-pile. It actually seems as if, for once in the disastrous political history of this war, the Government has done the right thing. It must obviously be an accident, but it is certainly the happiest accident that could have happened.

All the best things in life happen by accident, and Sir William Weir's appointment seems to be one of them. Or perhaps one might better ascribe the present promising position to that form of accident which consists in possessing that inherent faculty for seizing the tide in the affairs of men which, taken at the flood, leads on to fortune. To continue the simile beyond the point to which Shakespeare used it, one may point out that the skipper who catches the right tide brings fortune not only to himself, but to those who are in the same boat with him and to the owners of the boat. One hopes that such may be our case, and that the arrival of Sir William Weir on the flood tide following the low tide which stranded Lord Rothermere may bring good fortune to all in the Air Force boat and to the owners of the boat, who are the King and his people.

Navigating Difficulties.

Even those who travel on the flood tide of good fortune have, none the less, their difficulties of navigation, and few who have started with everything in their favour have had more snags ahead than the Air Minister. It seems well, therefore, to point out briefly where the chief of those snags lies, so that twelve months or so hence we may look back and see how he has acquitted himself as skipper of this all-important craft.

It would need volumes to deal with each of the difficulties which beset the Air Minister, who has under him so many defectively organised departments that no one man could possibly hope to set them all straight himself in one human life-time. Therefore the chances of success depend entirely on the Air Minister's ability to choose his subordinates and to delegate his duties to them. In this direction Sir William Weir has already shown great capacity. In fact he would himself be the first to ascribe his own success to the loyalty and ability of his assistants. Which is the best proof that he has the priceless gift of knowing a good man when he sees him, and of letting him do his job in his own way.

The C.-in-C. Air Forces.

Before starting on problems of internal organisation, however, there are two great tasks for the Air Minister to fulfil.

The first is, obviously, the appointment of General Sir Hugh Trenchard to his proper position, where his military genius and his gift of leadership may be fittingly and fully employed in winning the war.

As one ventured to suggest last week, the only position worthy of General Trenchard is that of Commander-in-Chief, Allied Air Forces. What General Foch is on the ground, General Trenchard should be in the air.

Already there is a tendency to talk of General Trenchard as "the Foch of the Air." One submits, with all the respect which is due to the high military qualities of the Generalissimo, that Sir Hugh Trenchard's own qualities are such as to make it unfitting to describe him by the name of anyone else. One might as reasonably talk of General Foch as "the Trenchard of the ground."

In his own department of war General Trenchard stands alone, as a strategist, as a tactician, as a psychologist, and as a leader of men. If there exists in any Army a leader for whom his men have the same blind personal devotion and in whose military ability they have at the same time time the same implicit trust, he has yet to become known.

It is therefore merely obvious that the first task of the Air Minister is to assure that the services of the great leader of the Air Force are made immediately available for the good of the Allies' cause.

The Sea and Land Question.

The next great question to be settled is the division of the land and sea sections of the Royal Air Force. Daily one sees increasing the absurdity of mixing soldiers and sailors and expecting them to do their jobs properly.

Beyond the mere Aero Club Certificate stage of training the whole of the work of the two branches is utterly different. Even before that stage the time which a pupil spends on the ground should be spent in learning the Service side of his work as distinct from flying, and it is pure wicked waste of time to try to teach armies of cadets both the soldiering and sailoring side of their jobs.

A soldier is a soldier and a sailor is a sailor, and the thing which the daily papers call an "airman" may be either, but he cannot possibly be both. The level of

intelligence in this country—or any other—is not so high that a youthful cadet can learn fully in a few months all that there is to know about his own job. Even on the military side alone it is straining the lads' intellects past their proper load-point to try and teach them fighting, bombing, reconnaissance, photography, and so forth, all at once. It takes them all their time to learn one single part of the military side alone, to the degree of being highly efficient. Surely, then, the utter folly of mixing up sailoring as well is obvious.

If it is the intention to take a fully trained military aviator and turn him over to a seaplane ship or coast station to learn sailoring, then the waste of time spent on his previous education is still more ludicrous.

People have said that the Royal Marines learn soldiering and then serve on board ship, and that the R.A.F. can do likewise. The cases are not in the least analogous. The Marine is a fighting man and nothing else. The naval aviator has to be a navigator, and he has to talk Navy-talk on his wireless to the ships with which he is working, or else he is useless. He has to be all of a sailor, "and then some"—as the Americans say.

The idea of a combined Air Service to act either as an ancillary Service to the Navy and Army, or as a separate striking force, is purely imbecile. For supply only, an Air Ministry may be excellent. For administration, it may be a possibility. For operations it would be not only an abject futility, but it is a danger to the country.

Administration.

Even as regards administration, the Third Service idea is half an absurdity and half a public nuisance. One finds case-hardened Harveyised senior Naval officers getting tied into knots over military customs and regulations which are a matter of course to the majority of those under them. One finds aged admirals in command of vast numbers of troops on the ground, after having spent all their lives in charge of a few ships at sea. One finds soldiers trying to discover the meaning of the language of seaplane stations.

One finds wearied and worried Provost Marshals and A.P.Ms. heating up telegraph and telephone wires in an endeavour to find out who is to deal with the "crimes" of Air Force mechanics, for none seems to know whether a drunken air mechanic at Southend may be arrested by the Military Police, or whether it is necessary to send for a Naval picket from Sheerness, or an Air Force escort from Birmingham, or a Metropolitan policeman from Bow Street, or a janitor from the Hotel Cecil, to take him in charge. All this could have been avoided by following the obviously simple course of making the Naval aviator a real sailor, and letting the Military aviator remain a member of what Colonel Seely called "the *Corps d'Elite* of the British Army."

The Clean Cut.

However, now the harm is done, for the time being. But the sooner the Air Minister makes a clean cut between the Naval and Military branches of the R.A.F. the better it will be for both the Services, the greater will be the efficiency of the Air Force as a whole, and the higher will be his reputation in history as a statesman and as an administrator.

If the mere politicians insist, let the R.A.F. remain as such, but let the Air Minister cut the Naval side clean away from the soldiering side. When a cadet joins the Force, let him decide whether he is going to be a soldier or a sailor—if there are vacancies in both branches—and let him be trained entirely as such. Let present officers of the R.A.F. decide to which branch they will belong. Then we shall remove existing friction, owing to incompatibility of training, manners, and customs, and we shall promote healthy rivalry and competition between the Naval and Military sides.

Incidentally, what is the right word for the individual of the R.A.F.? Comparatively few of them are "airmen" in any sense of the word, for even in an Air Force which was 100 per cent. efficient there would be between thirty and fifty people on the ground for every one in the air. In a hermaphrodite Service, where the groundling is not sure whether he is a soldier or a sailor, what is one to call him? A facetious friend suggests that he should be called a "solaildier," by way of combining the two and suggesting at the same time that he also is entitled to a place *au soleil*—or in the limelight, if he likes it better.

Political Representation.

One very excellent arrangement as concerns the Air Minister is that he is to have a seat in the House of Lords, and not in the Commons. Sir William Weir's quiet and straightforward methods are better suited to the élite of the nation than to the elected of the people. When it is necessary for him to make a public statement it is more fitting that he should deliver it in the calm and dignified atmosphere of the Upper House than amid a "dog-fight" in the Lower Chamber. Apart from which, few men have better deserved a peerage than has Sir William Weir.

But, if he is to be worthily represented in the Commons, it will be well for him to secure a better representative than Major Baird. Granted that politicians are best met by politicians, it is possible for a politician to be a statesman also—Mr. Ian MacPherson is a case in point.

Major Baird is entirely unsuited to the position which he holds. His manner is as offensive as was that of Mr. Tennant, and he lacks Mr. Tennant's ability. His displays of temper are lamentable, even in an assembly possessing such slight relics of dignity as does the House of Commons. And his regard for veracity of statement is subject to as frequent lapses as is his equanimity of deportment.

So impossible is he that even the conventionally respectable members of the Parliamentary Air Committee avoid putting down questions for him to answer, and work them round on side-issues to the representatives of other departments. By such means alone can they expect to receive at once a civil and reasonably accurate reply.

Unapproved Methods.

As an example of Major Baird's methods, one recalls that some time ago a certain member of Parliament, pleading for that standardisation of aero-engines with which the present Air Minister is so fully in agreement, read out a list of some 60 or 70 engines of different types, all of which have been in use since the beginning of the war, and most of which have been used quite recently in one way or another. Major Baird, in one of his usual displays of temper, gave him the lie direct, though as a matter of fact the list of types was extremely accurate.

If one could get at official figures one would probably find that one or more of all the types mentioned were still "on charge" within a very few months of the statement being made, so that the list was just about as nearly accurate as were the figures given by General Henderson at or around the time of the Air Enquiry Committee for the number of engines then "on charge," when certain critics alleged a shortage of engines. And it was very much more accurate than the figures given officially by Colonel Seely, as Minister for War, for the number of aeroplanes in flying condition—figures which were proved by Mr. Joynson-Hicks to have been falsified.

Shortly after this affair in the House, Major Baird, speaking at a gathering of important people concerned

with the aircraft supplies of our Allies, said, in his jaunty way, that he always recalled the advice of his former chief, Lord Cromer, "never to miss an easy one," and proceeded in self-glorification to relate how he had shortly before easily defeated a member of Parliament who had charged the Air Ministry with using "61 different types of machines." Now, please note that no reference had been made in the House to types of machines at all, but that by simply substituting the word "machines" for the word "engines." Major Baird put an entirely different aspect on the matter and represented himself as scoring heavily off his opponent.

If Major Baird pretends to have forgotten the incident, let me remind him of the occasion when, though a young man and a comparatively junior officer, he took it upon himself to rebuke the distinguished chairman for speaking of the Air Board instead of the Air Ministry, and proceeded to refer to himself immediately afterwards as "the representative of the Air Board." The *faux pas* was intensified by the presence at the same table of a voting member of the old Air Board—which Major Baird never was, being merely a Secretary—who was also a very highly-placed personage in the Air Council, so that Major Baird appeared somewhat presumptive in taking upon himself to speak in any other than his proper capacity.

None will be able to feel that justice can be done to the Air Minister's great work so long as he is misrepresented in the House of Commons. Though we live in an age of substitutes, a genteel man is no substitute for a gentleman as the representative of a Government department. A display of temper is no substitute for the exhibition of moral strength. Jauntiness and cheap attempts to score are no substitutes for wit and satire. And the manner and accent of a soldier as imagined by an exponent of a staged version of a Ouida novel are no substitutes for the genuine articles. Indubitably the Air Minister needs a representative in the House of Commons who is worthy of his high responsibilities to the King and his people.

The Task Inside the Air Ministry.

These matters affect Sir William Weir purely in his external work as Air Minister. But the internal affairs of the Air Ministry demand his attention no less than they did when he was Director-General of Aircraft Production. Possibly as Air Minister he may have more power to have his own way than he had as D.G.A.P.

Certainly the best way to obtain efficiency in the Hotel Bolo would be to burn the whole place down, being particularly careful not to salve any scrap of paper in it, and then start work afresh in an open field under canvas, where God's clean air could blow through everything.

The Technical Department in particular needs a thorough overhaul.

The Timber and Dope Scandals.

The first executions should take place among the people who are responsible, primarily for the shortage of timber generally and of spruce in particular, and secondly for the non-provision of proper substitutes and the passing of improper substitutes.

Then some disappearances might with advantage take place in the Dope Department, among the people who after bullying and irritating the hard-working dope manufacturers, all of whom have been doing very good work, have lately decided to use nothing but a standard dope. Experienced chemists state that this stuff will be practically worthless for its purpose, in that it will double the amount of work necessary to keep machines in order at the front, and will necessitate the redoping of all spares and machines kept in store at home for more than a few weeks before they are put into service.

The same people are apparently responsible for the entirely unnecessary use, and therefore the waste, of linseed oil in pigments for aeroplanes. One is under the impression that linseed is excellent feeding stuff for cattle and pigs, and that therefore they are wasting the nation's food. All the material necessary for pigments can be got out of what are now waste products from other war materials.

If the people in the dope and paint department do not know this they are not fit for their jobs. And if they do know it and allow the waste to continue, they are still less fit for their jobs.

An Official Photograph taken on the British Western Front in France.

A.I.D. Wastage.

One gathers that the Aeronautical Inspection Directorate is now under the D.G.A.P. and not, as one would think it ought to be, under the Controller-General of Equipment. In any case, the A.I.D. badly needs overhauling. There are many excellent people in it, and many of them do valuable work, but half the personnel would do still better work. The people who are responsible for all the ridiculous, time-wasting, labour-wasting "procedure" should be executed first. Those who are responsible for laying down absurd limits and so forth might perhaps be conceded the privilege of watching the others expire first.

Testing New Types.

A department which deserves something special in the way of executions, "something humorous with boiling oil in it," is that particular one which deals with the testing and choice of new machines. Instead of getting a test through in a matter of days and sending in a full and precise account of the performance, as the R.N.A.S. test station used to do, this department keeps machines hanging round literally for months before completing tests.

One knows at the moment of at least two machines specifically, both far superior to anything in use at the front at the moment, which have been in existence in their present form for between two and three months, and which by now, under any properly managed department, would be in production in quantities, and would be in use to quite a considerable extent by the R.A.F. in the field. Yet so far all this precious department has done is to play with them as if they were interesting scientific toys, turned out for the delectation of the university professors and budding investigators who seem to run the department.

A Grave Warning.

This department, whose identity and location cannot well be mistaken, has become as grave a menace to the active-service pilots and to the R.A.F.'s superiority in the air as was the Royal Aircraft Factory in the old days. One desires to warn the Air Minister and the Director-General of Aircraft Production, in all seriousness, that unless this department is completely reorganised and placed under the control of people who are more anxious to win the war than they are to enhance their private reputations as scientists, a most serious wrong will be done to the active-service pilots.

This warning is hereby recorded in print. *Litera scripta manet.* It will be available for reference in a year's time when the follies of the department will be bearing fruit if they are not stopped at once.

People who detach air-screw bosses with a hack-saw to save the trouble of undoing a few screws, and who keep a new-type machine fooling about in the air while they listen to its beautiful engine notes, instead of putting it through its tests and into production, are certainly not fit to be trusted with work of vital importance in war time. The same people have already, either from ignorance or from personal incapacity, damned at least two of the best machines which this country has ever produced. They have kept machines out of the quantity-production stage for months, with their pseudo-scientific buffoonery. They are definitely a menace to the active-service pilots, and their deleterious activities must be stopped, just as the Royal Aircraft Factory was stopped. And they must be stopped in a very much shorter time.

It took two years of war to make the R.A.F. innocuous. We cannot afford at this stage of the war to waste another two years in cleaning out the hangers-on of the Technical Department.

Good Wishes.

The Air Minister has begun his task under the most favourable possible auspices. We all expect great things of him. One hopes in all sincerity that he will maintain his high reputation, and that he will help the Royal Air Force to victory. One hopes, above all, that he will not, as in the notable example of a very distinguished officer, break himself through persisting in backing the wrong horses in spite of the warnings of those who wished him well.

Sir William Weir is a brave man to have taken on the job of Air Minister after seeing how easily Lord Rothermere was broken. It is, as a wise soldier of one's acquaintance remarked some time ago, far easier to break a Cabinet Minister than it is to break a general or a permanent official. One hopes therefore that the Air Minister will start by breaking all the inefficient officials below him, and will consolidate his own position among their débris.—C. G. G.

GENERAL TRENCHARD'S APPOINTMENT.

On May 2nd **Maj. Baird,** Parliamentary Secretary to the Air Board, asked by Mr. R. M'Neill what position in the Air Service was to be occupied by Sir Hugh Trenchard, and what were the duties of that position, said his right hon. friend was giving this matter his closest attention, but he was not yet in a position to authorise him to make a definite statement on this subject. He was engaged in reviewing the whole position of the Air Force, with the object of deciding what post would give the best scope for the utilisation of General Trenchard's great qualities. The hon. member would easily appreciate that a decision of this importance ought not to be rushed.

Mr. R. M'Neill: May we take that as an assurance that in this case we are not going to be put off, as in the case of Lord Jellicoe?

Maj. Baird: I really think that is not a fair thing to say about my right hon. friend. My right hon. friend has only just taken over office in this new force, and he must make himself conversant with it before he can be called upon to give a decision.

Mr. Chancellor asked whether it would not be necessary to invent or create some new position for General Trenchard.

Maj. Baird: No; decidedly not. Neither the Secretary of State nor General Trenchard would consent to any course of that kind.

WHO'S WHO IN OFFICIALDOM.

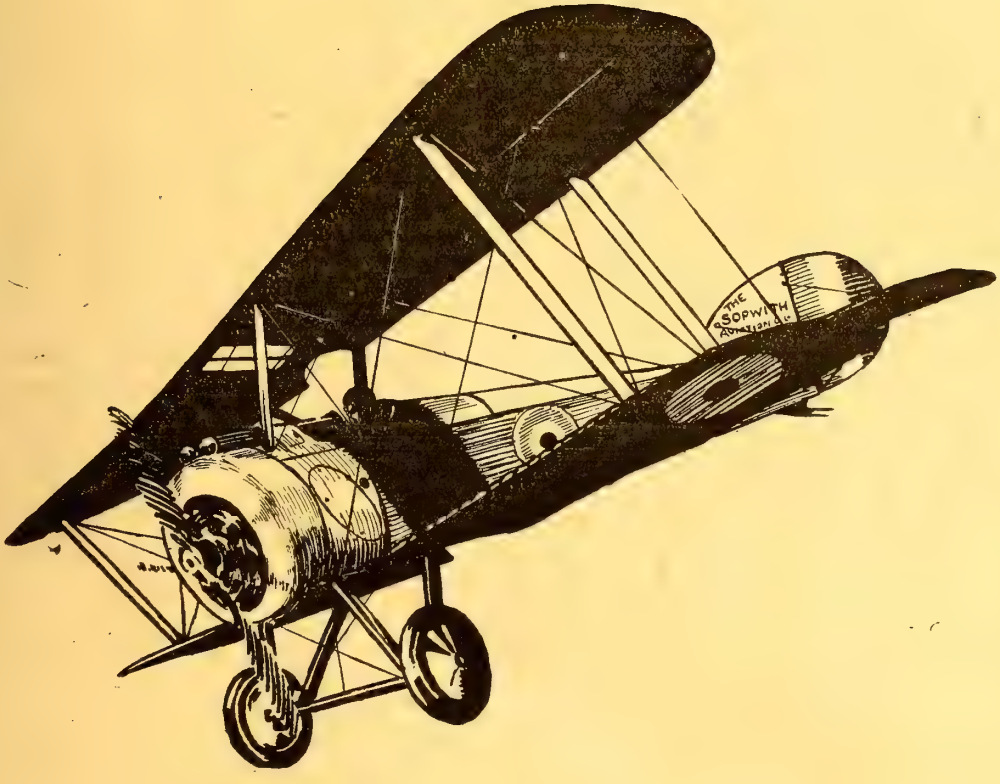
In answer to Mr. George Terrell, who asked the Minister of Munitions to furnish particulars of the 70 departments and the name of the chief official in charge of each, Mr. Kellaway gives a list of the principal departments and the names of the officials in charge, among which are the following:—

Finance Group.—Aircraft and Explosives Finance: Sir Philip Henriques, K.B.E., director.

Ordnance Group.—Controller, Timber Supplies: Mr. D. Bain, C.B.E.

Air Group.—Aircraft Production: Director-General, vacant owing to the appointment of Sir W. Weir as Air Minister; Assistant Director-General, Sir Henry Fowler, K.B.E. Controllers: Supply, Brig.-Gen. W. Alexander, D.S.O., and Technical, Lt.-Col. J. G. Weir, C.M.G.; Director, Inspection, Lt.-Col. R. K. Bagnall-Wild; Controller, American Assembly, Mr. Alexander Duckham.

Engines Group.—Controller, Mechanical Warfare, Vice-Adm. Sir A. G. Moore, C.V.O.; Commissioner, Mechanical Warfare (Overseas and Allies), Lt.-Col. A. G. Stern, C.M.G.; Director, Agricultural Machinery, Mr. H. C. B. Underdown; Controller, Machine Tools, Mr. E. M. Iliffe; Directors, Mechanical Transport, Lt.-Col. C. V. Holbrook, and Electric Power Supply, Mr. A. Gridley.



Labour Group.—Labour Regulation, Controller (ranking as an Assistant Secretary), Mr. H. Wolfe, C.B.E.; Directors, Labour Supply (Civil), Mr. T. M. Taylor, C.B.E.; Military, Mr. J. A. Barlow, C.B.E.; Labour, Adviser, Sir Thomas Munro, K.B.E.; Director-General, Lands (for War Office and Ministry of Munitions), Sir Howard Frank, F.S.I.; Chairman, Munitions Works Board, Mr. J. Carmichael, J.P.

A LOYAL ACKNOWLEDGMENT.

The following telegram published on May 6th has been received by the Queen from the Royal Air Force, Middle East:—

The Royal Air Force, Middle East, which includes all those who are serving with the Expeditionary Forces in Palestine, Egypt, Salonika, and Mesopotamia, and also the Australian Flying Corps in this theatre, desires to thank H.M. the Queen for her gracious message, which by its courage and sympathy inspires the determination of all.

A CERTIFICATE OF ACHIEVEMENT.

Officers relinquishing their commissions are to be eligible for a special certificate from the King. This concession, which is set out in an Army Order, applies to those discharged :—

(a) After service overseas in a theatre of war with an Expeditionary Force in the present war and who have been invalided on account of wounds or ill-health caused or aggravated by military service.

(b) On account of disablement certified, under the authority of the Army Council, to be directly attributable to the action of the enemy—e.g., air or naval raids.

(c) Previous to transfer to the R.F.C. or R.A.F., on account of disablement certified under the authority of the Army Council to have been caused or aggravated by military service while engaged on flying duty in connection with operations against the enemy other than in a theatre of operations.

The King has also approved the issue of a special certificate, to be entitled the King's Second Certificate, to officers who, after the award of the King's Certificate, voluntarily rejoin, and are again discharged in the same circumstances. Special certificates of discharge are to be issued to all warrant officers, N.C.Os, and men who have served since August 4th, 1914, and who have been discharged as no longer physically fit for war service. Ex-officers seeking the certificates should write to War Office (M.S.2C), 8, Bedford Square, W.C.1.

SIR HENRY NORMAN'S RESIGNATION.

On May 6th, replying to **Mr. P. A. Harris** (Harborough, L.), who asked whether Sir H. Norman had resigned his position on the Air Council; and, if so, what was the reason for his resignation, **Maj. Baird**, Parliamentary Secretary to the Air Council (Rugby, U.), said :—The reply to the first part of the question is in the affirmative. The right hon. baronet the member for Blackburn, having been appointed to the Air Council by the late Secretary of State, naturally placed his resignation in the hands of the new Secretary of State, who accepted it, having decided that it is desirable to reduce the size of the Air Council. The vacancy has not been filled.

THE AIR COUNCIL AND LAND.

An Order in Council has been made applying to the President of the Air Council with some modifications certain statutes which confer on the military authorities power to acquire, hold, and manage land for the Services under their control. The statutes dealt with include the Defence Acts, 1842, 1854, 1859, and 1860, the Ordnance Board Transfer Act, 1855, the Militia (Lands and Buildings) Act, 1873, and the Military Lands Act, 1892. The Order may be cited as the Air Force (Application of Enactments) (No. 1) Order, 1918.

THE WOMEN'S ROYAL AIR FORCE.

The Secretary of State for the Royal Air Force has appointed the Hon. Violet Douglas-Pennant to be Commandant of the Women's Royal Air Force, her services having been lent for the purpose by the chairman of the National Health Insurance Joint Committee.

Miss Douglas-Pennant, who was born in 1869, is the sixth daughter of the second Lord Penrhyn, and sister of the present peer. She has given proof of marked administrative ability as an Insurance Commissioner for Wales, a post which she has held since 1912.

A BAIRD BLUNDER.

From the "Morning Post" of May 6th :—

SIR,—It is a pity that our Ministers are sometimes so unfortunate in the way they express themselves. In the debate on Monday last the Under-Secretary to the Air Ministry is reported as having said that "the quality of pilots had steadily increased."

Those of us who know anything about it know that what he intended to convey was that the efficiency of our pilots had increased. This is due to the immense improvement in their training.

Two years ago—thanks to the neglect of our politicians of our preparation for war and to their dilatoriness after war began—our boys were sent to the front after just half the time for training that is given to them now. Owing to the shortage of pilots they were kept out there after they were due for a rest and for a term of home service. How many of these gallant boys of 18 and 19 threw their lives into the breach to make good our neglect to prepare an Air Service to meet that of our enemies?

It surely is not unreasonable that those who, by sad experience, know these things should expect from a Minister reviewing the present position of our splendid Air Force something better than words which can be taken to compare the quality of the present gallant pilots with the no less gallant ones who, alas! are mostly gone. The quality of the latter was the same; the improvement is in the way that the Government are now doing their duty by their successors.—Yours, etc.,

May 4th. N. S.

NAVAL SERVICE CHEVRONS.

The Secretary of the Admiralty has made an announcement with regard to the conditions of the award to members of the Royal Navy and the other marine services of chevrons for service at sea or oversea.

Chevrons will be awarded to denote services oversea or at sea undertaken since August 4th, 1914, and are to be worn in uniform. Applications and correspondence from serving officers and men with regard to chevrons are not to be addressed direct to the Admiralty, but are to be dealt with by their commanding officers in the first instance.

The following among others will be eligible for the award subject to the conditions laid down :—

Officers and men of the Royal Naval Air Service up to April 1st, 1918.

Service oversea and at sea is defined as follows :—

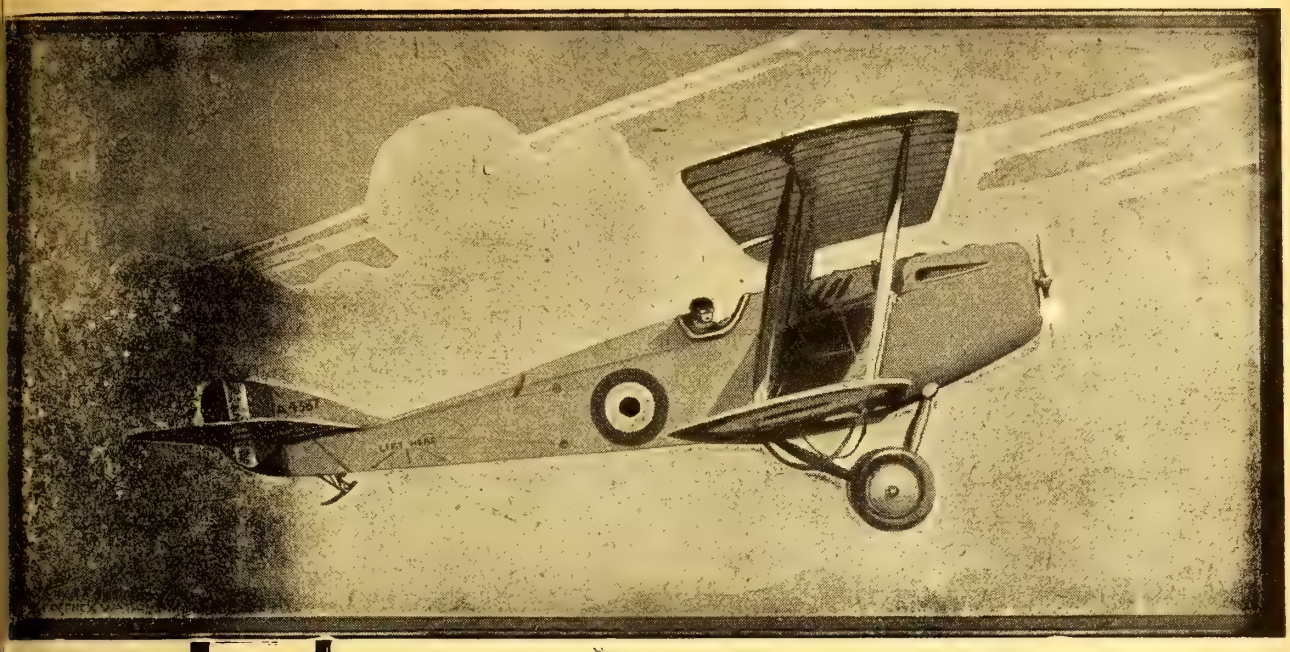
Service at sea is service in sea-going ships of war and auxiliaries, it does not include service in hulks and harbour vessels, nor in harbour craft which are tenders to such vessels, except in those which are employed in minesweeping.

Officers and men of the late Royal Naval Air Service who, although serving in the United Kingdom, were liable for service in the air for offensive or defensive purposes, may count such service as qualifying service. Service in kite balloons when embarked in ships will also count.

The date for the award of the first chevron will be August 5th, 1914, in the case of those serving at sea or abroad on that date, and in other cases the date on which the individual began or begins qualifying service as defined—for example, an individual who began qualifying service on Dec. 31st, 1915, is entitled to his first chevron on that date. In the case of officers and men of the Naval Forces of the Dominions the date will be the date of being drafted to a seagoing ship or leaving their own country.

Additional chevrons are to be awarded as follows :—

(a) From Jan. 1st, 1915, to Dec. 31st, 1917, inclusive, on a calendar year basis; that is, one chevron and not more than one for each of the years 1915, 1916, and 1917. The individual must have an aggregate of three months' qualifying service in the calendar year to entitle him to the award for that year. An additional chevron is not to be given for the calendar year in which the first chevron is awarded. Service cannot be added from one calendar year to another. Periods in prison, detention or in captivity as a prisoner of war are not to count towards the three months' qualifying service. Note.—Should an individual have been wounded on active service and not have the necessary three months' qualifying service for the calendar year in which he was wounded, he is, nevertheless, to be awarded the chevron for that year, subject, however, to the condition that more than one chevron cannot be obtained in any one calendar year.



(b) From Jan. 1st, 1918, onwards, one chevron for each successive aggregate period of 12 months' qualifying service. This service need not be continuous. It will include short periods of leave where the individual returns to service at sea or overseas at the conclusion of such leave. Periods of absence without leave, in prison or detention, in hospital from sickness due to avoidable causes, or in captivity as a prisoner of war are to be excluded in calculating the 12 months required to qualify for an additional chevron. Note.—No service prior to Jan. 1st, 1918, is to count towards the 12 months' qualifying service.

The chevrons will be ½in. in width, the arms 1½in. long. They will be worn inverted on the right forearm. Chevrons for officers will be of silver or gold braid. The first chevron, if earned on or before Dec. 31st, 1914, will be silver; if earned on or after Jan. 1st, 1915, it will be gold, and all additional chevrons after the first will be gold. The silver chevron will be worn below the gold one. For ratings they will be of worsted embroidery of two colours—red and blue. The first chevron, if earned on or before Dec. 31st, 1914, will be red; if earned on or after Jan. 1st, 1915, it will be blue; and all additional chevrons after the first will be blue.

In the case of officers they are to be worn on the blue undress coat only.

The chevrons are a distinction to be worn on uniform to denote service at sea or overseas since the outbreak of war, and are not to be regarded as being in the nature of a reward. There will, therefore, be no posthumous award to fallen officers or men. The chevrons may be worn in plain clothes by officers and men who have left the Service, but who would, had they remained in the Service, have been entitled to wear them on uniform. In such cases, application for authority to wear the chevrons must be made.

It is an offence under the Defence of the Realm Regulations for any unauthorised person to wear a chevron or chevrons, and it should be noted that under Regulation 41, sub-paragraph (c), it is an offence for any person to supply, without lawful excuse or authority, one of these chevrons to an unauthorised person.

NOTE.—The ranks and ratings of officers and men given above are those which they held on Dec. 31st, 1917.

WAR OFFICE, May 1st.

REGULAR FORCES—ESTABLISHMENTS—R.F.C.—MIL. WING.—Gen.List.—G. F. Whitmore, late temp. Maj., to be temp. Maj., Nov. 19th, 1917.

* * *

The King has been pleased to award the Distinguished Conduct Medal to the following for gallantry and distinguished service in the Field:—

21479 1st Cl. Air Mech. S. W. EGAN, R.F.C. (Catford, S.E.)

CORRIGENDUM.—The following name should read as now stated and not as previously published:—King, Lt. W. J., N. Staff. R. and R.F.C.

AIR MINISTRY, May 1st.

The King has been pleased to award the Victoria Cross to the following Officers of the R.A.F., for services displaying outstanding bravery:—

Lt. ALAN JERRARD, R.A.F. (formerly of the S. Staff. R.).

When on an offensive patrol with two other officers he attacked five enemy aeroplanes and shot one down in flames, following it down to within 100 ft. of the ground.

He then attacked an enemy aerodrome from a height of only 50 ft. from the ground, and, engaging single-handed some 19 machines, which were either landing or attempting to take off, succeeded in destroying one of them, which crashed on the aerodrome. A large number of machines then attacked him, and whilst thus fully occupied he observed that one of the pilots of his patrol was in difficulties. He went immediately to his assistance, regardless of his own personal safety, and destroyed a third enemy machine.

Fresh enemy aeroplanes continued to rise from the aerodrome, which he attacked one after another, and only retreated, still engaged with five enemy machines, when ordered to do so by his patrol leader. Although apparently wounded, this very gallant officer turned repeatedly, and attacked single-handed the pursuing machines, until he was eventually overwhelmed by numbers and driven to the ground.

Lt. Jerrard had greatly distinguished himself on four previous occasions, within a period of 23 days, in destroying enemy machines, displaying bravery and ability of the very highest order.

Sec. Lt. ALAN ARNETT MCLEOD, R.A.F.

Whilst flying with his observer (Lt. A. W. Hammond, M.C.), attacking hostile formations by bombs and machine-gun fire, he was assailed at a height of 5,000 ft. by eight enemy triplanes, which dived at him from all directions, firing from their front guns. By skilful manœuvring he enabled his observer to fire bursts at each machine in turn, shooting three of them down out of control. By this time Lt. McLeod had received five wounds, and whilst continuing the engagement a bullet penetrated his petrol tank and set the machine on fire.

He then climbed out on to the left bottom plane, controlling his machine from the side of the fuselage, and by side-slipping steeply kept the flames to one side, thus enabling the observer to continue firing until the ground was reached.

The observer had been wounded six times when the machine crashed in "No Man's Land," and Sec. Lt. McLeod, notwithstanding his own wounds, dragged him away from the burning wreckage at great personal risk from heavy machine-gun fire from the enemy's lines. This very gallant pilot was again wounded by a bomb whilst engaged in this act of rescue, but he persevered until he had placed Lt. Hammond in comparative safety before falling himself from exhaustion and loss of blood.

WAR OFFICE, May 2nd.

REGULAR FORCES.—ESTABLISHMENTS.—R.F.C.—MIL. WING.—Sqdn. Comdr.—Lt. (temp. Capt.) J. McKelvie, R.E., T.F., from a Flt. Comdr., and to be temp. Maj. while so empld., March 11th.

Flt. Comdr.—Lt. T. P. Middleton, R.F.A., T.F., from a Flying Officer, and to be temp. Capt. while so empld., March 30th.

Park Comdrs.—From Equipt. Officers, 1st Cl., and to be temp. Majs. whilst so empld.:—Lt. (temp. Capt.) J. E. Rendle, Spec. Res., Feb. 15th; Lt. (temp. Capt.) H. R. Lecomber, Spec. Res., Feb. 28th; Sec. Lt. (temp. Capt.) L. Auker, Gen. List, March 9th; Lt. (temp. Capt.) G. Somers-Clarke, Spec. Res., March 31st.

Gen. List.—Actg. Cpl. D. S. Nicol, from R.F.C., to be temp. Sec. Lt., Feb. 25th.

WAR OFFICE, May 3rd.

REGULAR FORCES—ESTABLISHMENTS—R.F.C.—MIL. WING.—Asst. Instr. in Gunnery (graded as an Equipt. Officer, 2nd Cl.)—Lt. R. R. MacGregor, R. Scots, T.F., from M.G. Corps, Sept. 18th, 1918.

Experimental Officer, 3rd Cl.—Graded as an Equipt. Officer, 3rd Cl.—Temp. Sec. Lt. (on prob.) A. Spring, Gen. List, and to be confirmed in his rank, Feb. 20th.

SCHOOLS OF INSTRN.—SCHOOLS OF MIL. AERONAUTICS.—Instr. in Gunnery.—Graded as an Equipt. Officer, 1st Cl.—Temp. Lt. R. C. Nicholls, Gen. List, from an Asst. Instr. in Gunnery (graded as an Equipt. Officer, 2nd Cl.), and to be temp. Capt. while so empld., Feb. 1st.

Gen. List.—Lt. R. R. MacGregor, R. Scots, T.F., to be temp. Capt. while specially empld., Dec. 10th, 1917.

To be temp. Sec. Lts.—3rd Cl. Air Mech. R. Musgrave, from R.F.C.; 3rd Cl. Air Mech. J. E. Atkinson, from R.F.C., Jan. 4th; 3rd Cl. Air Mech. R. Sykes, from R.F.C.; Flt. Serjt. H. H. Wright, from R.F.C., Feb. 2nd.

AIR MINISTRY, May 3rd.

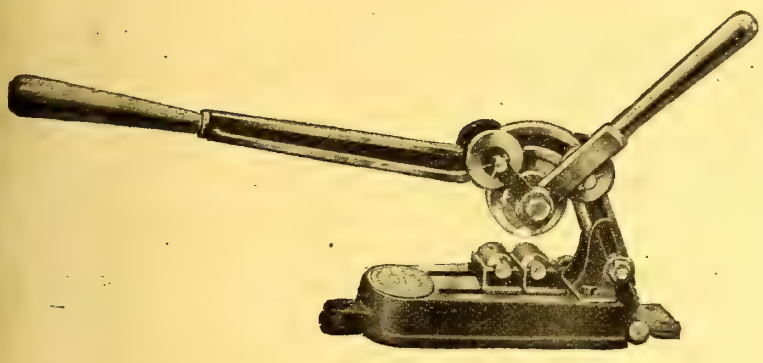
R.A.F.—The follg. temp. appts. are made at the Air Ministry:

Deputy Controller-General of Equipt.—A. Huggins, D.S.O. (Bt. Maj. in Army), is transfd. to R.A.F., and is granted a temp. commn. as Lt.-Col., and to be temp. Brig.-Gen. while so empld., Feb. 18th (substituted for notification in "Gazette" of March 22nd).

Staff Officer, 2nd Cl.—Lt. (temp. Capt.) L. Reynolds, and to be temp. Maj. while so empld., April 3rd.

Staff Officer, 3rd Cl. (unpaid).—Temp. Hon. Capt. B. S. Cohen, April 1st (substituted for notification in "Gazette" of April 2nd.

The follg. temp. appts. are made:—



Area Comdrs.—Maj.-Gen. M. E. F. Kerr, C.B., M.V.O.; F. C. Heath-Caldwell, C.B. (Maj.-Gen. in Army), and is granted a temp. commn. as Maj.-Gen.; Hon. Sir F. Gordon, K.C.B., D.S.O. (Maj.-Gen. in Army), and is granted a temp. commn. as Maj.-Gen.; G. C. Cayley, C.B. (Rear-Adm. in R.N.), and is granted a temp. commn. as Maj.-Gen.; Lt.-Col. (temp. Maj.-Gen.) C. A. H. Longcroft, D.S.O., and to retain his temp. rank while so empld., April 1st.

Brig. Comdr.—Lt.-Col. (temp. Brig.-Gen. in Army) T. C. R. Higgins, April 1st.

Group Comdrs. (and to be temp. Brig.-Gens. while so empld. if not already holding that rank).—Lt.-Col. (temp. Brig.-Gen. in Army) J. H. W. Becke, D.S.O., Lt.-Col. (temp. Brig.-Gen.) H. D. Priggs, Lt.-Col. E. L. Gerrard, Lt.-Col. (temp. Brig.-Gen.) C. L. Lambe, C.M.G., D.S.O., Lt.-Col. H. P. Smyth-Osbourne, Lt.-Col. J. M. Steel, Lt.-Col. (temp. Brig.-Gen. in

E.103.

Another BLACKBURN Idea

for better and quicker work—

THE BLACKBURN PATENT

MARKING MACHINE

Stamp your identification or trade mark, on all the work you turn out, with the Blackburn Marking Machine. It is strongly built, will hold four dies which are of standard size and interchangeable. The Blackburn Marker is indispensable in your inspection department, being more convenient and handier than the old kinds of markers and in every way a superior machine. With a Blackburn Marker you can stamp any kind of metal—*e.g.*, tubes, bolts, pins, turnbuckles, fork-ends, etc.—which could not be marked in the ordinary way.

Variety of Shapes and Parts suitable for Stamping with the Blackburn Marker.

Price and further particulars on application direct to:

S.O., 3rd Cl. (and to be temp. Capts. while so empld. if not already holding that rank).—Lt. (Hon. Capt.) J. Andrews, Lt. (Hon. Capt.) J. M. Bell, D. L. Blumenfeld (Lt. in Army, T.F.), and is granted a temp. commn. as Lt., Capt. W. D. Budgen, Lt. H. W. Eaton, Lt. (Hon. Capt.) P. Ellis, Lt. (Hon. Capt.) R. R. Prentice, J. L. Robertson (Capt. in Army), and is granted a temp. commn. as Capt. Lt. S. T. Smith, Capt. B. D. S. Tuke (April 1st); Lt. (temp. Capt.) R. L. Kennedy (April 8th); Capt. F. J. Wise (April 9th); Lt. Hon. Capt. J. A. Carr, D.S.C. (April 10th); Lt. G. R. McCubbin, D.S.O. (April 11th); Lt. (temp. Capt.) E. J. Wickens (April 23rd).

E. L. Ellington, C.M.G. (Bt. Col. (temp. Brig.-Gen.) in Army), is granted a temp. commn. as Col., and to be temp. Maj.-Gen. while specially empld. (April 10th).

Col. F. R. Scarlett, D.S.O., to be temp. Brig.-Gen. while empld. as Dir., Air Division, at the Admiralty (April 1st).

Col. (temp. Brig.-Gen.) A. V. Vyvyan, D.S.O., to retain his temp. rank while seny. R.A.F. Officer under the Commander-in-Chief, Mediterranean (April 17th).

Flying Branch.—Maj. A. V. Holt to be temp, Lt.-Col. while empld. as Lt.-Col. (Flying) (April 21st).

Capt. K. F. Balmain to be temp Maj. while empld. as Maj. (Flying) (April 21st).

Lt. G. C. Twining to be temp. Capt. (but without the pay and allowances of that rank) while specially empld. (April 1st).

Lts. to be temp. Capts. while empld. as Capts. (Flying).—(Hon. Capt.) F. Lindsay, I. H. P. McEwen (April 1st); F. A. Nicholson (April 3rd); D. G. Cooke (April 11th); G. O. Johnson (April 12th); (Hon. Capt. S. W. Vickers (April 19th); J. V. Sorsoleil, M.C. April 20th); H. C. R. Owen (April 21st); G. G. Walker (April 26th).

The following are granted temp. commns. as Sec. Lts.—Serjt. (Pilot) H. N. Lee, Serjt. (Pilot) C. L. Startup (April 29th).

Lt. W. J. G. Armiger relinquishes his commn. on account of ill-health contracted on active service (May 4th).

Lt. (Lt. Can. Local Forces) H. K. Black relinquishes his commn. on ceasing to be empld. on acct. of ill-health (May 4th).

Lt. (Lt., S. Staffs, Spec. Res.) F. P. Blencowe relinquishes his commn. on ceasing to be empld. on acct. of ill-health contracted on active service (May 4th).

Lt. (Lt. Can. Local Forces) W. W. Boyd relinquishes his commn. on ceasing to be empld. (May 4th).

Lt. D. W. Dawson resigns his commn. to resume his medical studies (May 4th).

Lt. W. T. Grieves resigns his commn. (May 4th).

Lt. R. K. MacKenzie resigns his commn. (May 4th).

Lt. C. P. Vivian relinquishes his commn. on acct. of ill-health contracted on active service (May 4th).

Sec. Lt. B. St. J. H. Atteridge relinquishes his commn. on acct. of ill-health contracted on active service (May 4th).

Sec. Lt. M. Benjamin relinquishes his commn. on acct. of ill-health (May 4th).

The notification in the "Gazette" of April 19th concerning Maj. (temp. Lt.-Col.) R. R. Smith-Barry is cancelled.

Administrative Branch.—W. B. Armitage (temp. Maj. in Army) to be Capt. (Hon. Maj.) (April 13th).

H. Perry (temp. Capt. in Army) is granted a temp. commn. as Maj. (April 15th).

Capt. J. L. Luntley relinquishes the temp. rank of Maj. on reversion to Admin. Capt. (April 26th).

Lt. B. D. Bellamy, from a Staff Officer 4th Cl., to be Admin. Lt. (April 26th).

Capt. (temp. Maj.) Hon. M. Baring, from a Staff Officer, 2nd Cl., to retain his temp. rank while empld. as Admin. Maj. (April 27th).

Sec. Lt. G. Ryall to be temp. Lt. while empld as Admin. Lt. (April 29th).

J. H. Wright (temp. Lt. in Army) to be temp. Sec. Lt. while empld. as Admin. Sec. Lt. (April 29th).

G. H. Carbutt (Midshipman, R.N.) is granted a temp. commn. as Sec. Lt. (April 1st).

Cadets are granted temp. commns. as Sec. Lts.—E. J. A. Prosser, C. E. Taylor, W. Waddingham (April 3rd); R. L. Burdon-Sanderson (April 6th); C. H. Allen, E. S. Bale, H. C. S. Drake, J. S. Houston, W. C. Ingleby, A. A. Jackson, L. W. Killeen, L. T. Lawrence, H. W. T. Lewis, R. G. Maclean, J. McCormack, E. P. Nickless, J. L. Ure, W. E. G. Wallace, G. Wayman, A. L. Wright (April 8th); F. Mycock, from A.O.C., Serjt. H. F. Tattersall (April 9th); T. D. H. Bruce (April 14th).

Cadets are granted temp. commns. as Sec. Lts.—K. R. Bennie, W. R. H. Gateshill, H. D. Giblett, W. G. Hines, H. G. Johnston, C. G. Martin, J. T. McDougall, A. L. Muir, 1/A.M. (A./Cpl.) E. S. Osborn, H. Plackett, G. R. Robinson, C. J. Sear, G. C. Shakespeare, W. G. Smith, K. M. Stewart, K. L. Vernon, S. T. Westcott (April 15th); 1/A.M. F. J. Horman-Fisher (April 20th); Ldg. A./C. B. U. Wood (April 23rd); D. L. C. Evans, A. J. Maguire, H. Varney, Aircraftsman R. O. Cook, Ldg. A./C. A. B. Goodman, 1st A/C. C. C. Ham, 3rd Writer T. F. Kingston, Cadet F. B. Morris (April 24th); Cpl. W. T. Bodger (April 28th); 2/A.M. A. R. Deacon, Cpl. C. J. Skidmore-Jones (April 29th); Cadet A. M. Falconer (May 1st).

Technical Branch.—Lt. (temp. Capt.) W. W. Stenning to be temp. Maj. while empld. as (Tech.) Maj. (April 24th).

J. G. Connell (Lt. in Army, T.F.) is granted a temp. commn. as Lt. (April 15th).

Sec. Lt. A. G. Cardwell to be temp. Lt. while empld. as Lt. (Tech.) (April 13th).

J. N. Longfield (temp. Lt. in Army) to be temp. Lt. while empld. as Lt. (Tech.) (April 15th).

Sec. Lt. E. B. Crampton relinquishes his commn. on account of ill-health (May 4th).

Medical Branch.—R. P. Williams, from temp. Capt., R.A.M.C., is granted a temp. commn. as Capt. (April 22nd).

War Office, May 4th.

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing.—Flt. Comdrs.—From Flying Officers.—Lt. R. D. Baker, Canadian Local Force, and to be temp. Capt. while so empld., March 1st.

Capt. J. W. Pain, Suff. R., T.F., March 29th.

Adjt.—Capt. C. P. L. Firth, Worc. R., Spec. Res., and to be secd., Jan. 1st.

Gen. List.—The follg. to be temp. Sec. Lts:—Cpl. D. W. Lang, from S. Afr. F.C.; Cpl. W. Hornby, from S. Afr. F.C.; 3rd Cl. Air Mech. G. H. Kernick, from R.F.C.; 3rd Cl. Air Mech. H. V. Evans, from R.F.C.; 2nd Cl. Air Mech. R. S. Brophy, from S. Afr. F.C.; 2nd Cl. Air Mech. A. V. Bickley, from S. Afr. F.C.; 2nd Cl. Air Mech. A. D. Hegan, from R.F.C., Feb. 11th; 3rd Cl. Air Mech. R. H. Bond, from R.F.C., Feb. 12th; Actg. Cpl. R. Lane, from R.F.C.

Memoranda.—R. J. Bray to be temp. hon. Capt. whilst empld. as Inspr. Aeronautical Prodn. Dept., March 20th. Flt. Serjt. M. W. Piercey, from R.F.C., to be Sec. Lt. for service with R.F.C., March 27th.

AERONAUTICAL ENGINEERING
SUPPLEMENT TO "THE AEROPLANE"
INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

THE FRIEDRICHSHAFEN BOMBING BIPLANE.

A Report issued by the Technical Department of the Department of Aircraft Production, Ministry of Munitions.

This machine, which bears the mark F.D.H. G.3. 326/17, was brought down by anti-aircraft fire at Isbergues on the night of February 16th. A shell made a direct hit on the right-hand engine at a height of 8,000 to 9,000 feet, after which the machine covered about six miles and made a fairly good landing.

Various parts of the structure bear different dates, that on the tail being 14/1/18. The main spars are branded with a small crown and the letters Z.A.K. The following is painted on the side of the body :—

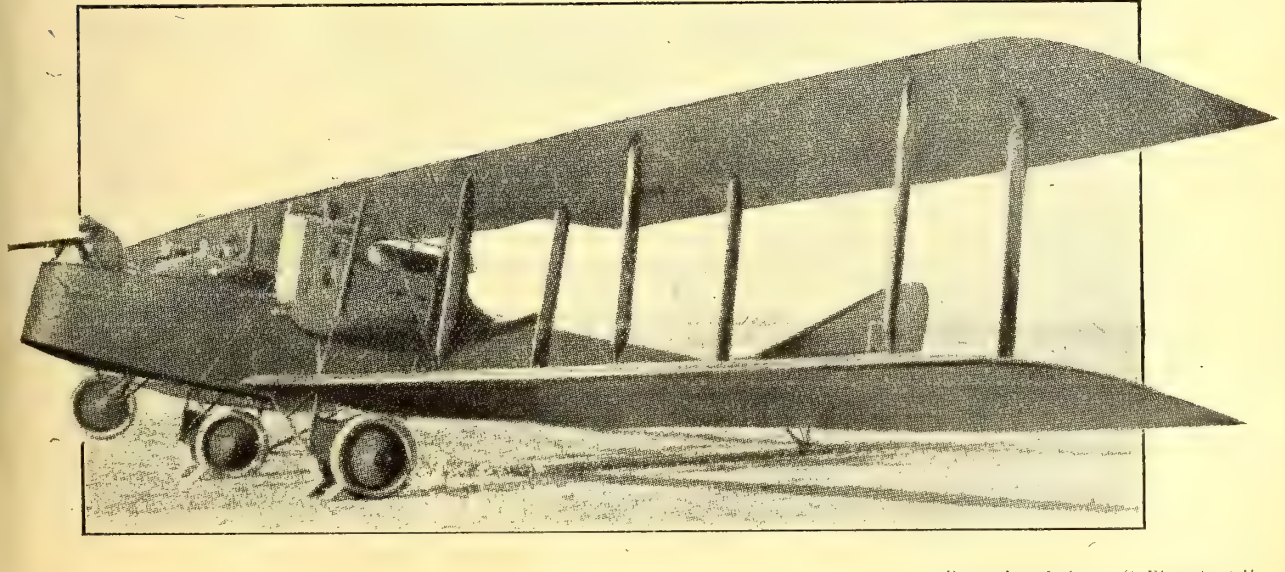
Leergewicht (weight empty), 2,695 kilogrammes = 5,929 lbs.
Nutzlast (useful load), 1,235 kilogrammes = 2,717 lbs.
Zulassiges Gesamtgewicht (permissible total weight), 3,930 kilogrammes = 8,646 lbs.

Crew.

This machine carried its full complement of four persons, namely, pilot, fore-gunner, after-gunner, and bomber. It is known, however, that the number of crew varies considerably, as some machines of this type have only carried two persons. The accommodation is so arranged that the personnel can easily change places, all the cockpits being intercommunicating.

General Description.

The general design of the machine is shown in the attached drawing, which gives plan and front and side elevations.

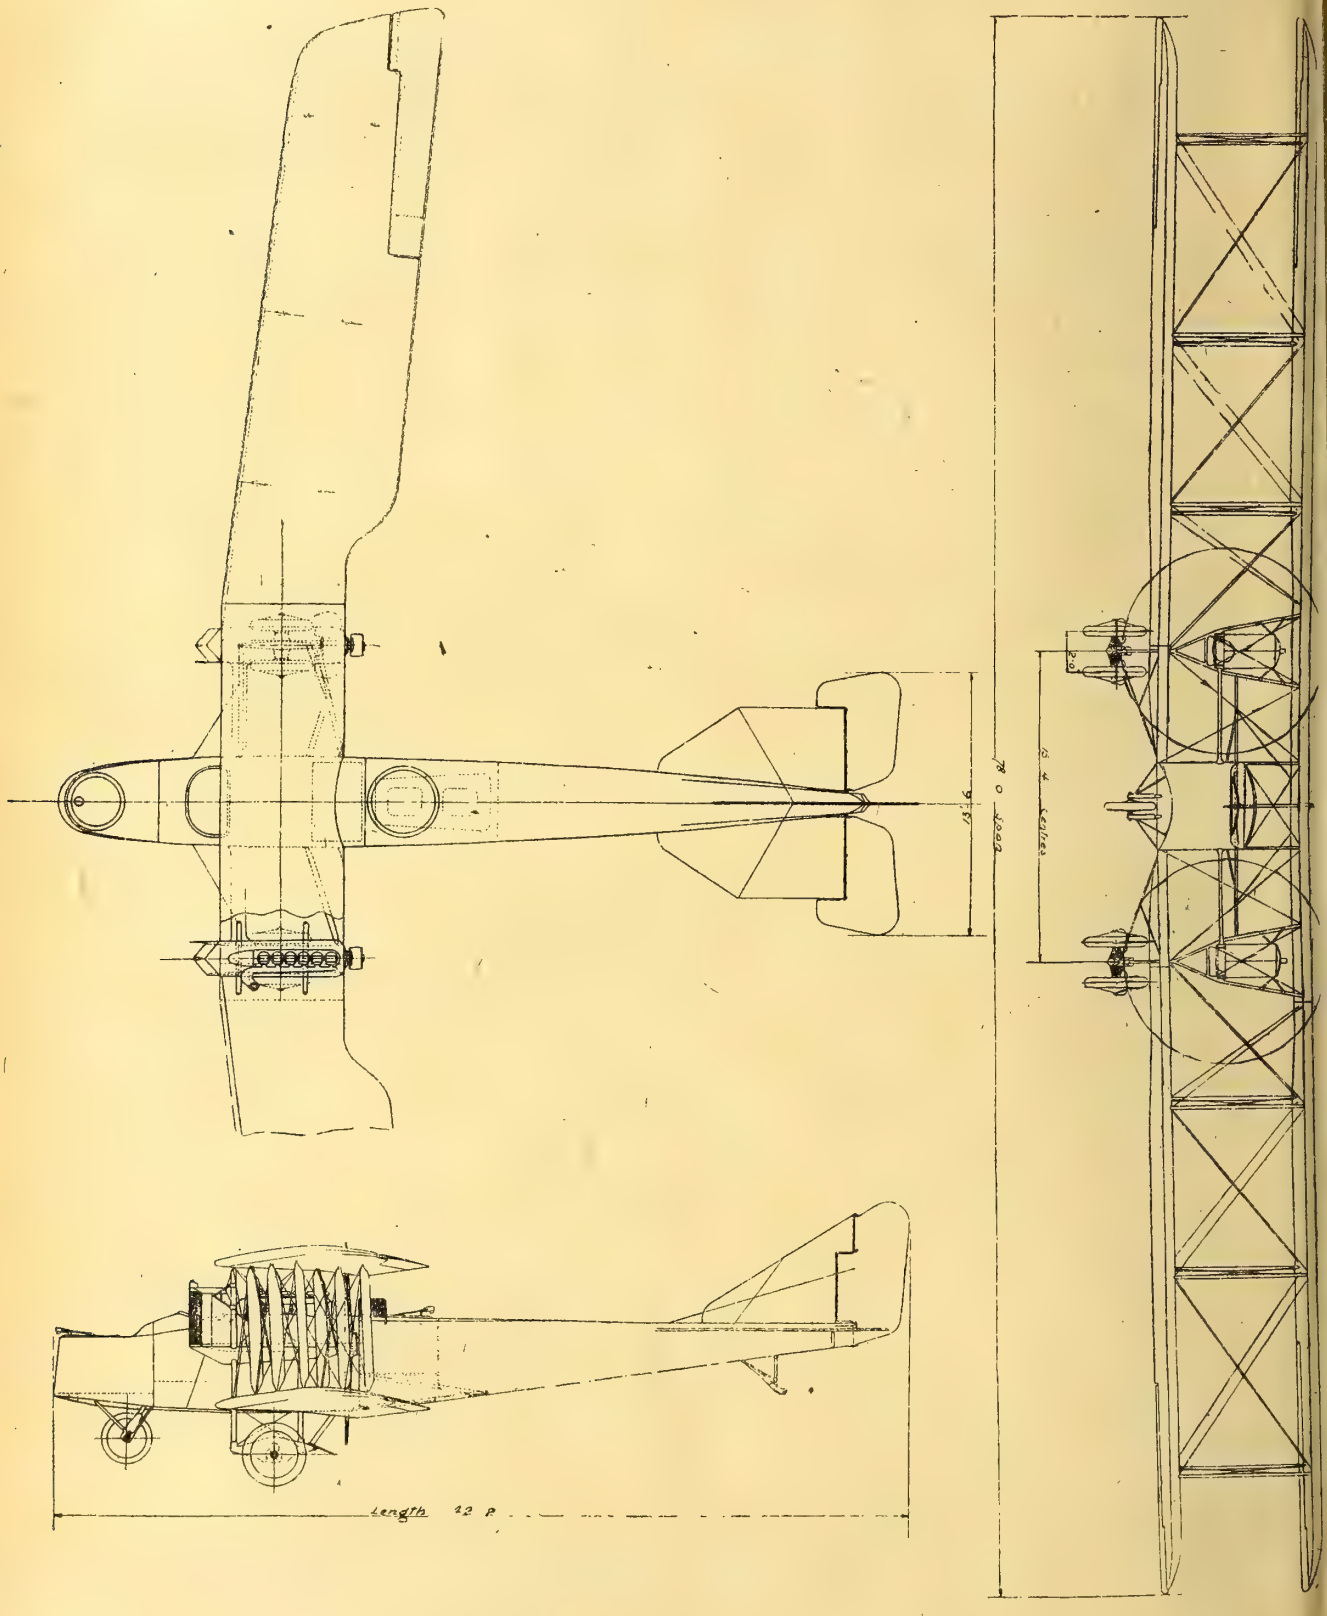


The principal dimensions are as follows :—

Span	78 ft.
Maximum chord	7 ft. 8 in
Gap	7ft.
Dihedral angle in the vertical plane	$1\frac{1}{2}^{\circ}$
Dihedral angle in the horizontal plane	6°
Total area of main planes	934.4 sq ft.
Area of upper main planes without flap	480 ,,
Area of lower main planes without flap	454.4 ,,
Load per square foot	9.24 lbs
Weight per horse power	16.6 lbs
Area of flap of upper wing	21.6 sq. ft.
Balance area	1.8 ,,
Area of flap on lower wing	16 ,,
Balance area	1.56 ,,
Total area of fixed tail planes	57.6 ,,
Total area of elevators	32 ,,
Balance area of one elevator	1.7 ,,
Area of fin	20 ,,
Area of rudder	19.2 ,,
Balance area of rudder	3 ,,
Maximum cross section of body	19.2 ,,
Horizontal area of body	133 ,,
Vertical area of body	131.2 ,,
Length overall	42 ft.

The machine is built up upon a central section, to which are attached the forward and rearward portions of the fuselage and the main planes. This central section comprises the main cell or cabin of the body, containing the tanks, bombs, etc. It also embraces the engines and the central portion of the upper and lower planes. The latter, together with the engine struts, are largely built up of steel tube, as is also the landing gear.

The central portion of the body, which measures 4ft. across by 4ft. 3in. in height, consists of a box formation made of ply wood, strengthened by longerons and diagonals, and transversely stiffened by ply-wood bulkheads. The bulkhead farthest forward acts as an instrument board, behind which are side by side the seats of the pilot and his assistant. The former has a fixed upholstered seat, whilst that of the latter is folding, consisting of a light steel tubular framework with a webbing backrest.



Underneath these two seats is the lower main petrol tank. Behind this cockpit the body is roofed in with ply wood, the rear part of which roofing is detachable so as to give access to the second main petrol tank, which is at the rear end of the main body section. By this means a small cabin or covered

DETAILS OF FRIEDRICHSHAFEN. CONSTRUCTION.

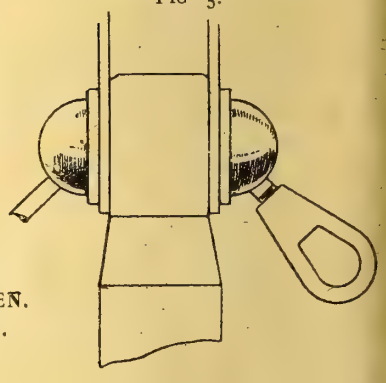

Fig. 8.

passage-way is provided, at each side of which are the racks for the smaller bombs.

Central Portion of Wings.

The central and non-detachable portion of the upper plane has a span of 19ft. 5in., whilst at each side of the nacelle the lower plane fixed portion measures 7ft. 8in. The main wing spars in this central portion are of steel tube, roughly 2in. in diameter, with a wall thickness of 1-16in.

These spars are braced by steel tubes arranged in the form of an X, the manner in which the bracing tubes are attached to the main spars being shown in the sketch Fig. 1.

The lugs are built up by welding, and are pinned and riveted in position, the joint being of the plain knuckle type.

The upper surface of the lower plane is, so far as the central section is concerned, covered in with three-ply wood.

In this portion the main ribs are of three-ply, with spruce flanges. Between each main rib is a cut-away rib, the design of which is shown in the sketch Fig. 2. This, unlike the main ribs, is one piece of wood, and not built up. For the greater part of its length it applies to the top surface only, being cut away to pass clear of the cross bracing tubes.

The plane is further stiffened with transverse members consisting of three-ply panels between each rib strengthened by grooved pieces top and bottom. The latter are attached as shown in the sketch Fig. 3, and the attachment of the flanges of the main ribs is shown in Fig. 4.

The central section of the upper main plane is in one piece and is covered top and bottom with fabric. In order to facilitate the removal of the engines, detachable panels measuring 1ft. 11½in. long by 1ft. 8in. deep are let into the trailing edge immediately over the engine bearers. These panels are socketed in front, and at the rear are joined up at the trailing edge with U section sheet steel clips and bolts.

The struts which connect the top of the nacelle to the upper plane are tubular and of streamline section, as are also the engine bearer struts. A section of one of the latter is given in Fig. 5. The thickness of the wall is one-sixteenth of an inch.

The method of attaching the lower end of the engine struts to the tubular steel spars is shown in the sketch Fig. 6, from which it will be seen that a welded Y socket is used and secured by a pin joint, the ends of the pin acting as anchorages for the attachment of the bracing wires.

This sketch also shows the lugs which respectively support the detachable portion of the main planes and the vertical strut of the landing chassis. The engine bearer struts are pushed into the Y socket and pinned in position, the pins being afterwards brazed into the socket. At their upper ends the engine struts are fixed to the top plane spars with pin joints, as shown in Figs. 7 and 8, the attachment differing according to the number of wire bracings that are to be taken to each joint.

Construction of Wings.

The detachable portions of the wings are fixed to the centre section by pin joints, one part of which is shown in Fig. 6, the male portion being represented in Fig. 9. The chord of the wing in the line of flight varies from approximately 7ft. 8in. to 7ft. 5in., and the wing section is shown shaded in Fig. 10. In order to provide a basis of comparison the R.A.F. 14 wing section is superimposed and drawn to the same scale.

The main spars are placed one metre apart, the front spar being 272 mms. in the rear of the leading edge. Both spars are of the built up box type, as shown in Figs. 11 and 12. The former is the leading spar and the latter the rear spar. These spars are of spruce, and each half is furnished with several splices, so that the greatest single length of timber in them is not more than 14ft. The splices, which occur in each half alternately, are of the plain bevel type about 15in. long and wrapped with fabric. A fabric wrapping is also applied at short intervals along the spar.

Internal cross bracing between the main spars is afforded by steel tube cross members and cables attached as shown in the sketch Fig. 9.

The main spar joint consists of a steel plate 19 mms. thick embedded in the spar end and held in position by 5 bolts, which pass through a strapping plate surrounding the end of the spar. This plate also carries the attachment for the bracing cable and is furnished with a spigot which locates the bracing tube. It will be seen that at this point the spar is provided with tapered packing pieces of hard wood glued and held in position by fabric wrapping.

The main ribs are placed 360 mms. apart. Between them are auxiliary formers, consisting of strips of wood 20 mms. × 10 mms. thick, which run from the leading edge to the rear spar. The main ribs consist of ply wood webs socketted into grooved spruce flanges, which are tapered off as shown in Fig. 4, except where they are met by a longitudinal stringer. The leading edge is solid wood moulded to a semi-circular section of approximately 65 mms. diameter. Where the rib web abuts against it, packing pieces are glued each side. Between the main spars the web of the rib is divided by three vertical strips into four panels and in each of these it is perforated, leaving an edge all round about 72 mms. wide.

As shown in Fig. 9, the upper flange of the main ribs is carried clear of the leading spar by means of packing pieces. In the case of the rear spar, packing pieces are also used under the rib flange as shown in Fig. 12.

The lower main planes for a width of about 2ft. 3in. at their inner end are covered as to their top surfaces with three-ply wood.

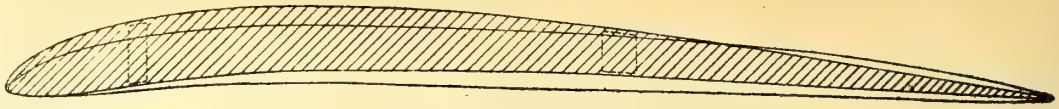

Fig. 10.

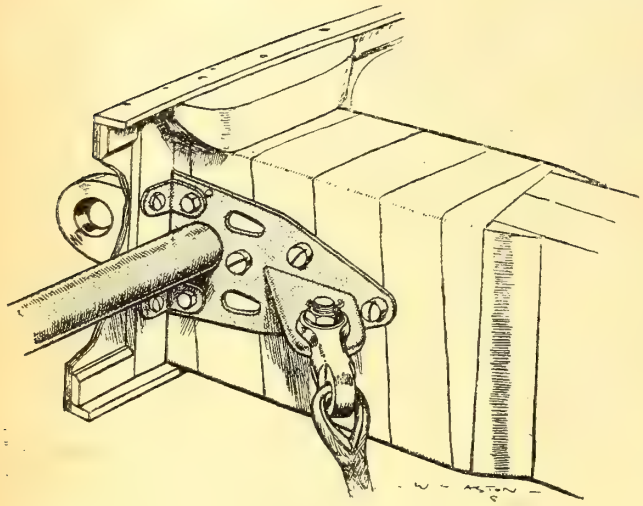

Fig. 9.

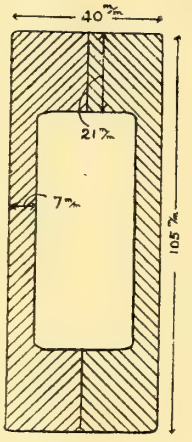

Fig. 11.

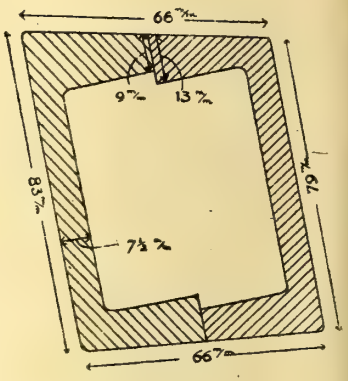

Fig. 12.

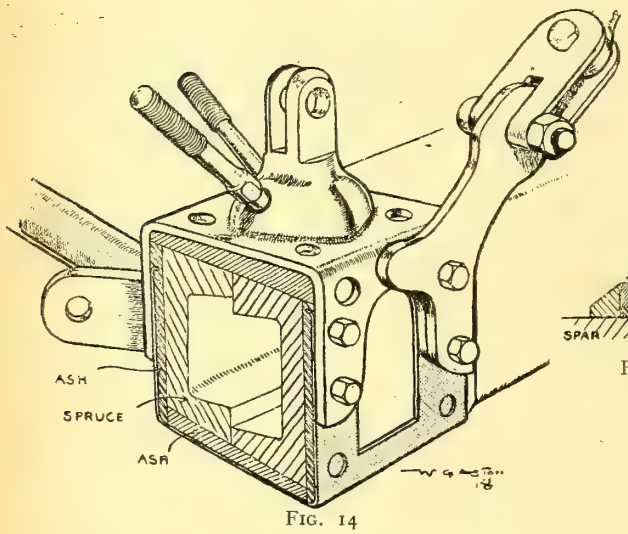

Fig. 14

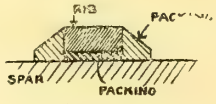

Fig. 13.

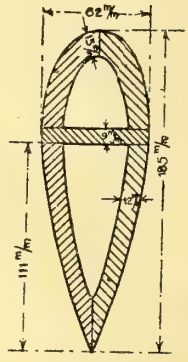

Fig. 15.

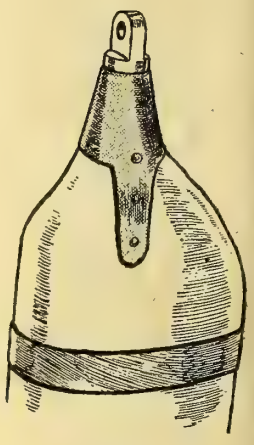

Fig. 16.

The interplane struts are attached to the main spars by joints of the type shown in Fig. 14. This, it will be seen, follows the typical German practice of partially universal jointed mountings for the cable attachments. At the points of attachment of these strut joints, suitably tapered packing pieces of hard wood surround the spars, which at these points are also wrapped with fabric.

Struts.

Outside of the centre section the interplane struts are of wood built up, as shown in the section Fig. 15, of five separate pieces. The curved portions are of timber which has not yet been identified, but is apparently of poor quality. The cross web is of ash. The strut is wrapped at frequent intervals with strips of fabric and is fitted with a socket joint of the type shown in Fig. 16. The outer pair of struts are of smaller section than the main struts, but are built up in a similar manner. Their section is 125 mms. × 40 mms.

Ailerons.

The framework is principally of welded steel tube wrapped with fabric.

A notable point is the thick section of the leading edge of the balanced portion, as shown in Fig. 17.

Fin and Fixed Tail-Planes.

The framework of these is steel tube and in the case of the tail-planes wooden stringers running fore and aft are arranged at intervals. The tail-planes are supported by diagonal steel tubes of streamline section, on the under side of which sharp steel points are welded to prevent these stays being used for lifting purposes.

Elevators and Rudders.

The framework in each case is of steel tube, the main tube being 35 mms. in diameter and the remainder 15 mms.

Bracing.

Throughout the wings, both internally and externally, the bracing is by means of multistrand steel cable.

Fuselage. (Rear Portion.)

At the after-gunner's cockpit the section of the fuselage has a rounded top, which is gradually smoothed down into flat. The section, for the greater part of the length, is rectangular, and the frame is built up in the usual manner with square section longerons and verticals, the joints being arranged as shown in Fig. 18. The cross bracing wires along the sides, top, bottom, and diagonal are of steel piano wire and are covered with strips of fabric, as shown in this sketch, where they lie adjacent to the fabric fuselage covering.

The vertical and horizontal compression members are located by spigots. The joint consists of a plate which completely surrounds the longerons, its two ends being riveted together to form a diagonal bracing strip. For the last few feet at the tail the fuselage is covered with thin three-ply.

The fuselage is covered with fabric, which is held in position by a lacing underneath and is consequently bodily removable.

The floor of the after-gunner's cockpit is elevated above the bottom of the fuselage. Immediately underneath this cockpit is a large trap-door, shown by dotted lines in the plan view of the aeroplane. This is hinged at its rearward end and furnished with two large celluloid windows. It is held in its "up" position by a long spring and a snap clip. No means could be found by which it could be fixed in its closed position. As footsteps are provided for all the cockpits, this trap-door is evidently not intended for ingress and egress. It could be employed in connection with a machine-gun firing backwards, as in the Gotha, but no machine-gun mounting was fixed in this machine for this purpose.

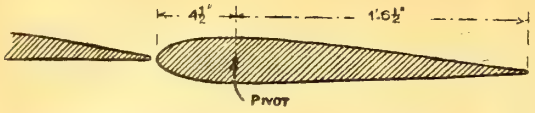
Contractors to H.M. Government.



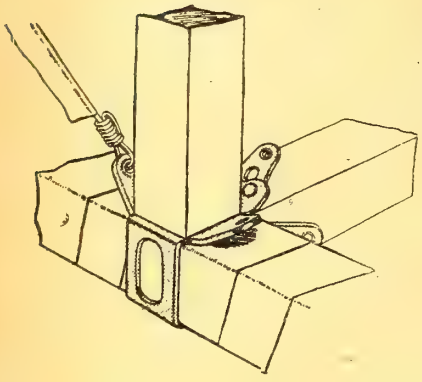


Fig. 17.

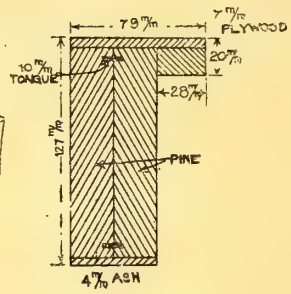

Fig. 20.

Fig. 18.

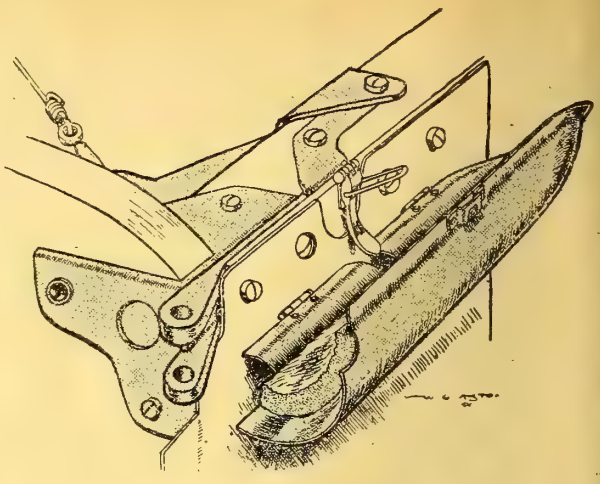

Fig. 19.

The rear portion of the fuselage is attached to the centre section of the body by a clip at each corner. This is shown in Fig. 19. The rear portion carries a male lug, which engages with the two eyes, and is held in position by a $\frac{3}{8}$ths bolt. Four other bolts in tension pass through the sheet metal clip, as shown in the sketch. In each case the lugs are furnished with sheet steel extensions which, as shown in the sketch Fig. 19, are sunk flush into the top and bottom surfaces of the fuselage longerons and are there held with three bolts. The corner joint is welded sheet steel, and there is an additional diagonal sheet steel joint which serves the secondary purpose of providing an anchorage for the bracing wires.

As this fuselage joint is level with the plane of rotation of the propellers, it is armoured both on the nacelle and on the rear portion of the fuselage with a hinged covering of stout sheet steel lined with felt. A plate of armour a foot wide also extends down each side of the nacelle at this point.

Forward Cockpit.

This is attached to the main body by four bolts with clips similar to those just described. It consists of a light wooden framework, covered throughout by three-ply.

The cock-pit can be divided off from the main cockpit by means of a fabric curtain. Its occupant is provided with the folding seat, and manages a gun and the bomb-dropping gear.

Engine Mounting.

The engine bearers have the section shown in Fig. 20, and are each built up of two pieces of pine united by tongues. On their top surface they are faced with ply wood, and at the bottom with ash. A strip of ash applied to the upper outer corner of the bearer gives it an "L" section, and has screwed into it the threaded sockets for the set screws of the lower part of the engine fairing. The engine bearers taper sharply at each end. They are mounted on the "V" struts by means of acetylene welded brackets, constructed as shown in sketch, Fig. 21. These, it will be seen, are of box form, and form a liner round the streamline tube.

The engine cowling is a particularly fine piece of work, and

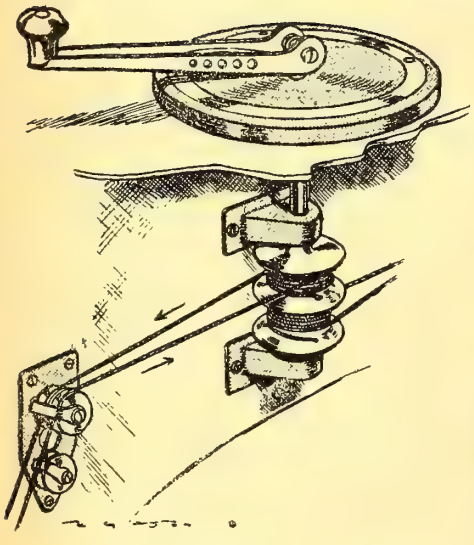

Fig. 26.

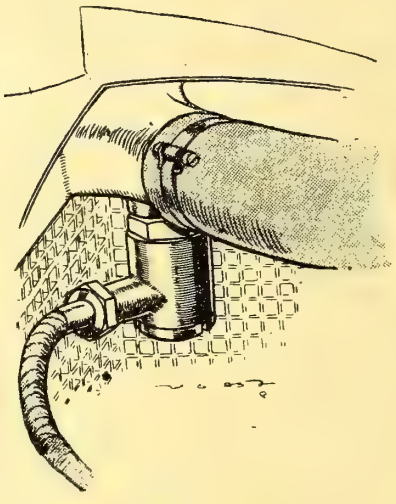

Fig. 27.

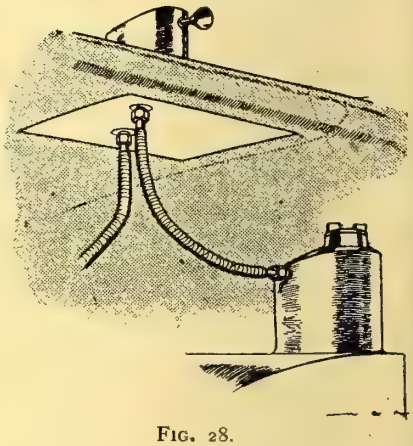

Fig. 28.

two views are given in sketches 22 and 23. The lower portion is attached to the engine bearers by set screws, but the upper part is readily detachable, being furnished with turn buttons. This cowling allows the cylinders of the engine to be exposed to the air. A large scoop is placed in front, so as to permit a free flow of air over the bottom and sides of the crankchamber, whilst at the rear three large trumpet-shaped cowls are provided so that a draught of air is forced against the crankcase in the neighbourhood of the carburetter air intake. In the rear the fairing abuts against the propeller nave, whilst in front it is attached to the radiator. It will be noticed that at each side of the radiator are narrow air scoops, the object of which is to promote a draught past the oil tank and front cylinder heads.

Engines.

The motors are the standard 260-h.p. Mercedes with six cylinders in line. Full details of this engine have been published, and it is only, therefore, necessary to notice one or two points in connection with the installation.

A new departure is the interconnection of the throttle and ignition advance controls. This is carried out in the manner illustrated diagrammatically in Fig. 24. It will be seen that a considerable movement of the throttle can be made independently of the ignition advance. In the Mercedes carburetter the throttle is so arranged that it cannot be fully opened near the ground without providing too weak a mixture, and it is thought possible that the full ignition advance is not obtained until this critical opening is reached.

On several German bombing aeroplanes grease pumps for lubricating the water pump spindle have been found. Fig. 25 shows the design as fitted to the Friedrichshafen. It consists of a ratchet and pawl operated grease pump, secured by a bracket to one of the engine struts, and worked from the pilot's cockpit by a lever, and a stranded steel cable passing over a pulley, the pawl being returned by a long-coiled spring.

The engine numbers are respectively MN.32299 and MN.36228.

The exhaust pipe is of new design, although it incorporates the well-known expansion joints attached to the flanges. It is fitted with what amounts to a rudimentary silencer, whereas in previous machines of a similar type to the Friedrichshafen an open-ended exhaust pipe was used.

Radiators.

Each radiator is provided with an electric thermometer fitted into the water inlet pipe, as shown in sketch, Fig. 27, these thermometers being wired up to a dial on the dashboard, which is furnished with a switch, so that the temperature of either radiator can be taken independently.

The radiators consist of square tubes to the number of 4,134, and measuring roughly 6 mms. each way.

The radiator block is V shaped in plan, and each is provided with a shutter which covers up a little more than a third of the cooling surface. This shutter is fitted with a stop, so that when fully opened it lies in the line of flight of the aeroplane. It is opened or closed according to circumstances by the gear, shown in the sketch, Fig. 26 of which the handle is mounted on the roof of the nacelle, immediately behind the pilot's seat. Three positions are provided for the handle, which operates the two shutters simultaneously by means of return cables.

Immediately above the main radiator, and let into the upper main plane between the front spar and the leading edge, is a small auxiliary tank, illustrated in Fig. 28. This is furnished with a trumpet-shaped vent in the direction of the line of flight, and is furnished with two outlets, one to the head of the main radiator, and the other to the water pump. The function of this tank is evidently to prevent the pump from priming.

Oil Pump.

The main supply of oil is carried in sumps forming part of the base chamber. A secondary supply of oil, from which a small fresh charge is drawn at every stroke of the oil pump, is contained in a cylindrical tank supported by brackets from the engine struts, and placed immediately behind the radiator. This tank has a capacity of 25 litres = 5½ gallons. Each tank is furnished with a glass level, which is visible from the pilot's seat.

Petrol Tanks.

The two main tanks which are placed, one under the pilot's

The "Guardian Angel" Parachutes

THE GUARDIAN ANGEL PARACHUTES
TRADE MARK
(REGISTERED)

THE CLASS OF OUR LIFE-SAVING EQUIPMENT.

The basic characteristics of our Parachutes, which differentiate them from all others, and for which we hold master-patents, are automatic (i.e., compellative) opening, and static and kinetic control (i.e., control at rest and in action) of all their component details. The ordinary parachute is under no sort of control, and what we have accomplished is to convert this most insubordinate Apache of the Air into a staid servitor, incapable of acting in any other than the designed way. We have made the Parachute into an automatic machine, so that failure to open and entanglement of rigging has become a physical impossibility. Every Type of Parachute made by us possesses these paramount and indispensable principles of machine action. The aviator makes his jump, and the Parachute automatically does the rest.

THE RANGE OF OUR LIFE-SAVING EQUIPMENT.

Life-saving Parachutes for school machines on the Training Grounds.

Life-saving Parachutes for heavy bombing machines, fighters, and scouts.

Life-saving Parachutes with minimum weight and without additional air resistance for the fastest machine that flies, and capable of release from any vertical or horizontal angle, or when flying upside down.

Basket-Parachutes for instantly detaching the basket Balloons, with a high but constant-speed initial drop from a fired gas-bag, automatically opening into the low-speed descent required for a safe landing.

Basket Parachutes for instantly detaching the basket containing two observers, their instruments and records, from a fired gas-bag, with high-speed initial fall, changing automatically to slow-speed descent for the safe landing. Parachute instantly released on landing, to avoid dragging the basket.

Variable-speed Parachutes, to permit a sudden high-speed drop, controlled by the Parachutist, to escape from an enemy aeroplane, and to stop on any portion of the grade of descent to avoid an objectionable landing. This variable-speed apparatus is applicable to the whole range of our Parachutes.

Non-spinning shock-absorber slings, taking all shocks off Parachute and man.

Aviator's Harness, distributing the stresses over those parts of the body best able to sustain them, and instantly releasable when alighting on land, on a roof, in a tree, or in water.

OUR EQUIPMENT IS THE RESULT OF ENGINEERING SCIENCE APPLIED TO DIFFICULT AIR PROBLEMS. WE BELIEVE THAT ITS EXTENDED USE WILL DOUBLE THE FLYING LIFE OF OUR FIGHTERS AT THE FRONT.

RELIABILITY—First. RELIABILITY—Second. RELIABILITY—ALL THE TIME.

Here is the sliding-pinion shaft from the De Dion lorry mentioned by E.N.D. in "The Highway." Note point of breakage.

Barimar welds the shaft.

Barimar machines, cleans up, and makes it ready for fitting. Another example of Barimar service.

A Broken leg may not interest you until you break your own

E. N. D., in "The Highway" for March, 1918, says: "In ordinary circumstances the Barimar 'before' and 'after' pictures would never keep me awake." But one morning, a friend of E. N. D., opened the gear-box of his De Dion lorry and found that the sliding-pinion shaft was "done in." An application to the makers failed to produce a new part—nothing in stock. E. N. D. then suggested to his friend that the broken part should be "rushed" to Barimar.

At 11 o'clock on Saturday morning, the broken shaft was delivered to Barimar, and at 2.45 on the following Tuesday the owner was notified that repair was ready.

E. N. D. adds: "I have not asked De Dion the price of a new gear-shaft, but I guess it would be at least four or five times as much as that of repairing the broken one."

That is the Barimar way. During the time some people waste in writing, telegraphing and telephoning about replacements, Barimar can make the repair, and save the owner money, time and worry.

Let these points soak in. It will pay you one day.

THE WONDERS OF WELDING

are treated in a crisp snapshot style in Barimar Manual "B.C.," entitled "The Welding Test." A copy is yours free by post if you have a broken part you want repaired. If you are only interested in the book, please send 3 penny stamps for postage.

Ask for Manual "B.C.," and mention The Aeroplane.

To get it to Barimar and "cut out the cackle"

Remove all fittings. Attach label with your name and address. Pay carriage. Advise by post with full instructions.

Address Repairs to Dept. "B.C."—

BELLING ELECTRIC GLUE POTS

for Aeroplane and other work

List No. 38.
Price 32/-
(Spare Elements 3/6 each)

Strongly made in cast iron, the Glue container being tinned.
Capacity: 2 pints of glue.
Loading: 900 watts.
3 elements, 3 heats, 3 loose connectors for attaching the cable to.
Weight: 14 lbs.
For use off a power circuit.

List No. 39.
Price 35/-
(Spare Elements 3/6 each)

As above, but with a loading of only 600 watts so that it can be used off an ordinary lamp socket.
Complete with connectors, 2 yards flex, and lamp holder adaptor.

List No. 40.
Price 47/6
(Spare Elements 3/6 each)

Similar to List No. 38, but fitted with a 3 heat switch on a separate panel, which is connected to the Glue Pot by 4 feet of metallic flexible tubing.
For use off a power circuit and recommended for Factory work.

All prices are subject to 25% advance.
Carriage extra on orders under £3 net value.

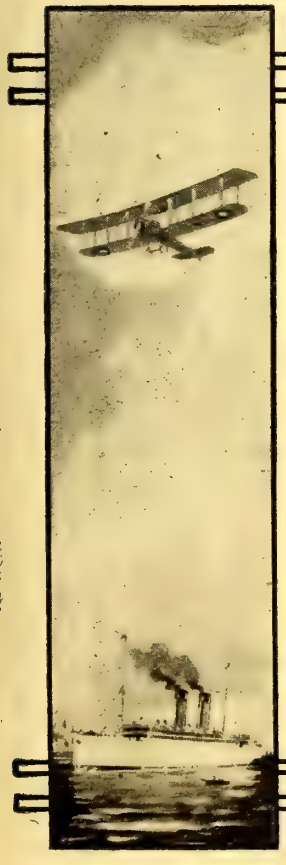
Davis High-Speed Steel Furnaces

The Davis "D.H.S.T." series of Gas-fired Furnaces have been specially designed for the hardening of modern High-Speed Steel Tools, and to provide the maximum of convenience and efficiency at the least practicable fuel cost.

The firing element consists of Davis PATENT Air-Blast Burners, for gas at ordinary main pressure and air at 2 lbs. per sq. inch. Two chambers are provided, each fitted with stopper brick, a pre-heating temperature of 1,000 deg. C. being attainable in the upper chamber, and 1,350 deg. C. in the lower; whilst the flame does not impinge on the work.

Illustration shows the No. 50 size (top chamber 10 in. by 4 in. by 2 in.; lower chamber with silica tube, 9 in. by 2¼ in. inside diameter). Price **£16 6s. 6d.** complete. Write for Lists F18 A, B and C (gratis).



Also Ovens, Muffles, Crucibles, Lead Melters, etc.

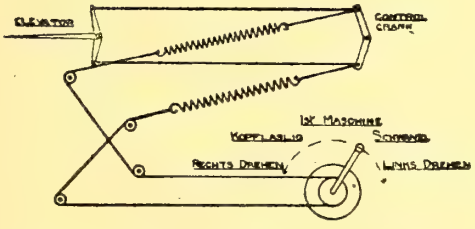

Fig. 34.

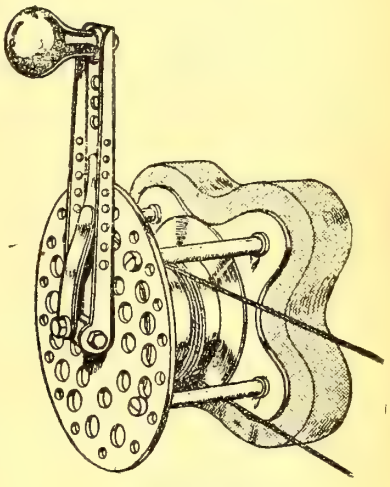

Fig. 35.

(*Continued from page* 1710.)

seat and the other at the top rear end of the nacelle, contain 270 litres = 59½ gallons each, and are made of brass. Each is provided with a Maximall level indicator, which employs the principle of a float operating a dial by means of a cable enclosed in a system of pipes.

A hand pump is fitted convenient to the pilot, and pressure is normally provided by the pumps installed in each engine. An auxiliary tank, holding approximately 13 gallons, is concealed in the upper main plane, not immediately over the nacelle but a little to the left side. This auxiliary tank is fitted with a level, as shown in Fig. 29, which is visible from the cockpit. The auxiliary tank appears to be used only for starting purposes. It is covered with a sheet of fabric held in position by "patent fasteners."

Engine Controls.

Running from each engine to the nacelle is a horizontal streamline casing, containing the various engine controls. A section showing the arrangement of these inside the fairing is given in the sketch, Fig. 30. The leading edge of the streamline casing consists of a steel tube, to which are welded narrow steel strip brackets, to the rear end of which are bolted thinner strips which are hinged in front to the tube. The whole is then enclosed in a sheet aluminium fairing.

Through the leading tube passes the throttle control rod for each engine, the two throttles being worked either together or independently by the ratchet levers, shown in Fig. 31. These are mounted on a shelf convenient to the pilot's left hand. This control requires a considerable number of bell cranks and countershafts, but was noticeably free from backlash. The throttle is opened by the pilot pulling the levers towards him.

On the dashboard are two revolution counters and two air pressure indicators. The metal parts of these dials are painted red for the left engine and green for the right, and the same colouring applies to the magneto switches, one of which contains a master switch which applies to both magnetos on both engines.

Piping.

The various systems of piping are distinguished by being painted different colours, thus the petrol pipes are white, arrows being also painted on them to show the direction of flow; air pressure pipes are blue, and pipes for cable controls grey.

Propeller.

The propellers are made by the Luckenwaide Propellerwerke, Niendorf. Each propeller is 3.08 metres in diameter and is made of nine laminations, which are alternatively walnut and ash, except one which appears to be of maple. The propeller has the last 20 ins. of its blade edged with brass. The pitch is approximately 1.8 metres and the maximum width of the blade 220 millimetres.

Controls.

Only one set of control gears is fitted, but as pointed out, the seating accommodation is so arranged that any of the crew can take charge if, and when, necessary.

The elevator and aileron control is shown in sketch Fig. 32. It consists of a tubular steel pillar mounted on a cranked cross bar at its foot. The ailerons are worked by cables passing over a drum on the wheel, whence they descend through fibre guides on the cross bar to another wheel mounted on a countershaft below, from which they are taken along inside the leading edge of the lower wing and finally over pulleys up to the aileron levers on the top plane. The latter are partially concealed in slots let into the trailing edge of the wing. The upper and lower ailerons are connected by means of pin jointed tubular steel struts of streamline section.

It will be observed from Fig. 32 that a locking device whereby the elevator control can be fixed in any desired position is fitted, and consists of a slotted link which can be clamped by a butterfly nut to the control lever. This link is hinged to a small bracket attached to the panel below the pilot's seat.

Fig. 33 shows the rudder control, from which cables are taken over pulleys and through housings in the nacelle and finally to the end of the fuselage. The cranked rudder bar is of light steel tube and is arranged to be placed in the pivot box in either of two positions. It is furnished with light steel tubular hoops which act as heel rests and are adjustable. A locking clip is fitted on the floor of the cockpit so that the rudder can be fixed in its neutral position.

A novel type of trimming gear is an interesting item of the

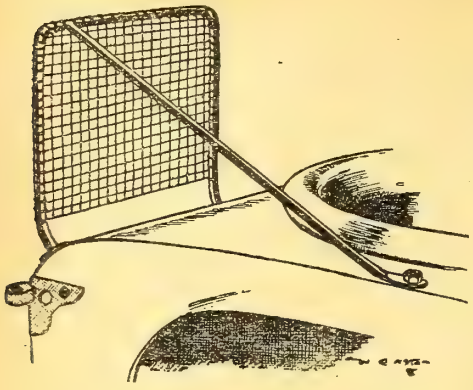

Fig. 36.

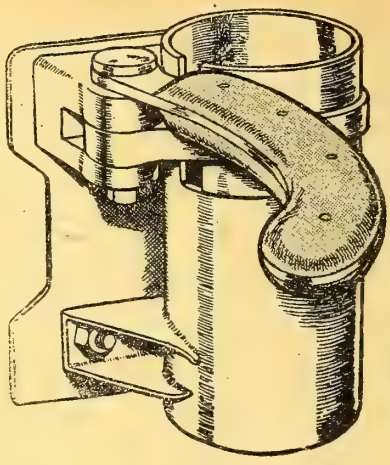

Fig. 37.

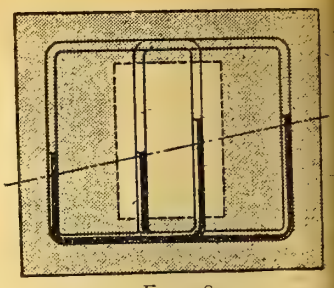

Fig. 38.

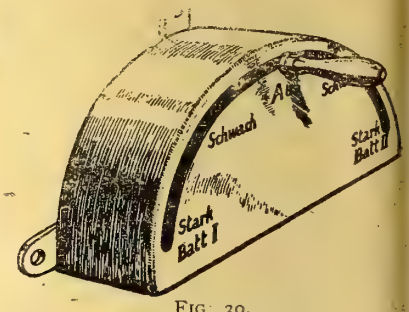

Fig. 39.

control. Movement of the elevator control from the normal upright position of the stick is made against the tension of one of two springs which can be alternately extended and relaxed by means of a winch connected to them, as shown in the diagram, Fig. 34. Normally these springs tend to bring the control stick back to a central position, in which the elevator lies flat, but if one of the springs is tensioned by winding up the winch in clockwise direction, the position to which the stick will tend to come when released will be such as to set the elevator at a positive angle. This winch gear, which is illustrated in Fig. 35, is mounted on the right-hand side of the nacelle, and is therefore under the command of the pilot's companion.

The crank is furnished with a locking pawl, which engages with a ring of small holes bored in the plate of the winch. The steel springs used in conjunction with this apparatus are some 3 ft. long and about ¾ in. in diameter. The inscription behind the winch reads :—

Nose heavy—Right wind.
Tail heavy—Left wind.

Landing Gear.

As might be expected, the landing gear on this machine is of massive proportions. Two vertical streamline section wood-filled tubes descend from the centre section wing spars, immediately under the engine, to a bridge piece or hollow girder made of welded steel. Through an oval hole in this girder a short axle carries two 965 mms. × 150 mms. wheels (38 in. × 6 in.) These work up and down against the tension of a bundle of steel springs about ½in. in diameter and made of wire approximately 1-16in. thick.

The steel girder is extensively pierced for lightness, and the edges of the holes are swaged inwards. The axle is prevented from moving sideways by plates, and is provided with short steel cables which act as radius rods and connect it to the front of the girder. The whole of the box girder is covered in with a detachable bag of fabric, which extends up to the small cross bar mounted immediately above the girder.

Mudguards are provided behind each landing wheel for the purpose of preventing any mud or stones dislodged by the wheels from coming in contact with the propellers.

From the front and rear of the box girder streamline tubes are taken to the ends of the main wing spars, where they abut against the nacelle, and these diagonals are further braced with streamline steel tubes. Both the vertical and diagonal tubes are held in split sockets so as to be easily replaceable if damaged.

In addition to the four main landing wheels, a fifth is mounted under the nose of the fuselage. This wheel is 760 mms. × 100 mms. (30in. × 4in.) It is mounted on a short axle, which is capable of sliding up and down slots in its forks against a strong coil spring, and it is also capable of a certain amount of lateral movement along its axle, also against the action of two small coil springs.

The tail portion of the fuselage is protected by a fixed skid made of wood but shod with a steel sole. This is fitted with a small coil spring contained inside the fuselage.

Wiring.

The whole of the wiring system on the machine is very neatly carried out. There are three main systems; firstly, the ignition wiring, which is contained for the most part in tubes of glazed and woven fabric; secondly, the heating system, for which the wires are carried in flexible metal conduits; and, thirdly, the lighting system, in which a thin celluloid protective tubing is used. Wires are run from the nacelle along the leading edge of the upper planes to points level with the outermost strut. Here they terminate in a plug fitting placed behind a hinged panel. Apparently lamps are intended to be served by this circuit. Immediately in front of the pilot's seat a universally jointed lamp bracket is mounted on the outside of the nacelle. The exact purpose of this lamp is not known, as it could not illuminate any instruments.

Armament.

Both the forward and rear cockpits are furnished with swivel gun mounts carrying Parabellum machine guns. These mounts consist of built-up laminated wood turntables working on small rollers, and carry a U-shaped tubular arm for elevation. This arm is hinged to a plunger rod working through a cross head and arranged so that the arm is normally pulled down flat on the turntable by a coil spring. The plunger can be locked in any of a series of positions by means of a bolt operated by a hand-lever through a Bowden wire. A second lever allows the turntable to be locked at any desired point. A perforated sheet-metal shield protects the cross head and spring. Small shoulder pads are fixed on the turntables, of which that in the forward cockpit has a diameter of 2ft. 10½in., whilst in the rear the diameter is 3ft. ½in.

The after-gunner is prevented from damaging the propeller by two wire netting screens, supported by tubular steel brackets placed on either side of his cockpit. These are sketched in Fig. 36.

In addition to these two guns, provision is made for mounting a third in front of, and to the right of, the pilot's cockpit, where it could be managed by his companion. For this purpose a clip is provided immediately under the coaming of the nacelle, and the handle of this protrudes through a slot in the dashboard. The clip works on the eccentric principle, and appears to be self-locking. Its construction is shown in detail in Fig. 37.

A rack for Verey lights is mounted on the outside of the nacelle convenient to the pilot's companion.

INSTRUMENTS.

Airspeed Indicator.

Considerable interest attaches to the fact that this Friedrichshafen Bomber is the first enemy machine brought down which has been found provided with an airspeed indicator. This is of the static type, embodying a Pitot head of the usual type. The indicator has a dial of large size, and is altogether a much more bulky instrument than any for a similar purpose used in British machines. An investigation of its mechanism is being made.

Altimeter.

This is of the usual type, reading to 8 kilometres.

Level Indicator.

This is a somewhat crudely made device, employing two liquid levels, as indicated in the diagrammatic sketch Fig. 38. It will be seen that the reading gives the pilot an exaggerated idea of the angle of roll. The glass tubes are sealed up, and contain a dark blue liquid. One side of the dial is engraved Hängt links (Hangs left), the other Hängt rechts (Hangs right). The manufacturer is Arno Weisse, Berlin.

Revolution Counters.

The dials give readings from 300 to 1,600 r.p.m. The section between 1,300 and 1,500 is painted black, and these figures are marked with luminous compound, as also is the indicating hand. The manufacturer is Wilhelm Morell, Leipzig.

Air Pressure Gauges.

These read from 0 to 0.5 kilogrammes per square centimetre.

Firth's
Best Cast Steel
Files.

Thos. Firth & Sons, Lᵗᵈ, Sheffield.

VICKERS LIMITED.

CONTRACTORS TO H.M. GOVERNMENT.

Aviation Department, Imperial Court,
Basil Street, Knightsbridge, S.W.3.

Telephone No.—
KENSINGTON 6520 (4 lines).

Telegraphic Address—
VICKERFYTA, KNIGHTS, LONDON.

There is a red mark against the figure 0.25 kg. The manufacturer is Maximall Apparat Fabrik, Berlin.

Electric Thermometer Dial.

This dashboard instrument consists of a box-type meter, the dial reading from 0 to 100 deg. C. The figures 0 and 75 are accentuated by red marks. A switch at the side of the box, having positions marked 1 and 2, allows the temperature of either radiator to be read.

Petrol Level Indicators.

These are of the Maximall type, and employs a float immersed in a tubular guide in the tank. This float communicates its motion to a finger working over a circular dial, by means of a thin cord passing over pulleys. These are encased in pipes, which are under the same pressure as the tank.

Electric Heating Rheostat.

This is illustrated in Fig. 39. It is marked Aus (off), Schwach (weak), Stark (strong). There are two separate resistance coils, enabling the rheostat also to perform the function of a change-over switch.

Wireless.

The machine is internally wired for wireless, and the left-hand engine is provided with a pulley and clutch for driving the dynamo. Reference to Fig. 22 will show that this is designed to be mounted on a bracket carried by the outside front engine bearer strut, and that the engine fairing is moulded to receive it.

Bombs and Bomb Gear.

At each side of the covered-in passage way in the nacelle are bomb racks capable of holding five 25-pounder (12 kg.) bombs.

Underneath the nacelle are carried two large tubular frames, fitted with cradles of steel cable, and furnished with the usual form of trip gear.

These racks would, it is believed, be capable of supporting a 300 kg. bomb a-piece. The bombs carried, however, evidently vary with the radius of action over which the aeroplane has to operate. The large racks are not permanently attached to the nacelle, but can easily be removed as required.

Inside the front cockpit from which the release of the bombs is conducted, there are seven triggers for the small bomb racks and two levers for the large bomb trips. The cables for this gear are carried under the floor, and are painted different colours for distinction.

Bomb Sight.

The bomb sight carried on the machine presents no new features, and is of the ordinary German non-precision type.

Fabric and Dope.

Two entirely different kinds of fabric are employed in the Friedrichshafen machine. The wings are covered with a low grade linen of the class which is employed on most of the enemy machines. It is white in colour. Compared with that of British fabrics, the tensile strength is fairly good.

This fabric is covered with a cellulose acetate dope, and is camouflaged in large irregular lozenges of dull colours, including blue-black, dark green, and earth colour.

The other fabric, which is applied to the fuselage, tail plane, rudder, elevator, fin, and landing gear, is apparently a cheap material, much inferior to British fabrics designed for a similar purpose. This fuselage fabric is dyed in a regular pattern of lozenges, the colours being hardly distinguishable from black. The dope is acetate of cellulose.

In both cases the dope seems to be carelessly applied.

Changes in Design.

When compared with the Fdh. GIII., No. 177/17 (of 13/9/17, brought down by the French, this Friedrichshafen presents a few differences in detail design, amongst which the following points may be noted:—

(1) Engine fairing. In No. 177 spinners were mounted on the propeller bosses, and an aluminium ring of large diameter mounted on the rear extremities of the engine bearers in order to carry the rearmost fairing panels.

(2) Exhaust pipe. In the No. 177 this was, as in the present case, trumpet shaped and turned back at the end, but instead of a series of slots being used, the open vent was "bottled," i.e. that the orifice was slightly restricted, and an additional circle of small holes provided.

(3) Engine bearers. These were of ash in the No. 575, and the L-shaped extension was not used. The method of building up the bearers was, however, similar to that described.

(4) The weight empty was 2,665 kg. in the No. 177, as against 2,695 in the machine under review.

(5) The air scoops under the engine fairing were smaller.

(6) The arrangement of the instruments, taps, etc., on the dashboard was quite different.

A CRITICISM AND A REPLY.

Sir,—I would head these few notes, "A Plea for the Standardisation of Data," and I think this is a subject which might well receive far more attention than at present, especially with the valuable aid of the technical press. The series of articles by Mr. C. Sylvester, which has commenced in your journal, prompt me to make the following suggestions and criticisms of the methods of authors and others when treating on scientific subjects.

To begin with, data in the centimetre-gramme-second system of weights and measures are often mixed indiscriminately with others in the inch-pound-second system, like dimensions on a sub-contractor's blue-print.

Thus, after giving the specific heats of various metals with evident relation to the English system, and Fahrenheit's scale of temperatures, their melting points are given in degrees Centigrade. And, let it be remembered, that the figure representing specific heat does not denote by which system it was arrived at, being generally a plain decimal. And re Magnalium, why say that its specific heat is "about .2184 degrees Fahr.?" Incidentally, its melting point is given in Fahr., while all the others are in Centigrade.

Again, the language used in these otherwise instructive articles is extremely loose; for example, Mr. Sylvester says: "Heat is sometimes termed temperature . . . that the temperature is more hot or cold, as the case may be."

Now heat is a form of energy, says theory, and the temperature of a body is the amount of heat the body possesses; obviously, then, it cannot become hot or cold.

A little further on he expounds the theory or principle of the efficiency of the transference of heat, giving an example where 60 per cent. of an amount of heat is transferred, but the student is left guessing if he should become acquainted with the Law of Mixtures, which states that "the amount of heat lost by the hotter equals the amount gained by the colder," when speaking of the transference of heat from one body to another.

It is evidently quite a slip when the writer refers to 63 deg. C. as the boiling-point of water, but I think that the graph, Fig. II, might well bear a zero mark, to give some indication of why the curve is shaped as it is.

Such details as these are of little importance when one knows the rudiments of the subject beforehand, but seeing that the articles are intended obviously for the elucidation of the uninitiated, one thinks they are apt to prove confusing.

(Signed) N. Biles.

The Reply.

Sir,—I have read the letter from Mr. Biles, and I think it calls for a little comment from me. Authors are at all times open to criticism, and, as a rule, they welcome criticism of a healthy description; that is, if their critic knows what he is doing.

Mr. Biles appears to take exception to my method of explaining temperature. This is strange, because it is really the most natural thing in the world to say, if one meets a friend in the street, "It is warmer or colder to-day," as the case may be. Perhaps Mr. Biles would have me say, "The temperature is higher, or lower," or it may be that he has a vocabulary of his own concerning temperature.

His criticism of the degrees of temperature are very vague. It appears that he is disappointed that I did not quote the rule for converting Fahrenheit into Centigrade. If this is so, I will quote it for his benefit:—

"To convert Fahrenheit into Centigrade, subtract 32, multiply by 5, and divide by 9."

I really cannot grasp what he means when he states that the curve in my second article is not complete. To my mind, the curve and points are perfectly obvious. So much so that if a small boy of twelve could not be made to understand it in three minutes, there must be something wrong with his understanding faculties.

His statement that no heat units are lost in a transfer of heat is ridiculous to the extreme. Beyond saying that the efficient transfer of heat is the greatest problem of engineers, I leave it to his own sense of reasoning to show him his mistake.

If I can enlighten Mr. Biles on other small points, I shall be happy to do so.

(Signed) C. Sylvester.

LORD DENBIGH AT BLACKBURN'S.

On April 23rd Colonel the Earl of Denbigh, M.V.O., A.D.C., visited the works of the Blackburn Aeroplane and Motor Co., Ltd., and addressed the employees of the firm upon the importance of their work in connection with the war. The speaker lectured on Germany's projects in relation to the Far East and the desire of the enemy to establish a direct route through Serbia to Baghdad.

He thought that people who wanted peace to-day were either lunatics or enemy agents, and in either case the only thing that was good for such people was hanging.

DANISH COMMERCIAL AVIATION.

A Danish aeronautic company has been formed with a share capital of £111,000, with the object of establishing an air route after the war between Copenhagen, Esbjerg, and London, the route to be connected with other Scandinavian air routes.

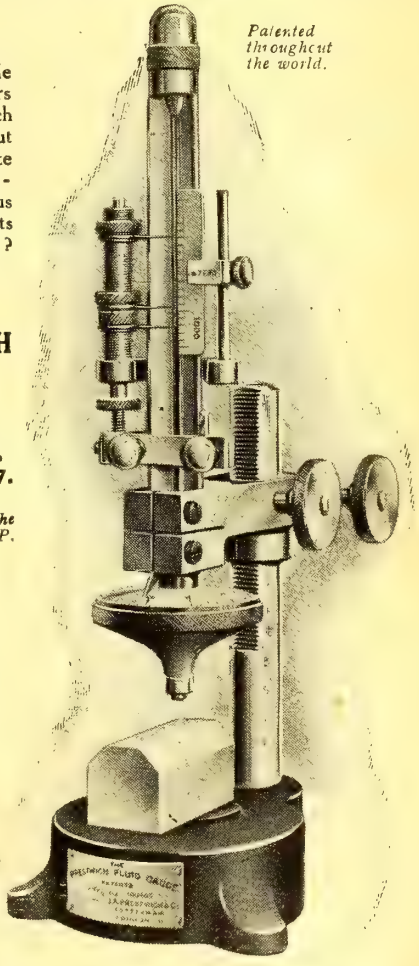
A Profitable Investment for all MANUFACTURERS OF ENGINE PARTS

or any other work which requires gauging to fine limits

The usefulness of the Prestwich Fluid Gauge is invaluable where repetition work to fine limits is carried out.

This instrument overcomes the difficulties of micrometer and special gauges, and is the quickest and most accurate method of gauging it is possible to use.

The Prestwich Gauge has no wearing parts, and will give unfailing accuracy for years. An error is magnified 1,000 times and is thus easily visible to the eye. Skilled labour is not essential, and readings may be taken to the $\frac{1}{50.000}$ part of 1" at the rate of 60 per minute if necessary.



The Prestwich Fluid Gauge

Accuracy to the ten-thousandth part of an inch with ease

The ideal instrument for quickly and accurately gauging all kinds of spindles, rollers, etc., and parts used in Aero Engine Construction.

It is worth your while to obtain full particulars regarding the Prestwich Fluid Gauge without delay! Why not write us to-day for our illustrated booklet and let us know your requirements whatever they may be?

Patented throughout the world.

Steel Tubes, Tube Manipulation, and Tubular Structures for Aircraft.

A most interesting paper was read before the Aeronautical Society on Thursday, May 2nd, by Messrs. W. W. Hackett and A. G. Hackett, of Accles & Pollock, Ltd., the famous tube manufacturers, of Oldbury, Birmingham.

So interesting was the paper, in fact, that it would be extremely inadvisable to publish the whole of it. Skilful as the Germans are in all classes of metal work, and excellent as is their best steel, such as that from which B.N.D. and Mannesmann is made, some British firms are ahead of them, and one knows Accles and Pollock to be one of those firms.

As the practical man who has perhaps had more to do with the making of A. and P. tubing than anyone else, Mr. W. W. Hackett could teach the most expert German tube makers quite a great deal, and his lecture on Thursday certainly taught his audience much which they hardly ever suspected concerning the manipulation of tubing and its possibilities. One therefore publishes only such parts of the paper as are of interest, but cannot give away information to the enemy.

Mr. W. W. Hackett, who delivered the first part of the lecture, said:—

Independent altogether of the stimulus given to the use of tubing for structural work by the advent and advance of aeronautics, the uses to which tubing of steel and other metals is put has increased considerably during the past few years. Much, of course, has been due to the large output of cycles and motor-cycles, but in addition an immense quantity of tubing is used in the construction of motor-cars, and in a thousand other productions which it is unnecessary to particularise in this paper. The section of tubular work in which we are more especially interested at the moment, however, is that which has relation to aircraft construction, and in this paper we hope to deal with some of the main features of this important subject, giving a brief review of the method of manufacture generally employed, of some of the difficulties that have had to be overcome, and of some of the forms of manipulations which it is possible to put upon good quality steel tubing. The latter part of the paper will deal with tests carried out on specimen tubes, under various conditions, and jointed together in different ways. All that we have to say will apply to seamless steel tubing.

In dealing with such a subject as this other articles must be brought under review, such, for instance, as lugs and liners, as these enter so largely into the construction of articles built mainly of steel tubing. Mention will be made of cycle and motor-cycle experience in the use and abuse of steel tubing.

Seamless Steel Tubing.

Seamless steel tubing is a product of modern times, some 35 years having passed since the first experiment was successfully carried through. Its commercial production has often made possible the manufacture of articles which could not otherwise have been made, and in other cases it has been the means of popularising articles which were having a very small sale, and which were even looked upon as freaks.

Many present will remember the old bicycles which were built of gas pipes and solid pieces of iron, and will have recollections of the energy taken to propel these machines, especially up an incline! The coming of seamless steel tubing soon altered that, and a few years later cycle frames were being built of light gauge tubing, enabling a man to propel himself at 10 to 20 miles an hour on a structure weighing about 30 lbs. Two things made the cycle a commercial success: pneumatic tyres, which made riding more comfortable, and light gauge steel tubing, which brought down the weight of the cycle to a minimum. A further word must be said for the pneumatic tyres, namely, that by minimising the shock to the frame they made possible the introduction of lighter gauge tubes than could otherwise have been safely used.

How Seamless Steel Tubing is Made.

To commence the manufacture of a seamless tube a solid billet of steel, well hammered and rolled, is taken. This billet must be carefully examined for various faults, and any lamination or surface defect removed by chipping, or else the outside of the billet must be turned all over. The usual practice when the latter is done is to turn about $\frac{3}{32}$ in. off the diameter of the billet.

The first operation is then to pierce a hole. Two ways of doing this are in general use; one is by means of a hydraulic press, similar to the method of piercing shells so common in this country to-day, and the other by means of a rotary piercing machine. The billet, first centred with large shallow holes, is heated to about 1,200 deg. C. and fed between rolls having a curved outline and set at an angle which imparts a forward movement to the billet as it is rotated. Great pressure is used (which causes the billet to tend to open along its axis), and the billet is forced against and over a pointed mandril held on the end of a stout rod, which butts against a bracket at a distance of about 7ft. from the centre of the rolls.

A billet, 4ins. diameter by 24ins. in length, will be made in one operation into a tube about 4ft. to 5ft. long. The pierced billet is then taken to another machine which is provided with upper and lower rolls having semi-circular grooves of various radii, and by a series of operations is rolled into a tube of the required size. The tube is passed over mandrils to give the required thickness.

A much quicker process of rolling mild steel tubes is by means of Pilgré rolls; but for high carbon steel or chrome nickel steel this process has been found to be unsuitable.

Cold Drawing.

The first operation in the cold-drawing mills is that of "tagging"; the hollow bloom (as the rough rolled tube is called) being reduced at one end by suitable semi-circular tools in a power-forging hammer. The tube in the drawing operations to follow will be pulled through the dies by means of the "tag" thus formed. A small hole is also put into the tube at the point where the tag commences, in order to allow acid and water to work through the tube in the subsequent pickling and swilling processes.

After being "tagged" the tube is annealed, pickled in a bath of acid to remove the scale, and then swilled in clean water. Following this, the tube is dried and then immersed in a solution of soap, or in oil, to lubricate it for the drawing operation. It is now ready for drawing.

There are two methods of cold drawing in general use. One is by drawing down the outside diameter of the tube upon a long bar of uniform diameter and then passing the tube, while on the bar, through rolls fixed in a "reeling" machine, which is similar to that used in the rotary piercing operation. In carrying out this method the tube is put on to the bar, which must of necessity be smaller than the bore of the tube to be drawn. The tube and the bar are then pulled through a die of hardened steel of such a bore as will give the proper reduction of gauge to the tube.

The tube is gripped on the "tag" by means of "dog" jaws sliding on inclined planes. The "dog" is moved along the draw-bench by hooks which are dropped into the links of an endless chain. The chains move at a speed of from 12ft. to 35ft. per minute, according to the class of material to be drawn. This process of cold drawing permits of a greater reduction of thickness at each draw than can be obtained by the more usual process of "plug" drawing, but is rather harsh on the material, and the expanding of the tubing (already hardened by drawing) to allow the mandril to be extracted sometimes causes splits and fractures. These are more likely to appear if this process is used after the tube has been drawn to a light gauge.

The second method is that known as "plug drawing," and is more usually adopted; in this case a short, hardened mandril is screwed into one end of a long bar. This bar is screwed at the other end into a larger piece of steel known as the "back sleeve," which is screwed and fitted with a nut at either end. This sleeve has an axial movement of about 9ins. in the back casting of the draw-bench. The nut at the back is used for the purpose of adjusting the position of the mandril in relation to the die.

The tube is threaded over the mandril and the "tag" is passed through the die, which rests against the die plate. Immediately the "tag" is gripped by the "dog" it commences to move, the mandril at the same time being drawn forward into position by means of a rope or chain. A reduction in gauge thickness and diameter, with an increase in length, is the result, due to the walls of the tube being drawn down between the mandril and the die.

The usual reduction by this method is about a gauge and a half per draw on low carbon steel. The operation of cold drawing hardens the tube to quite a large extent, and subsequent annealing is necessary.

Annealing.

A properly annealed tube showing an ultimate tensile stress of about 30 tons per square inch should give about 38 tons after undergoing the drawing operation. Properly to prepare the tube for further cold drawing it is therefore necessary to anneal after every drawing operation, which means it has also to be pickled, washed, dried, and lubricated. A hollow bloom $1\frac{7}{8}$ in. diameter by 8 in. gauge would require nine or ten "draws" to make it into a tube $1\frac{1}{4}$ in. by 22 in. gauge. The annealing is carried out in suitable muffles, usually at a temperature of about 600 deg. to 650 deg. C., until before the last "draw," when a temperature of about 850 deg. C. is advisable. In the case of light gauge tubes, this should be done by "close" annealing, as the scaling and blistering of a light tube by "open" annealing would be fatal.

When a tube has been drawn to about 7/16 in. diameter there is great difficulty experienced in drawing on a mandril. The usual practice is to finish $\frac{3}{8}$ in. diameter tubes and smaller by reducing the diameter only. This is termed "sinking." The

condition of the tube finished in this way is not so good as when finished on a mandril, the strength of the tube being less. From experiments made, tubes from .5 per cent. carbon steel finished by "sinking" show about the same tensile strength as tubes from .35 per cent. carbon steel finished with the usual "draw" on a mandril.

Chrome Nickel Tubes.

The advent of aeroplanes and airships has given rise to a demand for steel tubing of a higher class than before, tubes of high carbon and alloy steels being called for. This has meant careful investigation in order to find the best heat treatment to be accorded in each particular case. The first attempts at drawing chrome nickel steel were scarcely a success, and many breakages of mandrils and even draw-benches resulted from the unsatisfactory annealing of these tubes. Chrome nickel tubes are now being successfully drawn by the same methods as are used for mild steel tubing—by means of "plug drawing"—but very great care needs to be taken in the annealing.

The amount of reduction in gauge per draw is less than half that which is usual in the drawing of mild steel, but in spite of this the wear on mandrils and dies is very great.

A typical analysis of chrome nickel steel is as follows:—

Carbon	.3	per cent.
Silicon	.16	,,
Sulphur	.03	,,
Phosphorus	.03	,,
Manganese	.45	,,
Chromium	1.10	,,
Nickel	4.00	,,

Such a steel, when air-hardened, has an ultimate tensile stress of about 100 tons, but a low elastic limit to a maximum value of about 70 tons. Tempering will raise the yield point, and, at the same time, slightly reduce the ultimate stress. This steel is being much used for aeroplane axles.

One feature that should be mentioned here is the very serious effect of sulphuric or muriatic acid on hardened chrome nickel steel tubing. It has the effect of making the material exceedingly brittle. It is therefore inadvisable to use acid to remove scale from a hardened chrome nickel steel tube; but the injurious effect of the acid can be almost entirely removed by suitable heat treatment.

Acid affects other high tensile steels in the same way, but to a less degree, and has a considerable effect even on mild steel.

Section Tubing.

Section tubing has been extensively called for by aeroplane designers, and streamline tubing is used to quite a large extent. The first streamline tube our Company (Accles & Pollock, Limited) were asked to make was designed by Mr. Howard T. Wright in 1908, and is a section that is very near to the recognised standard of to-day. Section tubing, the streamline-shaped tube especially, is much easier to make if straight sides are avoided, as straight or concave sides compel the use of mandrils and add to the difficulty of production. There are three ways of making sections from seamless tubing, namely, by drawing, rolling and pressing. Pressing is only practicable on fairly short lengths. In drawing there is a slight reduction in periphery in passing from the round, but in rolling or pressing it remains the same.

Some Difficulties Overcome.

It will be useful in this paper to review some of the trouble we have met with in connection with other trades where tubing has been used to a great extent, and to mention some of the failures, as the same or similar faults may occur in aeroplane construction. When the Bowden brake was first used on cycles and motor-cycles the practice followed was to drill the tube near the handlebar lug to allow the cable to pass through, and this resulted in a large number of breakages. This difficulty was overcome by drilling the holes through the lugs; but many accidents occurred before this practice was adopted.

Under an alternating stress a tube which has been drilled, unless properly reinforced, is very likely to fail. A series of running tests on drilled and undrilled tubes has shown that when stressed up to near its elastic limit the undrilled tube has in many cases 10 to 20 times the life of the drilled tube. It is often the case that the harder the tube the greater the risk of breakage through a hole. One way of breaking a hard-drawn tube, adopted in tube mills, is either to "nick" the tube on one side with a file or to punch a hole in one side and then break by striking the tube on a block or anvil.

Quite recently we have carried out a large number of important tests on a special type of alternating stress testing machine which we had built. This machine, together with many of the tests carried out and the results achieved, was to a great extent due to the enthusiasm and foresight of Lieutenant-Commander H. N. Wylie, R.N.V.R., and Lieutenant R. W. Fieldwick, the Resident A.I.D. Inspector at our works, to whom we wish to express our thanks for help given.

Badly Designed Cycle Lugs.

Another series of failures was caused by unsuitable lugs. Some of those used in the earlier days of motor-cycling had very strong outlets, and case after case of tube failure occurred. The tubing sometimes broke off so cleanly as to give the appearance of having been cut through. The broken tubing could be flattened, thus proving it was ductile and in a proper condition for its purpose.

In order to prove that the fault lay in the excessive strength of the lugs, a series of experiments was carried out a number of years ago. A lug, as generally used, was tapered off at one outlet and left strong at the other. A piece of tubing of the usual gauge and quality was brazed into the lug and the lug firmly secured to a plate. The ends of the two tubes were then moved by eccentrics and connecting rods giving a ¼ in. movement at a speed of about 400 alternations per minute. Each time the experiment was tried the tube broke off cleanly close to the thick outlet, whereas the tube at the tapered outlet remained intact.

[Obviously the tapered lug-end gave a certain amount of spring, and so did not provide a dead rigid fulcrum against which the tube could break. Also, one imagines that a heavy, strong lug contracts onto the tube in cooling after brazing and affects the composition of the tube immediately at its junction with the lug. Furthermore, tubes are almost always weakened after brazing by careless filing—in removing spelter and flux and scale—just outside the lug, where they ought to be strongest. —C.G.G.]

In these tests two types of grips were used, one tapered and one not, and two points were proved, namely, the beneficial effects of "blueing" and the increase in the life of a tube when held by a grip having a tapered outlet. Another interesting feature of the test was the spiral form of the break.

Another interesting test was as follows:—After brazing the tube into a lug with respectively thick and tapered outlets similar weights were applied to the ends. The tube in the tapered outlet bent with an easy curve, but that at the other end bent abruptly close to the thick outlet.

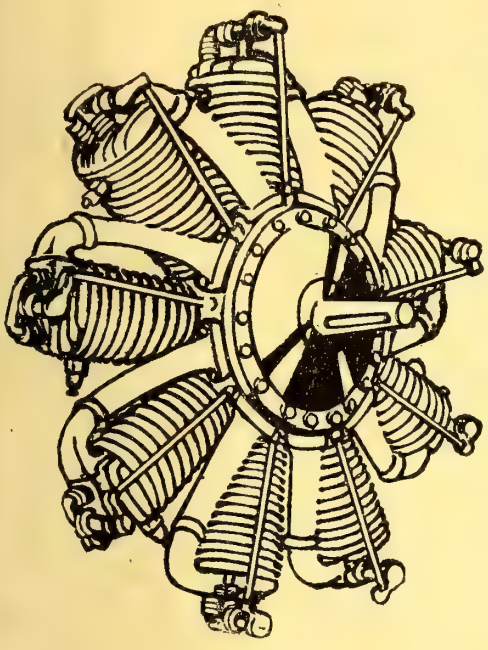
Front Forks for Cycles.

It has been proved to the satisfaction of many cycle and motor-cycle engineers that to keep on merely increasing the gauge of a tube that appears to be too weak for its work is not always good practice. For instance, take the case of the front fork tube as used on the ordinary cycle. This tube has proved of ample strength for use on the excellent highways of this country, but for Continental roads something better was wanted.

Some years ago we supplied a large quantity of front forks produced from 19-gauge tubes to Russian cycle manufacturers. We were asked to increase the thickness to 18-gauge, on account of a number of breakages occurring. We did so, but matters were not improved, and we were then requested to further increase to 17-gauge. There was still no improvement; indeed, the number of breakages increased. The forks all broke off where they were brazed into the crown, and we were asked by the Russian manufacturers to help them out of their trouble. One way of doing this would have been by using a suitable liner or sleeve, but we tried another method, which proved quite successful. We brought back the gauge of the tubes to 19 where brazed into the crowns and tapered the gauge to 22 at the bottom ends.

This proved effective; a lighter article by about 40 per cent., from the same quality steel, thus standing the strain successfully. This result is accounted for by the fact that the shock was more equally distributed along the tubing, due to the strength being reduced, gradually, away from the brazed portion, whereas in the plain gauge tubing the whole of the movement was concentrated in a very small space near the crowns.

[Where, as already mentioned, it was weakened by heating and cooling in brazing, and by filing afterwards. By lightening the gauge towards the tips, the makers simply produced the effect of a fishing-rod.—C.G.G.]



Tapered Tubes.

Tapered tubes could, in our opinion, be used in aeroplane construction to a much greater extent than at present, especially as struts or spars.

Alternating tests as follows were carried out at 400 revolutions per minute on 1 in. by 20-gauge steel tubing, using two parallel lengths and two pieces tapered ½ in. per foot. A weight of 111.56 lbs. was suspended on each tube at a distance of 12⅝ in. from the grips, giving 25 tons stress. The plain pieces broke after 20,585 and 30,390 revolutions respectively, as against 23,557 and 38,225 revolutions respectively by the tapered pieces. The weight of the plain tubes was 6¾ ozs. each, and that of the tapered tubes 6¼ ozs. each. In both cases the break on the plain tubes was straighter than on the tapered one.

[One would like to see some tests done at 1,200 to 1,800 revs. per min.—C.G.G.]

There are several ways in which to taper a tube. A method much in use is that of swaging, but this is a most unsatisfactory way, as the tube is not kept round whilst being reduced. Swaging tools cannot be quite circular, as a certain amount of "backing off" must be given to them, or the tube will be pinched and crumpled. The continued deforming of the tube during this operation causes it to split if it is much reduced, and the steel is left brittle. Tapering is more successful if done on rolls, as it is then possible to keep the tube round, and the steel is left in a much better condition. In reducing the tube by tapering it is

thickened in gauge roughly by about two gauges in a reduction of 50 per cent. of its diameter. A tube of 1⅛ in. by, 20-gauge would thicken to 18-gauge if tapered down to 9/16 in. diameter. If uniformity of gauge be aimed at, it would be necessary to thin the tubing before the tapering operation. This can be done by drawing. It is even possible to make a tube tapering both in diameter and thickness if such is required.

Tubular Liners or Reinforcements.

Considerable attention has been given to the matter of liners as reinforcements to tubes. In cases of trapped or flattened ends of struts a piece of strip steel is often inserted and soldered or riveted into position. This is not good practice, as the tube is not strengthened beyond the point at which it is flattened, and it is well known that, without some additional strengthening, a tube is always weakest at the point where the change of shape begins.

If, before flattening, a tubular liner of a gauge equal to about half the thickness of the piece of strip steel is inserted to extend some distance beyond the trapped portion, a much better result is obtained. Various compression tests have been carried out from time to time, and the tubular liner has always proved to be superior.

A liner, however, to be really efficient, should be brazed or soldered to the tube. A series of alternating stress tests has proved this point. Many liners used in tubular constructional work are not fixed, and consequently do not prevent the tube breaking, but may be sufficient to avoid accidents resulting from such breakages. Take, for instance, a front fork tube on a motor-cycle. The liner, often a long one, is put in because this tube has frequently failed at the lugs, and serious accidents have occurred, but the position of the liner in the fork makes it very difficult to solder or braze in its place. However, if a fork tube should break, the liner will save the situation.

It is not wise to make a liner stronger than the tube it is to reinforce unless the ends of the liner are tapered off gradually or weakened by serrations. When the ends are serrated and the liner is not brazed or soldered into the tube, this serrated portion is seldom of any value, as it quickly takes a "set" away from the tube when it has been subjected to a bending stress.

Perhaps the better way to reinforce tubular parts is by means of strengthening "sleeves" brazed or soldered to the outside of the tube. Although in appearance not so neat as when an internal liner is used, there is the certainty of being able properly to fix the sleeve in position.

A tube 1 in. by 20-gauge in which a hole had been drilled was reinforced by a sleeve (in halves) 2½ in. long by 18-gauge thick, pressed into position over the hole by the grips of the chuck which held it. This tube was subjected to an alternating stress test at 400 revolutions per minute. The sleeve expanded at the ends under the test and gradually became so "bell-mouthed" as to be of little practical use. The tubes fractured across the hole at 9,320 revolutions. Another tube cut from the same length and similar in all respects had the sleeve soldered in position. This tube did not break until after 43,867 revolutions had been made, and then it failed between the sleeve and the grips.

Another piece of tubing, also from the same length, having a plain hole drilled through and not reinforced at all, failed across the hole after 3,684 revolutions.

The following is a tabulation of the results just described:—

Sleeve pressed on only	9,320 revs.
Sleeve soldered on	43,867 ,,
Without sleeve	3,684 ,,

These tests point to the fact that a sleeve merely pressed into position has little value, but that when fixed to the tube by soldering or similar means it acts as an efficient reinforcement.

Three types of reinforced tubes were then shown by Mr. Hackett. All these are familiar to readers of the cycle, motor, and aeronautical papers for the past nine years or more. Mr. Hackett continued:—No. 1 is formed by drawing a round tube over two "D" section tubes. The tubes are firmly fixed together by drawing, but are not brazed or soldered. These combinations were designed to take the place of butted tubes in motor-cycle frames, which were failing through excessive vibration. Tests made on a shock-testing machine proved that this form of tubing had a much longer life under shock and vibration than plain tubing of the same weight. When a fracture occurred under test, which was always after a greater number of blows than the plain tube would sustain, it was only the outer member that was affected, the two "D" tubes being quite sound.

No. 2 is a triangular reinforcement formed by drawing an outer tube over three other tubes of the shape indicated in the sketch.

No. 3 has a cruciform reinforcement formed by four inner tubes.

A number of tests were carried out at the time on laminated tubes, formed by drawing one light tube over another, to take the place of a tube of the same weight as the two combined. Under the few tests made the laminated tubes withstood vibration and shock much better than the plain heavy-gauge tube. The only reason we can assign for this is that cold drawing hardens the outside of the walls of the tube more than the centre if the tube is a thick one, and by drawing together the two thin tubes to give the same thickness of wall the metal has the benefit of the double drawing operation. Further tests are necessary to prove or disprove this point.

(To be continued.)

The King and Queen escorted round his works by Major Gordon Watney.

A ROYAL VISIT.

The King and Queen, accompanied by Princess Mary, on April 26th, visited the works of Messrs. Gordon Watney and Company, which, since the war began, have been engaged almost exclusively in the manufacture and repair of aeroplane engines. At the works they were received by Major H. G. Watney, the managing director, who presented the Hon. H. Cavendish Butler, chairman; Mr. C. R. C. Petley, Lt. B. W. A. Watney, general manager; Mr. J. W. Dews, chief engineer; Mr. C. Tankerville Chamberlaine, assistant general manager; Mr. B. Zillwood, works manager; and Mrs. G. W. Goary, the matron. Lt.-Colonel I. B. Davson, Mr. A. B. Chorlton, and Lt. P. Swain, R.N.V.R., represented the Ministry of Munitions and the Air Ministry.

The King and Queen displayed great interest in the works and particularly in the workers, to many of whom they talked in the course of their tour.

Among the departments visited were a number of machine shops, fitting shops, assembling departments, and packing departments. Engines in various stages of completion were examined and a large number of completed engines in store. Practical demonstration was given of the power of 80 h.p., 100 h.p., 130 h.p., and 160 h.p. engines, seven of which were shown running on the test stand.

As the Royal visitors came out of this department a completed aeroplane was making a test flight only about 300 ft. above their heads, and the pilot gave a marvellous exhibition of skill.

The canteen was visited, and in all the departments a cordial welcome was given to the King, Queen and Princess. In the shops where men were employed the demonstration usually took the form of hammering upon the benches as the Royal visitors were leaving. On leaving the Royal party expressed the pleasure and interest they had found in their visit.

MARKET TOPICS.

(Prices are for quantities on usual terms.)

May 2nd, 1918.

COPPER.—There is no change whatever in prices, and supplies are being well maintained, although the output of Copper in U.S.A. has not reached the maximum figure possible.

It is very unlikely that there will be any alteration in prices at present.

Prices.

Standard	£110 0 0
Electrolytic	£125 0 0 to £121 0 0
B.S.	£123 0 0 to £119 0 0

TIN.—Prices are reaching a most abnormal figure, having advanced over £20 per ton in a week. Very little tin has been received recently and there is not much being bought by English buyers in Eastern markets to replenish rapidly depleting stocks, owing to the prices which are being demanded.

The position in U.S.A. is very desperate and buyers appear to be keenly buying up any available stocks in the East irrespective of prices. The situation is most complex, speculation in the East is uncontrolled and it does not appear to be possible for prices to assume a reasonable level until some arrangement has been made with sellers in the East.

There are rumours of changes taking place in the system of controlling supplies here.

Comparative Prices.

April 25th	£350 0 0 per ton.
April 19th	£330 0 0 per ton.
April 17th	£327 0 0 per ton.
Highest price, 1917	£309 0 0

LEAD.—Munition firms are being kept supplied, but supplies are not too satisfactory. Prices remain unaltered.

STEEL.—The demand for all classes of Steel shows no signs of diminishing, supplies are, however, very satisfactory. H.S. Steel is more difficult to procure and buyers are advised to look a long way ahead.

It is understood that the Ministry is considering an application for an increase in the maximum prices for Steel, and it is more than likely that the application will be successful, their decision is expected during the next few days. Official prices remain unaltered.

TIMBER.—There is no doubt whatever that everyone connected with aircraft work realises that the country is faced with a most serious crisis. The use of a certain substitute timber has been officially prohibited for any parts whatever, and it is stated that machines in France having units built up of this timber have been dismantled and the wood taken out, and contractors having machines in progress have been compelled to do the same.

The outlook was never more grave, and, seeing that the output of aeroplanes depends upon ample supplies of suitable timber being available, it will be apparent to the uninitiated that the position of this country so far as aeroplane output is concerned is most critical.

Further regulations have been issued governing the purchasing of timber outside the United Kingdom. It is also pointed out that a further order will be issued shortly, regulating the use of timber in this country whether bought outside or inside the United Kingdom. Particulars of the Order are printed elsewhere.

Mahogany is a little more difficult to procure. Prices are unaltered.

FABRIC.—The position is unaltered and prices remain the same.

NEW IMPORT REGULATIONS.

T. 24847.

The Timber Order, 1918, dated April 25th, 1918, made by the Board of Trade, pursuant to Regulations 2 E. and 2 JJ. of the Defence of the Realm Regulations.

The Board of Trade, deeming it expedient to make further exercise of their powers under the Defence of the Realm Regulations as respects timber, hereby order as follows:—

1. Until further notice, no person shall in the United Kingdom, buy, sell, or receive, or enter into any transaction or negotiation in relation to the sale, purchase, or transport of any timber grown outside the United Kingdom which is not actually in stock in the United Kingdom at the date of this Order, except under and in accordance with the terms of a permit granted by or on behalf of the Controller of Timber Supplies, subsequent to the date of this Order.

2. Infringements of this Order are offences against the Defence of the Realm Regulations.

3. This Order may be cited as the Timber Order, 1918.

(Signed) H. Llewellyn Smith.
A Secretary to the Board of Trade.

Board of Trade, S.W.1.

Board of Trade Announcement to Accompany Timber Order, 1918.

The Board of Trade direct the attention of all persons in this country concerned with dealing in timber of any kind outside the United Kingdom to the terms of the Timber Order, 1918, published in the "London Gazette" for April 26th. Under this Order, a permit is necessary from the Controller of Timber Supplies, Board of Trade, Caxton House, Tothill Street, Westminster, London, S.W.1, before entering into any transaction relating to timber grown outside the United Kingdom, and not actually in stock in the United Kingdom.

A permit is also necessary before receiving or arranging for the transport of any such timber not in stock in the United Kingdom. Holders of licences to import are not excepted, and must apply to the Controller of Timber Supplies before arranging for the charter of tonnage or taking delivery of timber purchased abroad.

The present Order will, it is expected, be followed before long by another, regulating not only dealing in timber, but also its use in this country, whether grown outside or inside the United Kingdom. Virtually, the entire importation of timber will be effected on account of the Government, this arrangement following upon prolonged negotiations between the Controller of Timber supplies and representatives of the timber trade.

The Timber Order, 1918, is not designed to interfere with the normal business of firms established in the Dominions or Colonies as timber producers, but is intended to prevent speculative transactions in timber in the countries of origin by or on behalf of persons in the United Kingdom.

Copies of the Order will shortly be on sale through newsagents or booksellers, or direct from His Majesty's Stationery Office, Imperial House, Kingsway, London, W.C.2.

Board of Trade, April 25th, 1918.

A GALLAY FESTIVITY.

The Gallay Radiator Co., Ltd., held a Dinner on April 26th at Frascati's to commemorate the attainment of a production of —— radiators per week.

Capt. Kennedy, in a very interesting speech, complimented the management and the staff upon the fine quality of work which they had been doing in conjunction with the high rate of output which had been reached, and referred to the fact that there had been less friction with the sheet-metal workers in this country since the war began than with the men in any other trade. Certainly, there has been very little friction between the Gallay Company's Managing Director, Mr. Delaney, and his men; and after witnessing once more on Saturday night the very cordial relations which exist between his men and himself, one is inclined to think that Mr. Delaney is quite an ideal employer.

The Gallay Company are not content to rest upon their laurels, as it was several times mentioned during the evening that they intend to redouble their efforts with a view to re-doubling their output.

After dinner there was an excellent musical programme, which, unfortunately, had to be cut rather short, owing to the lighting restrictions.

THE OPERATION OF PRODUCER-GAS PLANTS.

Aircraft constructors who are interested in works power plant are recommended to apply to the Vacuum Oil Co., Ltd., Caxton House, Westminster, S.W.1, for a copy of an illustrated pamphlet issued by this firm on the subject of vertical gas engines. This pamphlet describes very clearly with the aid of the most elaborate and beautifully executed coloured diagrams the operation of the stationary gas engines and the method in which producer gas is made.

CURRENT TOPICS.

THE NEW TAXATION.

Although the additional taxation imposed by the Chancellor of the Exchequer was not nearly so drastic as was in many quarters expected, the Budget demands coupled with the uncertainty of the effect on general industry of the working of the Man Power Bill has had the not unnatural result of an important depreciation in the market value of securities.

The usual statement published in the "Bankers' Magazine" dealing with the movement in Stock Exchange values between March 18th and April 18th shows an all-round depreciation amounting in the aggregate to a very considerable sum notwithstanding that some improvement is noted in British funds and in certain Bank and Railway shares.

Dividends Free of Tax.

It is a curious fact that the general investing public show a keen demand for shares on which the dividends are paid "free of income tax." Not unnatural, perhaps, in the present existing circumstances. It is, however, necessary to point out that with the exception of the tax-free War Loan there is no other security whose holders can avoid paying income tax. The statement free of income tax is therefore an anomaly.

The company paying dividends free of tax simply means that the company provide the tax and consequently the shareholder receives a corresponding amount less by way of dividend. The shareholder is not a scrap better off, and in point of fact may be so much worse off if he happens to be an individual not liable to pay the full rate of income tax, and investors would be well advised not to follow blindly what appears to be a new vogue.

AERIAL MAIL SERVICE COMPANIES.

Several projects are mooted for establishing companies to undertake the transport of mails by aircraft, and particulars were published last week of the Scandinavian Company to ply between Aberdeen and Copenhagen, which is already practically a *fait accompli*.

Naturally, Great Britain and her Allies are at present utilising every form of aerial transport for the exigencies of the military demands and requirements, and these countries are consequently for the moment debarred from inaugurating anything along these lines, although it is common knowledge that there are quite a number of machines which do not come up to the standard required for Government work and others that are obsolete which might well be set aside and utilised by private concerns for assisting the present congestion of transport. In the meantime the neutral countries continue to set the pace in this field of enterprise.

New Developments.

The latest is a Dutch company which will start operations by establishing an inland aerial postal service between Amsterdam and Groningen, and is discussing the project of establishing a regular aerial postal service between Rotterdam and England.

The Director General of Posts and Telegraphs of Holland has already opened up communications with the British authorities on the subject, and news of an accord may shortly be announced.

Whilst the moment may not be opportune to organise a company for such purposes in this country it would be well for those interested not to totally neglect consideration of the subject, or when the time for action does come British aircraft manufacturers may find themselves hemmed in.

COMPANIES ANNOUNCEMENTS.

NEW COMPANIES REGISTERED.

The files of the following new companies are available for inspectiin at Somerset House.

A. & H., Ltd.—Private Company. Registered March 25th. Capital, £3,000 in £1 shares. Manufacturers of and dealers in animal-drawn and motor vehicles and accessories, engines, aircraft, motor boats, submarines, torpedoes, munitions, tools, etc., The subscribers (each with one share) are: P. W. Mall, 28a, Basinghall Street, E.C.2, accountant; L. A. Carter, 113, Bravington Road, Maida Hill, W.9, clerk. The first directors are: F. R. Heyman and F. H. Arnott (joint managing directors). Registered offices, 33, Grange Road, Willesden Green, N.W.

British Emaillite, Co., Ltd.—Private Company. Registered April 22nd. Capital, £100,000 in £1 shares. To take over the business of manufacturers and dealers in dope for aircraft formerly carried on by a company of the same name (now in liquidation), etc. The subscribers (each with one share) are:—E. J. Toomey, 18, New Street, S.W.1, bookkeeper; W. R. Prentice, 30, Regent Street, S.W.1, ex-officer mercantile marine. Permanent director: W. R. Prentice. Registered office: 30, Regent Street, S.W.

General Aeronautical Co., Ltd.—Private company. Registered April 22nd. Capital, £30,000 in £1 shares. To take over the business of manufacturers of and dealers in aeroplanes and parts thereof, and in particular propellers and airscrews, formerly carried on by a company of the same name. Incorporated in 1914. The subscribers (each with one share) are:—E. J. Toomey, 18, New Street, S.W.1, bookkeeper; W. R. Prentice, 30, Regent Street, S.W.1, ex-officer mercantile marine. Permanent director: W. R. Prentice. Registered office: 30, Regent Street, S.W. Qualification: One share.

Henry Arrault, Ltd.—Private Company. Registered April 23rd. Capital, £5,000 in £1 shares. To take over the business of a school of motor and aircraft driving, repairing, constructing and managing carried on at 51, York Terrace, Regent's Park, N.W., as "Hy Arrault." The subscribers (each with one share) are: Hy. Arrault, 51, York Terrace, Regent's Park, N.W., engineer in aeronautics; A. D. Mackenzie, Harewood House, Hanover Square, W.1, gentleman. The first directors are: Hy. Arrault, A. D. Mackenzie and A. J. Stevens. Solicitors: Stevens and Flinn, Farnham, Surrey.

Moore Radiator Tube Co., Ltd.—Private Company. Registered April 20th. Capital £2,000 in £1 shares. To take over the business of tube makers carried on by F. Moore and E. Buckler, at 62, Gooch Street, Birmingham, as the "Moore Radiator Tube Co.," and to carry on the business of mechanical, electrical and general engineers, aircraft manufacturers, shippers, etc. Agreement between F. Moore, T. W. H. Jones, and E. Buckler. The subscribers (each with one share) are:—

T. W. H. Jones, 18, Milford Road, Harborne, Birmingham, director.

F. Moore, 18, Lee Bank Road, Edgbaston, Birmingham, tube drawer.

E. Buckler, 83, Parade, Sutton Coldfield, tube drawer.

The first directors are:—F. Moore, T. W. H. Jones, and E. Buckler. Registered office: 62, Gooch Street, Birmingham.

Standard Air Press, Ltd. Private company. Registered April 22nd. Capital, £1,000 in £1 shares. To carry on the business of printers and publishers of newspapers and periodicals, etc., and to enter into an agreement between the Aeronautical Institute of Great Britain and Blin Desbleds of the one part and C. Fearnley of the other part. The subscribers are:—Col. Maude, C.B., R.E., 75, Perham Road, W.14, 5 shares; Blin Desbleds, 23, Flood Street, Chelsea, S.W., engineer, 5 shares. The first directors are to be appointed by the subscribers. Registered office: 3, Arlington Street, W.

MORTGAGES AND CHARGES.

W. H. Allen Son & Co., Ltd.—Mortgage registered April 9th, 1918. £160,000 in favour of the solicitor for H.M. Treasury and Munitions Department charged on the general assets of the company.

SATISFACTIONS.

Glendower Aircraft Co., Ltd.—Satisfaction filed April 11th, 1918, of all monies due registered May 24th, 1917.

A. V. Roe & Co., Ltd.—Satisfaction filed April 11th, 1918, of £20,000 registered June 27th, 1916, and of £30,000 registered August 13th, 1917.

COMPANIES WINDING UP.

British Emaillite Co., Ltd.—Resolved to reconstruct the company, and for this purpose the company be wound up. Liquidator, Mr. J. Friends, 43, Torridge Road, Thornton Heath (accountant), who is authorised by special resolution passed April 5th, confirmed April 22nd, to consent to the incorporation of a new company with similar title.

General Aeronautical Co., Ltd.—Resolved to reconstruct the company, and for this purpose the company be wound up. Liquidator, Mr. J. Friends, 43, Torridge Road, Thornton Heath (accountant), who is authorised by special resolution passed April 5th, confirmed April 22nd, to consent to the incorporation of a new company with a similar title.

Collision in a Snowstorm. The Only Survivor's Sight Saved by "TRIPLEX"

10th February, 1917.

Dear Sirs,

These "Triplex" Goggles have undoubtedly saved my eyesight, as I fell a distance of 350 feet while on duty in France.

The accident was caused by the collision of two machines in a snowstorm. The severity of the accident is evident by the fact of both pilot and observer in one machine being killed, and the observer in the other; I being the only survivor.

Yours truly,
Capt.....R.F.C.

FROM THE COURT CIRCULAR.

Windsor Castle, May 2nd.

The King, attended by Comdr. Sir Charles Cust, Bt., R.N., and the Earl of Cromer, paid a visit of inspection to the Royal Air Force Armament School at Uxbridge this morning.

His Majesty was received on arrival by Colonel A. C. H. MacLean and Staff.

Brig.-Gen. J. G. Hearson, Director of Training, Royal Air Force, was also in attendance.

Windsor Castle, May 4th.

The following Officer had the honour of being received by His Majesty at Buckingham Palace, when the King invested him with the Insignia of the—

Distinguished Service Order.—Lt.-Col. the Hon. Anthony Byng, R.A.F.

The King then conferred the following decorations :—

A Bar to the Military Cross.—Maj. Percy Sherren, Can. Inf. and R.A.F.

The Military Cross.—Capt. Raymond Brownell, R.A.F.; Capt. Frank Gorringe, R.A.F.; Lt. Arthur Cooper, R.A.F; Lt. David Hurr, Middlesex Regt., attd. R.A.F.; Lt. Maurice Milsom, Royal Fusiliers, attd. R.A.F.; Lt. Lyell Spence, Can. F.A., attd. R.A.F.; Lt. William Wallace, R.A.F.; Sec. Lt. John Manicon, R. W. Surrey Regt., attd. R.A.F.

OFFICIAL COMMUNIQUES.

NAVAL.

May 6th.—During the period April 29th-May 5th inclusive, Air Force contingents working from Dunkirk carried out bombing operations against Ostend, Westende, Zeebrugge Mole, lock gates, seaplane base, and enemy shipping in the vicinity.

Direct hits were obtained on the Mole and seaplane base and on the docks at Zeebrugge.

One of our machines failed to return.

In the course of offensive patrols one enemy two-seater machine was destroyed and another driven down out of control.

* * *

The following account, which may be Naval official, is from the "Times" of May 7th :—

The birds of the Naval Pigeon Service, numbering several thousand, have long since taken a recognised place in the war, and have repeatedly been the means of saving lives at sea.

An air patrol fell in with some German seaplanes, and messages were received at a seaplane station in Flanders. The first was :—"Short shot down 10 miles N.N.E. Nieuport. One Hun down. My tanks shot. French t.b.d. on its way. Send fighters quick." Then followed another pigeon with :—"Am shot down. Hit in tank radiator. Observer dead. Am unhurt. turning over to port. Have jettisoned everything. Am on wing tip. Sea calm. Machine has seemingly steadied. Nothing in sight. I think machine will float a long time. Send small craft at once. Land 'bus has just made one circuit, but I don't think he saw me. My love to my mother. Tell her I am not worrying. If machine sinks I will swim to a buoy close by."

Ninety-five per cent. of messages sent by pigeon have been delivered.

MILITARY.

G.H.Q. Communiqués.

April 30th, 8.50 p.m.—On the 29th inst. low reconnaissance work was again carried out by our aeroplanes.

East of Locre the enemy's troops offered good targets to our pilots, who dropped 275 bombs on them, and engaged them with machine-gun fire.

Seven hostile machines were brought down in air fighting, and one other was shot down by our infantry.

Two of our aeroplanes are missing.

May 1st, 8.30 p.m.—On April 30th mist and rain again prevented flying, except for a few low reconnaissances, in the course of which bombs were dropped on the enemy's troops between Locre and Voormezeele.

One hostile machine was driven down and forced to land behind our lines.

One of our aeroplanes is missng.

May 2nd, 9.4 p.m.—On the 1st inst., the unfavourable weather continued, and only short-distance reconnaissances, carried out by our aeroplanes at a very low height, and bombing were possible.

None of our machines is missing.

On the 2nd inst. a ton of bombs were dropped on the railway station and sidings at Thionville. One burst was seen on the Carlshutt Works, where a fire was started. Several bursts

HONOURING THE DEAD. The funeral of Rittmeister Freiherr Manfred von Richthofen. Flying officers formed the bearer party; Australian infantry the firing party.

were observed on the barracks and on the railway station and sidings.

All our machines returned.

May 3rd, 9.28 p.m.—Although the weather was fine on the 2nd inst., a thick haze interfered with the work of our aeroplanes and artillery.

Several important reconnaissances were carried out, and many photographs were taken well in rear of the enemy's lines. Three and a half tons of bombs were dropped on Bapaume and other targets in the battle areas.

At times fighing in the air was severe. Fourteen hostile machines were brought down and four others were driven down out of control.

Five of our machines are missing.

During the night five and a half tons of bombs were dropped by us on Chaulnes, Juniville railway junction, Bapaume, and Caix.

Three very heavy bombs were dropped also from a low height on the lock gates at Zeebrugge.

On the 3rd inst. another most successful raid was carried out by us against the railway station and sidings at Thionville. Carlshutte works were again hit, and several bursts were seen on the station, in the sidings, and on the gasworks.

All our machines returned.

May 4th, 9.25 p.m.—On the 3rd inst. a most successful day's work was accomplished by our aeroplanes. Reconnaissances were carried out over all important areas, and a great many photographs were taken. Good visibility assisted the co-operation of our aeroplanes with the artillery.

Bombing was carried out with the utmost vigour, and a total weight of over 20 tons of bombs was dropped on Chaulnes, Tournai, and La Bassée railway stations, and on Estaires, Marcelcave, Menin, Comines, and Middelkerke.

Fierce fighting continued all day. Twenty-eight German machines were brought down and five others were driven down out of control. In addition, our anti-aircraft guns shot down three of the enemy's machines within our lines.

Eleven of our aeroplanes are missing.

After dark a thick mist set in on most parts of the front. Over two tons of bombs were dropped by us, however, on Chaulnes and Juniville railway junctions. In spite of the very bad weather encountered, all our machines returned.

May 5th, 9.31 p.m.—On the 4th inst. there was a dense mist till the afternoon, when the weather cleared slightly. Reconnaissances, photography, and bombing were carried out. Nine tons of bombs were dropped on Chaulnes railway junction, on Bapaume, Armentières, Merville, and Estaires.

There was very little fighting in the air. One hostile machine was brought down by our aeroplanes, and four others were driven down out of control.

Two of our machines are missing. Two of our aeroplanes, which were reported missing on the 3rd inst., have since returned.

After dark, although the weather continued to be unfavourable for flying, over three tons of bombs were dropped on Chaulnes railway junction and Bapaume.

All our machines returned.

May 6th, 9.5 p.m.—On the 5th inst., beyond a few low reconnaissances and some bombing, no work in the air was possible owing to rain and mist.

War Office Communiqués.

May 3rd.—The G.O.C. Italy reports:—

Following a prolonged period of incessant rain and mist, fine weather has at length set in. Patrol activity on both sides has been considerable; we have captured several prisoners. Much counter-battery work is being carried out, and a number of explosions have resulted in the hostile battery positions.

Since my last report the Royal Air Force have destroyed 12 enemy aeroplanes, with a loss of three machines themselves. This brings the total number destroyed since the arrival of the British forces in Italy up to 109.

Our loss in the same period has been 13 machines.

May 4th.—The G.O.C. Palestine reports:—

Throughout May 2nd fighting continued east of the Jordan at and to the south of Es Salt.

Our air service attacked troops and rolling stock on the Hedjaz Railway in the vicinity of Amman (15 miles south-east of Es Salt), and in the Wadi Sir (midway between Es Salt and Amman) with bombs and machine-gun fire.

Two of our machines failed to return.

PERSONAL NOTICES.

NAVAL.

DEATHS.

BATES.—Flt. Lt. Cyril Montague Bates, R.N.A.S., who died as the result of an accident whilst flying on April 24th, was the only son of Mr. and Mrs. P. M. Bates, of Surbiton. He was 18 years of age.

DUNFEE.—Flt. Sub-Lt. W. V. Dunfee, R.N.A.S., who was killed on active service on May 1st, was the only son of Mrs. W. L. Dunfee, 56, Church Crescent, Finchley, N.3. He was 18 years of age.

MEARS.—Flt. Sub-Lt. Henry Frank Mears, R.N., was killed whilst flying on April 29th. He was 18 years of age.

MILLAR.—Capt. Gilbert Henry Millar, R.A.F., who was accidentally killed while flying on April 29th, aged 33, was the third son of the late Henry E. Millar and Mrs. A. M. Millar, of Heathdown, Hampstead Heath, N.W. He was a scholar of Rugby and of Pembroke College, Cambridge, and took a double first in the Mathematical and Mechanical Triposes. Subsequently he joined the staff of the National Physical Laboratory. He was an accomplished yachtsman, and on the outbreak of war he joined the R.N.V.R. He was sent to Antwerp in Oct., 1914, was taken prisoner in the retreat, and was interned at Döberitz until Sept., 1915, when he effected his escape, in which he showed great courage and resource. On his return home he was given a commission in the R.N.V.R., being seconded for air duties, and was employed in both theoretical and practical work, qualifying as a pilot. In June, 1917, he was transferred to the R.N.A.S. as an observer with the Fleet.

* * *

The "Times" correspondent reports on May 2nd that Flt. Lt. A. T. N. Cowley, R.N., and Flt. Lt. C. G. Knight, R.N., have arrived in Holland from Germany for internment.

* * *

Mrs. Frank Brock wishes to express her grateful thanks for the numerous letters of sympathy she has received, and trusts everyone will understand how difficult it is to reply.

MILITARY.

DEATHS.

ASHWORTH.—Lt. Roger William Ashworth, Hampshire Regt., attd. R.A.F., who was accidentally killed on April 26th whilst flying, was the youngest son of the late Thomas Ashworth, of 2, Avenue Road, Regent's Park. He was 23 years of age.

KINNEAR.—Maj. John Lawson Kinnear, D.S.O., M.C., The King's (Liverpool) Regt. and R.A.F., who died as the result of an accident whilst in Hants, was the younger son of the late Rev. H. G. Kinnear, of Copgrove Rectory, Yorkshire, and of the late Mrs. Kinnear, of Park House, Ripon. He was 28 years of age.

LAST.—Sec. Lt. Leslie Last, R.F.A., attd. R.F.C., whose death was announced recently, was educated at the King Edward's High School, Birmingham, and Westminster. On the outbreak of war he mobilised with B. Battery of the H.A.C., and served with his battery in Egypt. In 1916 he returned home to take a commission in the R.F.A., and went out to Salonika at the end of year. Ten months later he transferred to the R.F.C. After securing his wings he was appointed an instructor, and it was while flying with a pupil that he met his death.

MARRABLE.—Lt. Edmund Douglas Marrable, R.F.A., who was killed in a flying accident in Kent on April 26th, was the only son of the late Douglas Heron Marrable and Mrs. Marrable, formerly of Dorchester. He was 24 years of age.

McHATTIE.—Lt. J. W. McHattie, R.A.F., late London Scottish and York and Lancaster Regt, who was reported killed on April 25th, was the son of Mr. James and Mrs. McHattie, of Enfield.

NEEDHAM.—Cadet George Francis Jack Needham, A.F.C., who was accidentally killed whilst flying on April 23rd, was the eldest son of the late John and Mrs. Needham, of Adelaide, Australia. He was 27 years of age.

PARKER.—Capt. Charles Allan Parker, M.C., R.F.C., who was killed whilst flying abroad on Feb. 19th, was the only son of Mr. and Mrs. Erskine Parker, of Tasmania, and the brother of the Hon. Mrs. Frank Eaton.

TATTON.—Capt. Eric Hudson Tatton, East Yorks. Regt. attd. R.A.F., was the youngest of the five sons of Mr. and Mrs Tatton, of Edgware, and joined the U.P.S. Brigade in Sept. 1914. He received his commission in the East Yorkshire Regt in Jan., 1915, and was gazetted lieutenant in the same year. He saw active service in Egypt and then in France, taking part in the offensive on July 1st, 1916. Subsequently he transferred to the R.F.C., and, obtaining his "wings," he was again at the front for eight months' active service. In July, 1917, he was sent back to England, and in August was gazetted captain and flight-commander. Until March he was acting as test pilot at aerodromes in England. On March 30th Capt. Tatton returned to the front, and was killed in action on April 20th, aged 23.

THOMPSON.—Capt. Philip Thompson, R.F.C., who was reported missing on March 23rd, and is now believed to have been killed while fighting his machine on that date, was the only son of Mr. Whitaker Thompson, who was chairman of the London County Council for 1910-11. Educated at St. Aubyn's, Rottingdean, and Winchester (Mr. Aris's house), he joined the R.F.C. in April, 1916. After some months in France he was chosen for night-flying defensive service in England, but soon after being promoted captain he was again posted to a squadron at the front. He was 19 years of age at the time of his death.

WINTON.—Sec. Lt. Harold Barkley Winton, R.A.F., was

the only son of William and Edith Winton, of Beddington, Surrey. He was educated at Gore Court, Sittingbourne, and, gaining the first Old Salopian Scholarship, entered Mr. Chance's House at Shrewsbury in 1908. While there he was captain of "Fives," and represented the school at football. In 1912 he went up to Cambridge as a Benson Classical Exhibitioner of Magdalene College, with a Dr. Taylor's Exhibition from the school. He took his B.A. degree by proxy in 1915. In Sept., 1914, he enlisted as a private in the 16th Middlesex Regiment (Public Schools), and went to France in November, 1915, where he was wounded on June 28th of the following year. On August 13th, 1917, he was transferred to the R.F.C., and, obtaining his wings in February, he went to the front as a pilot on April 6th, 1918, and was killed in an aeroplane accident on April 21st. He was 24 years of age.

Engagements.

ROE—STOPES.—A marriage has been arranged between Lt. Humphrey Verden Roe, R.F.C., late of the Manchester Regt., and Marie Carmichael Stopes, D.Sc., Ph.D., Fellow and Lecturer in Palæobotany at University College, London, and the author of various scientific works.

Mr. Roe served through the South African War as a subaltern in the 1st Manchester Regiment, afterwards becoming joint founder and managing director of A. V. Roe and Co., Ltd., from which he resigned to join the R.F.C. on active service in France.

SELBY—BARTRUM.—The marriage of Capt. J. G. Selby, M.C., R.F.A. and R.F.C., and Miss Dorothy Bartrum will take place very quietly at the Chapel Royal, Savoy, on Wednesday, May 15th, at 12. All friends will be welcome at the church.

Marriages.

CORNER—WALDEN TAYLOR.—On Thursday, May 2nd, at St. Paul's Church, Winchmore Hill, N., Sec. Lt. Wilfred Geo. Corner, the King's (Liverpool) R., attd. R.A.F., sixth son of Mr. and Mrs. E. H. Corner, of 4, Arundel Square, N., was married to Muriel Walden, eldest daughter of William Jno. Taylor, of Benwell, Newcastle-on-Tyne, and granddaughter of the late Maj. T. P. Walden, R.G.A.

LEARMOUNT—BALL.—A marriage took place at St. James's Church, Muswell Hill, on Tuesday, May 7th, between Maj. Leonard Wright Learmount, D.S.O., M.C., R.A.F., only son of R. K. Learmount, of Gosforth, and Ada Elizabeth Ball, elder daughter of A. Ball, of 86, Rosebery Road, Muswell Hill, N.

Births.

BESWICK.—On May 2nd, 1918, at Kenwood, Weybridge, to Margery, the wife of Lieut. K. E. Beswick, R.F.C.—a daughter.

THOMPSON.—On April 30th, at Richmond House, Wimbledon Common, the residence of her parents, Madge, the wife of Capt. Wyvol Thompson, R.F.C.—a daughter.

* * *

Lt. Alan Reeve, Central Ontario Regt., attd. R.F.C., was reported missing on March 27th. Mrs. Jolly, 391, Unthank Road, Norwich, will be thankful for information.

* * *

It is reported that Capt. Alan Bott, M.C., R.F.C., whose writings under the pseudonym of "Contact" have given so much pleasure and education, has been wounded and taken prisoner in Palestine. He won his M.C. while flying in France.

Capt. Bott was originally on the staff of the Reuter Agency on the Continent.

* * *

News has been received that Capt. J. L. Trollope, R.F.C., who was reported missing on March 28th or 29th, is wounded and a prisoner in German hands.

* * *

The correspondent of the "Times" reported on May 2nd that the following officers have arrived in Holland from Germany for internment:—

Aked, Lt. H. L. C., W. York R., attd. R.F.C.; Atkinson, Lt. J. M., A.S.C., attd. R.F.C.; Castle, Lt. J. S., R.F.C.; Cairnduff, Lt. A., R. Mun. Fus. and R.F.C.; Golding, Sec. Lt. K. L., R.F.C.; Goodson, Sec. Lt. A. R. L., Lond. R. and R.F.C.; James, Capt. C. E. H., 2nd Welsh R. and R.F.C.; Joyce, Lt. W., Bed. R., attd. R.F.C.; Lerwill, Lt. O., R.F.C.; Littlewood, Lt. S. C. T., 3rd L. N. Lanc. R. and R.F.C.; Maxwell, Lt. G. E., R.F.C.; Mortimer-Phelan, Lt. W. C., R.F.C.; Newbold, Sec. Lt. L. A., Essex R. and R.F.C.; Owen, Capt. D., Can. Gen. List, attd. R.F.C.

AIR FORCE.

Deaths.

CARLING.—Lt. John Burleigh Carling, R.A.F., who died on May 5th in hospital at Croydon of an illness contracted after many months on active service, was the youngest son of Mr.

BIRMINGHAM.

and Mrs. Fred W. Carling; of Ottawa, Canada. He was 20 years of age.

CHEERS.—Sec. Lt. Donald Heriot Anson Cheers, R.A.F., who was killed accidentally while flying in Scotland on April 17th, joined the Army when only 15 years old, and in August, 1915, was sent to France. He was given a Commission as Sec. Lt. in June, 1917, and entered the Royal Flying Corps.

GEOPEL and WARDELL.—The machine which Serjt. Geopel and Pte. Wardell were flying at the Curragh on May 4th fell to the ground in flames. Both men were killed.

KEARNEY.—Lt. Norman Charles Kearney, R.A.F., who was killed in an aeroplane accident on April 27th, in Hants. He was 26 years of age.

LOWRIE.—Lt. Victor Wm. Volette Lowrie, R.A.F., who died on April 27th as the result of an aeroplane accident, was the only son of Mr. and Mrs. Alfred Lowrie, Lynwood, Radyr. He was 18 years of age.

McDONALD.—Lt. G. O. McDonald, R.A.F., was drowned in the Thames at Reading on May 2nd owing to the capsizing of a canoe.

MOONEY.—An inquest was held in Surrey on April 24th concerning the death of Lt. Thomas Frederick Mooney, American Air Service, whose death was announced last week. He was 23 years of age and his home is in Texas. The evidence showed that whilst flying across the district at an altitude of about 500ft. he endeavoured to climb up, but lost flying speed, probably owing to engine trouble, and crashed to earth. He dropped into a railway cutting about fifty yards from the mouth of a tunnel, and was killed instantly. The machine afterwards caught fire and was destroyed. The jury returned a verdict of accidental death.

THOMAS.—Lt. John Dobson Thomas, R.A.F., who was killed in a flying accident in Hampshire, was a son of Mr. J. J. Thomas, formerly of Messrs. Losh, Wilson, and Bell's iron-works, Walker, Newcastle-on-Tyne, and latterly connected with iron and steel works in America, and Mrs. Thomas, and grandson of the late John Dobson, R.A., architect, of Newcastle-on-Tyne. He had graduated at St. John's Military Academy and the University of Wisconsin, U.S.A.

TUNBRIDGE.—Lt. R. G. Tunbridge, R.A.F., of Great Yarmouth, was killed in a flying accident on the north-east coast on May 2nd. The wings of his aeroplane collapsed and the machine crashed to earth.

WHITEHEAD.—Sec. Lt. Eric Joseph Whitehead, R.A.F., who was accidentally killed whilst flying on May 3rd, was the eldest son of Mr. and Mrs. Joseph Whitehead, 16, Belvedere Grove, Wimbledon.

YOUNG.—An inquest was held on May 4th on the body of Sec. Lt. F. J. Young, R.A.F., whose parents live at Chelmsford. The deceased, who was 18 years of age, left his aerodrome to fly to another town, but, missing his way, he descended for information. Rising again at Broad Marston, near Stratford-on-Avon, his machine struck an elm tree and fell, bursting at once into flames. It is thought that an injury to his head rendered him unconscious before he reached the ground. A verdict of accidental death was returned.

Engagement.

PARNELL—CHINNERY-HALDANE.—The engagement is announced of Capt. Ivan William Parnell, R.A.F., son of the late John Parnell, of Rainsbrook, Rugby, and Mrs. Parnell, Tower House, Hillmorton, to Dorothy, younger daughter of Mr. Vernon Chinnery-Haldane, of Onich, Inverness-shire, and of Mrs. Vernon Chinnery-Haldane.

Marriages.

RAWLINSON—BATTEY.—On April 30th, at the Parish Church, New Malden, Lt. Arthur Stanley Rawlinson, R.A.F., youngest son of Mr. and Mrs. Rawlinson, Edge Hill, Liverpool, was married to Dulcie, the only daughter of Mr. and Mrs. Battey, Chestnut Grove, New Malden, Surrey, by the Rev. Canon Challacombe.

STAMMERS—SPENCER.—On May 1st, at St. Matthias Church, Richmond, Surrey, Maj. H. V. Stammers, R.A.F., second son of Mr. and Mrs. S. J. R. Stammers, of Beaconsfield, Gunnersbury, was married to Alice Margaret, only daughter of the late Mr. J. E. H. Spencer and Mrs. Spencer, of 18, Montague Road, Richmond, by the Rev. T. W. Moulton, vicar of Turnham Green.
